Twenty-third Annual Edition

SWEET'S ARCHITECTURAL CATALOGUE

(REG. U. S. PAT. OFF.)

An Indexed Catalogue Filing System
Containing the Catalogues of Over
1,500 Manufacturers of Building
Materials, Supplies and Equipment

Compiled, Edited, Indexed
and Distributed Annually

by

SWEET'S CATALOGUE SERVICE
DIVISION OF F. W. DODGE CORPORATION
119 West 40th Street, New York, N. Y.

Boston, Mass., Park Square Building
Philadelphia, Pa., 1321 Arch Street
Pittsburgh, Pa., Bessemer Building
Cleveland, Ohio, 1266-68 Hanna Building
Atlanta, Ga., Witt Building
Chicago, Ill., Madison-La Salle Building
Los Angeles, Calif., 309 California Building

Copyright, 1928, by F. W. Dodge Corporation

PRINTED IN THE UNITED STATES OF AMERICA BY W. B. CONKEY COMPANY, HAMMOND, IND.

PLEASE NOTE

Sweet's Architectural Catalogues are loaned for reference purposes, with the understanding that they are to be returned upon publication of the next annual edition.

In order that we may have your correct name and address to answer inquiries we receive and for the delivery of subsequent editions, please notify us promptly of all changes in firm name, address, or in the names of individuals using this service.

INFORMATION SERVICE

We have on file detailed information concerning the products of the principal manufacturers of materials used in the building and industrial fields. If you are unable to find what you desire in Sweet's, write us and we will see that you receive all the information required.

If you notice the omission of the catalogue of a firm in whose products you are interested, or find that any of the catalogues herein contained are lacking in the specific information required, please advise both the manufacturer and us of the deficiency. Such co-operation will be helpful in making subsequent editions more comprehensive and useful.

Address inquiries to our New York office:

HAMILTON MANUFACTURING CO.

Manufacturers of Drafting Room Furniture

MAIN OFFICE AND FACTORY

TWO RIVERS, WIS.

EASTERN BRANCH AND WAREHOUSE, RAHWAY, N. J.

Products

OAK and STEEL BLUE PRINT SECTIONAL CABINETS; ADJUSTABLE DRAWING TABLES; DRAWING BOARDS.

Also manufacturers of Collapsible Drawing Tables and Easels, Parallel Rule Attachments, Artists' Tables, Typewriter Tables, School Tables, etc.

Blue Print Sectional Cabinets in Wood

Built on the unit plan—add as requirements demand.

Thoroughly well made of seasoned oak and well finished. Each drawer is fitted with label holder, substantial pulls, and hood at back of the drawer.

Oak Blue Print Cabinet Units
Combination 29

Sizes—Carried in stock in two sizes. Units lettered from A to P and numbered 32 and 37.

No. 32 Units—Have drawers with inside dimensions 32x42½ in., outside dimensions 34½x45½ in.

No. 37 Units—Have drawers with inside dimensions 25x37½ in., outside dimensions 27¼x40½ in. Special sizes to order.

Bases—Bases for the above units are supplied in four different styles flush to the floor; or on legs, sanitary style.

Blue Print Sectional Cabinets in Steel

Built on the unit plan—add as requirements demand.

Substantially constructed of cold rolled furniture steel with joints electrically welded. Finished in olive green enamel, baked on. A beautiful and lasting finish that will harmonize with any surroundings.

Each drawer fitted with label holder, substantial pulls, patented paper weights, and hood at back of drawer.

Sizes—Carried in stock in two sizes. Units numbered from 1825 to 1839 have drawers with inside dimensions 25x37 in., outside dimensions of cabinet 28½x40⅛ in. Units numbered from 1843 to 1857 are 6 in. wider and 7 in. deeper.

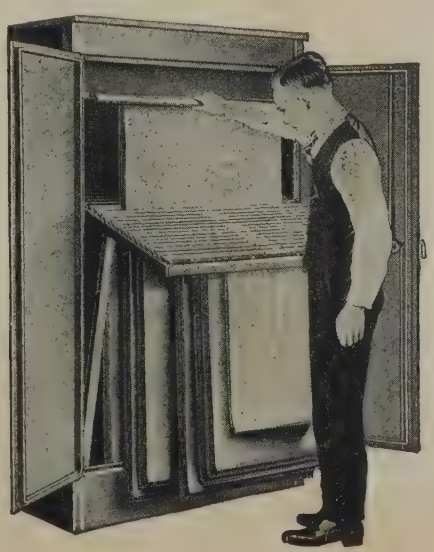
Hamilton-Calumet Vertical Planfile

For filing large records and sets of plans. Made in sizes from 24x70 in. to 48x70 in. Each cabinet has a capacity of 3000 prints, drawings or tracings.

Hundreds of these cabinets are in use in architects' and engineers' offices.

Made of steel and finished in olive green baked enamel.

Ask for booklet A Dr. B-5.



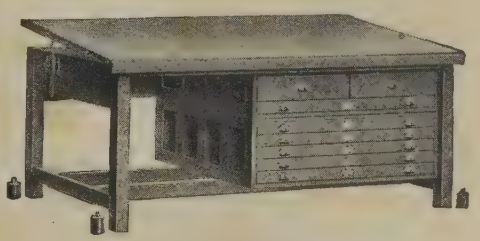
Drawing Tables

Perfection-Monroe Adjustable Drawing Tables—Adjustable in height from 31 to 41 in. Top tilting to any angle. White pine tops 23x31 to 36x60 in. with end cleats which allow for expansion and contraction of top.

A very practical, rigid drawing table at a moderate price. The diagonal braces insure rigidity.

Perfection-Monroe Adjustable Drawing Table

Tables Nos. 220 to 247—These tables are made in two different sizes, 36x72 and 42x84 in. The tops are made of selected white pine with end cleats screwed to board with oblong washers and heavy screws which allow for expansion and contraction of board. These tables will take any of our regular No. 32 or No. 37 units for filing purposes.



Drawing Table No. 234

Hamilton Steel Base Adjustable Drawing Tables—A new and unique drawing table. Base of steel—absolutely no breakage in shipment or while in use. Top of best white pine in sizes 36x48, 36x60, and 42x72 in. Adjusting device wonderfully simple, efficient, and positive.

Hamilton Steel Base Adjustable Drawing Table

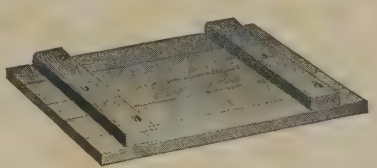
Top cannot possibly drop down accidentally. Top tilts to any angle and vertically.

Finished in olive green baked enamel, attractively striped.

Drawing Boards

We manufacture six different styles of drawing boards. Made in pine and basswood in any size.

Style D—1 1/16-in. board with 3x1¼-in. maple cleats and oblong washers staggered.



Style D, Drawing Board

Facilities and Experience

This company has had over 45 years' experience in making business furniture. It has a warehouse at Rahway, N. J. so as to insure prompt delivery in the East, as well as in the West.

Send for catalogue, H-S-E.

THE C. F. PEASE COMPANY

Blue Printing Machines and Accessories, Drafting Room and Architects' Supplies

EASTERN SALES OFFICE AND DISPLAY ROOM
12 East 44th Street
NEW YORK, N. Y.

837 North Franklin Street, corner Institute Place
CHICAGO, ILL.

PACIFIC COAST SALES OFFICE
541 South Spring Street
LOS ANGELES, CALIF.

Products

BLUE PRINTING EQUIPMENT and ACCESSORIES, which include: Blue Printing Machines; Washing and Drying Machines, single sheet and continuous type; Blue and Brown Print Paper and Cloth, sensitized and unsensitized; Blue Print Room Supplies.

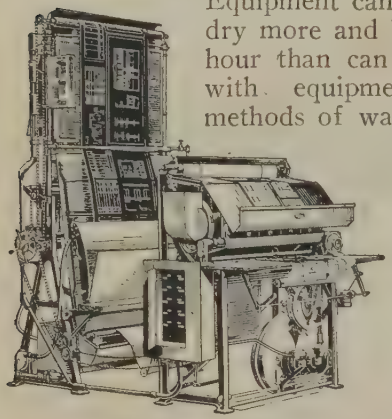
DRAFTING ROOM FURNITURE and SUPPLIES of all kinds: DRAWING INSTRUMENTS and MATERIALS of every sort; all leading brands of TRACING PAPERS and CLOTHS.

Also Engineers' and Surveyors' Instruments and Supplies.

Pease "Peerless" Continuous Electrical Blue Printing Equipment

Saves Labor, Time and Dollars—

One operator and a Pease "Peerless" Blue Printing Equipment can print, wash, potash and dry more and better blue prints in one hour than can be done in four hours with equipment using independent methods of washing and drying.



Pease "Peerless" Continuous Electrical Blue Printing Machine

Prints, Washes, Potashes and Dries—

Every operation is automatic and continuous and the Pease "Peerless" will handle up to 120 linear yards of perfect blue prints per hour at lowest possible per sq. ft. cost.

Economical for Short Runs—

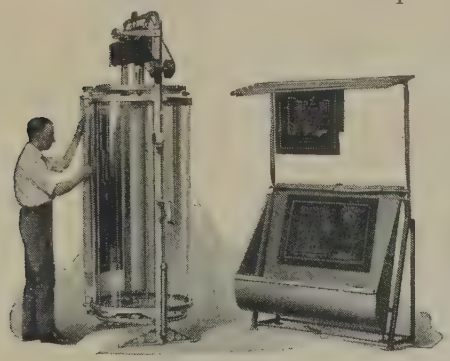
Short runs of 5 or 10 yards can be handled just as economically when required, by an operator who has other duties to perform.

Ask for Catalog MP-37.

Pease "Vertical" Blue Printing Machine and Sheet Washer

A Fast Vertical Blue Printing Machine—

Where the demand for blue printing does not warrant the purchase of a Pease "Peerless" Continuous Equipment, the Pease "Vertical" Blue Printing Machine and Sheet Washer meets every blue printing requirement, except continuous production.



Pease "Vertical" Electrical Blue Printing Machine and Pease Sheet Washer

Machine is made in ten sizes and is equipped with a Pease UV Universal High Power Arc Lamp which gives absolutely uniform results, with fastest printing speed. The Pease Sheet Washer is made in three sizes and completely eliminates open bath trays, dripping prints and wet floors.

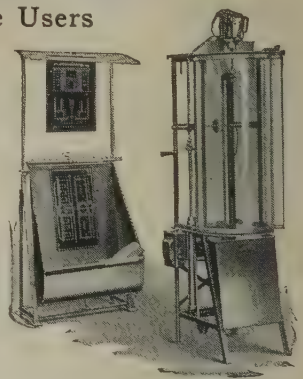
Ask for Catalog MV-37

Pease "Junior" Vertical Blue Printing Machine and Sheet Washer

For Moderate Users of Blue Prints—

Completely eliminates old unreliable makeshift or sun frame methods and will furnish clear and distinct blue prints in any size up to 24x36 inches in from one to one and one-half minutes. Similar in design to the larger Pease Vertical Machine, can be stood in a corner of the drafting room, and can be connected directly into the lighting circuit. Initial investment is small and maintenance expense is reduced to a minimum.

Ask for Catalog MJ-37.



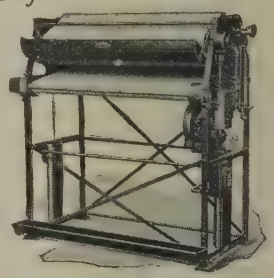
The Pease "Junior"
Machine operates on either 110 or 220 volts A-C. or D-C. and requires a floor space of 25x26 in. The sheet washer requires a floor space of 24x34 in. and is equipped with spray pipe and drain pipe

Pease Sheet Dryer

No Waiting for Prints to Dry—

Dries dripping wet prints perfectly at the rate of 8 linear feet per minute. Either electric or gas heating element can be furnished and Pease Dryers are equipped with copper cylinder to which prints will not adhere. An inclined feeding apron eliminates steam pockets and resultant creased prints while the automatic band control constantly regulates traveling of the band. Made in 22, 45 and 57-inch widths.

Ask for Catalog SD-37.



Pease Sheet Dryer
With gas heater, thermostatic heat control and automatic band control. Electric heating element can be furnished if desired

Pease Blue Print Paper

Guaranteed Rag Stock—

Pease Blue Print Paper is coated in four printing speeds and all rolls are guaranteed to contain exact rag stock specified and be of full measure and in one piece. Pease Paper has a high folding test, excellent permanency and is the nearest non-fading blue print paper in existence.

Ask for Catalog BP-37.

Pease Drafting Room Furniture and Drafting Room Supplies

Includes both steel and wooden, sectional, horizontal and vertical filing cabinets; drawing tables; drawing boards; draftsmen's stools and drawing materials, briefly—"Everything for the Drafting Room."

Ask for Catalog F-37.

Pease Filing Cabinet

Catalog G-37

Ask for your copy.

Contains complete illustrations and descriptions of the full line of Pease Blue Printing Machinery, Blue Print Paper, Drafting Room Furniture and Supplies and Architects' and Engineers' Equipment.

WICKES BROTHERS

ESTABLISHED 1856

SAGINAW, MICH.

SALES OFFICES

NEW YORK, N. Y., 501 Fifth Avenue

SEATTLE, WASH., 736 White-Henry Building

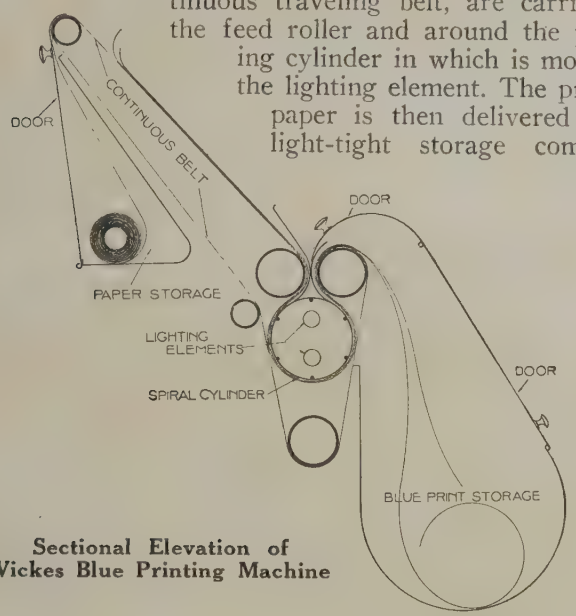
Products

Wickes Continuous Electric Blue Printing Machines.

Also builders of Standard Heavy Duty Engine Lathes, Crankshaft Lathes, Production Lathes, Heavy Duty Punches (vertical and horizontal), Shears (plate, bar, structural), Bending Rolls (horizontal, vertical, and angle), Radial Wall Drills, Flanging Clamps.

Wickes Blue Printing Machines

Operation—The Wickes continuous electric blue printing machine will print separately cut sheets or continuous rolls in any length and in widths varying from 2 to 48 in. The paper and tracing, placed on a continuous traveling belt, are carried to the feed roller and around the printing cylinder in which is mounted the lighting element. The printed paper is then delivered to a light-tight storage compartment and the tracing is returned to the operator or carried to the storage compartment, as desired.



Sectional Elevation of Wickes Blue Printing Machine

The machine is entirely automatic, the only work required of the operator being the placing of the tracing and blue print paper on the traveling belt. The entire operating mechanism is controlled by three toggle switches conveniently located for the operator, one being for the motor and one for each auxiliary, thus controlling each light on a separate starting apparatus. The operator, without changing position, can start, stop, reverse or vary speed of drive.

All wiring is in metallic conduit, the entire electrical mechanism being approved by the National Board of Fire Underwriters.

Lighting Elements—The light is obtained from two mercury vapor lamps of standard pattern. These lamps operate at a very low temperature and require absolutely no attention from the operator at any time.

Printing Cylinder—The printing cylinder which surrounds the lighting element is composed of longitudinal and spirally disposed wires, woven right-handed on one side of the center of the machine and left-handed on the other side. The cylinder is stationary and the tracing and blue print paper are carried around it by the traveling belt. The light is projected directly in a radial line through the tracing without having to pass through any intervening glass, the spirally disposed wires offering much less actual obstruction to the light than any glass cylinder would. The right and left-handed spirally woven wires impart a very desirable ironing and spreading effect to the entire surface of the tracing. The tracing and paper pass over 92% of the circumference of the cylinder.

Continuous Traveling Belt—The contact between the tracing and the paper is secured by means of a single, wide, continuous belt which passes around the feed rolls and the metallic printing cylinder. The tension of this belt is regulated automatically. Its life is guaranteed for three years' service.

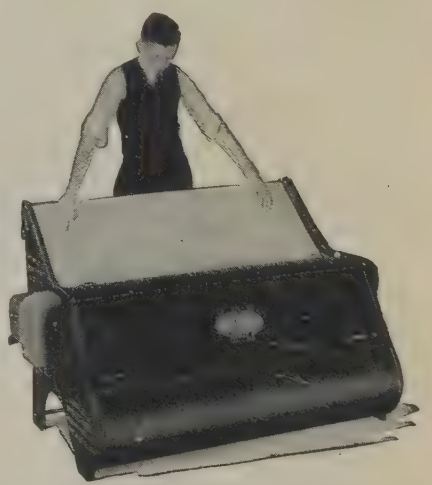
Advantages of the Wickes Blue Printing Machine—Blue prints are made with an absolutely uniform tone throughout.

The operator is not required to work in a darkened room, the light-tight compartments making this unnecessary.

The operation of the machine is so simple that any person, however inexperienced, can make perfect prints with it.

There is no glass cylinder to clean, break or replace, our metallic cylinder being self-cleaning and unbreakable.

The power required is exceptionally low; the consumption when running at maximum capacity being but .015 kw. per sq. yd.



Wickes Continuous Electric Blue Printing Machine

Model 20 Blue Printing Machine

The Model 20 machine carrying two lighting elements on separate starting apparatus has a capacity of 400 sq. yd. per 8-hour day. With the improved variable speed, 4-step, quick change gear box and adjustment of motor on iron driving disc, the printing speed can be adjusted to suit any grade of paper, including Van Dyck's. The machine is entirely self-contained; is 30 in. high and requires a floor space of 2 ft. 6 in. x 5 ft.

Model 15 Blue Printing Machine

The Model 15 machine is constructed exactly like the Model 20 except that it carries only one lighting element, decreasing the printing speed about one-half. It is so constructed that another lighting element can be added at any time as required, thus changing it to a Model 20 machine.

Catalogues

Catalogues fully describing the Wickes blue printing machines will be sent on request.

General Engineering Service

CONSULTATION SERVICES in all ENGINEERING FIELDS: MECHANICAL, CIVIL, HYDRAULIC, ELECTRICAL and CHEMICAL.

The SUPERVISION and DETAIL INSPECTION of CONCRETE CONSTRUCTION, including EXAMINATIONS and REPORTS upon the SUITABILITY of AGGREGATES.

SOIL TESTS, TEST BORINGS and REPORTS upon the SAME in CONNECTION with FOUNDATIONS.

Also, Reports on Permissible Floor Loads and on Existing Conditions of Buildings and other structures.

Testing, Physical, Chemical and Machinery

Strength tests of materials and systems of construction—steel, iron, cement, brick; columns, beams, floor slabs, partitions and other members.

Chemical tests of all building materials, including steel, iron, cement, paint, oils, slags, limestones, marls and clays.

Duty and efficiency tests of entire plants—engines, boilers, pumps, compressors and other machinery.

Structural Steel Inspection

The inspection of structural material at the mills and foundries, including the identification and witnessing of physical tests.

The supervision and inspection of workmanship, checking the sections, dimensions and detail connections during the course of fabrication at the shops, insuring the proper handling of the material, first class workmanship, accurate construction, thorough painting and distinct marking, thus facilitating the erection at the site.

Estimation of weights from detail drawings, and checking shipped weights of finished work.

The supervision and detail inspection of the structure during erection.

Cement Inspection

The testing of cement, including the sampling in car load or bin lots, at the mills or warehouses or when delivered on the work, and the identifying of each lot with serially numbered blue tags.

Complete cement and chemical laboratories in connection with cement testing at Chicago, New York, Pittsburgh, St. Louis, Kansas City, San Francisco, Birmingham, Montreal, Toronto, Vancouver and London.

Soil Tests, Test Borings and Reports

The scientific method of determining areas of foundations, permissible loads per square foot and the probable ultimate settlement under load, based on an analysis of direct soil loading tests and borings, as compared with our records of the results of similar investigations.

Specification Forms

The following is a form for incorporation in specifications for buildings and other structures, covering the necessary arrangements for inspection and relationship between inspector and contractor:

Materials of Construction—Shall be inspected and tested by ROBERT W. HUNT COMPANY, who will act under instructions of the architect or engineer, and report to him the results of inspection and progress of the work, and otherwise facilitate prompt and early delivery of satisfactory materials. The inspectors shall also place marks of identification on accepted materials. Such inspection shall not relieve contractor from responsibility to furnish satisfactory material, but is a measure of precaution against oversights and errors. The cost of this inspection is to be borne by the contractor unless otherwise stipulated.

Structural Steel—Shall be inspected and tested at the rolling mills and also inspected at the shops during fabrication, in proper manner, to determine whether the material conforms with the plans and specifications. Contractor shall furnish inspector necessary facilities for inspecting, testing and labor for handling material.

Reinforcing Steel—Shall be inspected and tested at the mill or warehouse in proper manner, contractor furnishing, free of charge, testing apparatus and facilities for inspection.

Cement—Shall be sampled and tested before delivery to the work, in accordance with American Society for Testing Materials, or the special specifications attached.

Standard Specifications

For complete information write our nearest office and request a copy of our recent publication on "Inspection and Tests of Materials for Buildings and Structures."

Services

THE FOUNDATION COMPANY is an organization of Construction Engineers widely experienced in BUILDING DIFFICULT SUPERSTRUCTURES and SUBSTRUCTURES in all parts of the world. The enviable reputation gained in its early history for trustworthy underground construction has followed it into the field of GENERAL CONTRACTING.

THE FOUNDATION COMPANY has built buildings of nearly every known type such as offices, banks, stores, hotels, club houses, dwellings, and also the whole range of industrial buildings, power plants, etc. This company is successfully building warehouses, railroad terminals, filtration and sewage plants, hydro-electric developments, highways, bridges and bridge piers, mine shafts and tunnels, river and harbor developments and complete industrial projects.

As its name would indicate, THE FOUNDATION COMPANY also specializes in underpinning and foundations. Most of the skyscrapers in lower New York City rest on foundations built by this Company.

RAMP BUILDINGS CORPORATION

Consulting Garage Engineers

21 East 40th Street, NEW YORK, N. Y.

Product

D'HUMY MOTORAMPS, a patented System of Garage Design, involving a combination of ramps with staggered floor levels, the building being divided into two or more units.

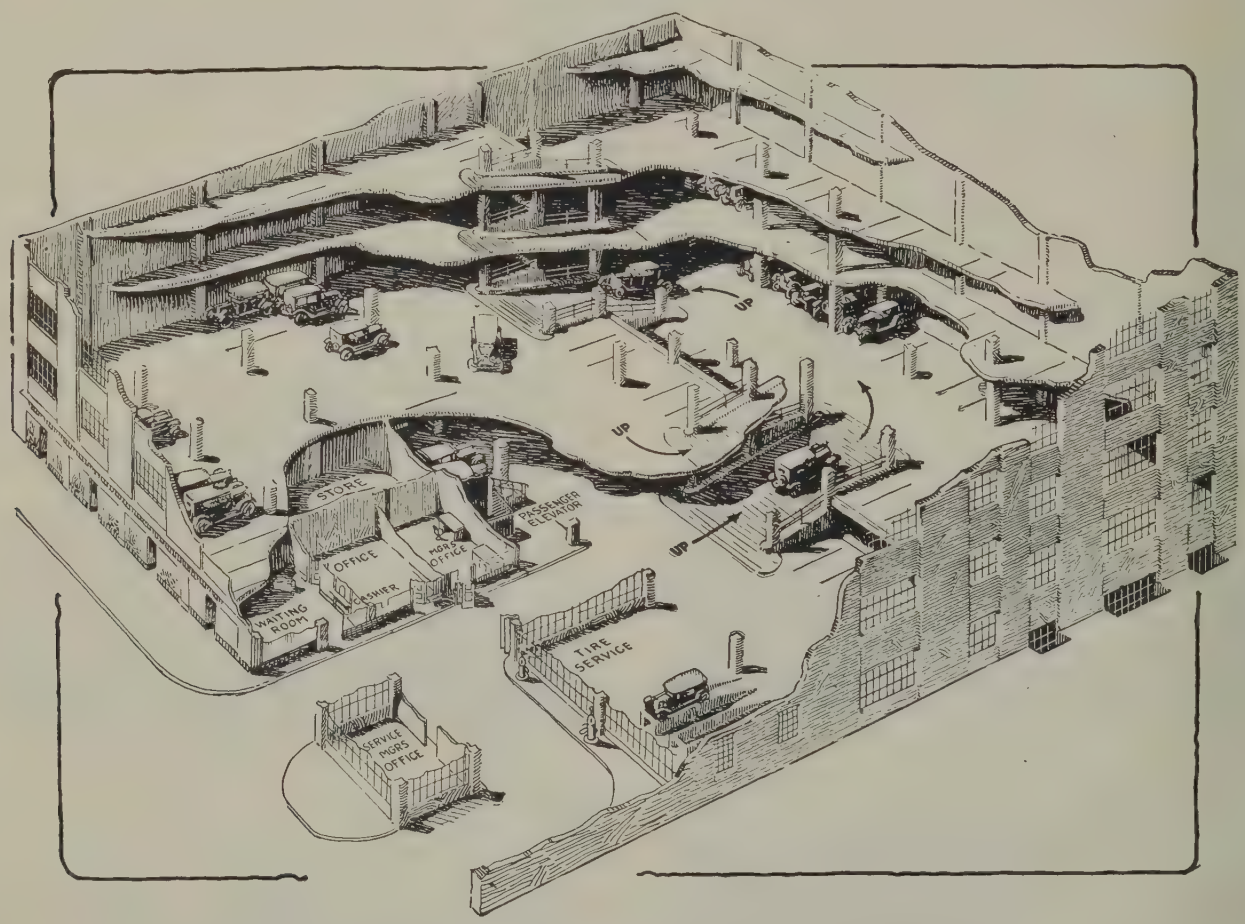
Building Design as It Affects the Commercial Success of a Multi-floor Garage

(1) Because garage revenue is directly proportioned to the number of cars stored, maximum car capacity for any given floor area is an absolute essential.

(2) Operating economy demands a building in which each car pays for its own vertical transportation—via ramps.

d'Humy Motoramps are adaptable for plots of any dimension greater than 50-ft. frontage and can be readily adapted to plots of irregular contour. The ramp location is as flexible as that of elevators. d'Humy Motoramps have been used in 2-story buildings and in garages as high as 10 stories—and higher buildings are contemplated.

Single roadway d'Humy Motoramps (with passing points at every floor-level aisle) are ordinarily used in garages up to 4 or 6 stories high where the storage floors house 50 to 60 cars each. Generally for larger garages, or where the peak traffic load makes greater ramp capacity desirable, double roadway motoramps are advisable. The latter arrangement provides separate paths for up and for down traffic. The type of Motoramp and the ramp arrangement should in all cases be chosen in consideration of the particular conditions which obtain. This company will be glad to discuss such matters, entirely without obligation.



Cut-away Perspective Drawing of a Typical d'Humy Motoramp Garage
(Single Ramp System—up and down traffic on same ramps)

(3) The building must be designed to give the patron a measure of convenience, safety and service which will attract and hold business.

d'Humy Motoramps

This patented system of building design is based on the staggering of floor levels in at least two portions of a building and connecting each half-story difference in floor level with short ramp inclines.

The division line between two of the units of the structure may extend across one dimension of the building or may be arranged in a rear corner so that the building will not show the staggered effect in its fenestration on either of two facades.

Advantages of d'Humy Motoramps

Storage efficiency in any building at least equal to elevators and 10% to 25% better than ordinary ramp floor layouts. Maximum possible income.

Traffic capacity beyond any elevator equipment, and in excess of oldstyle floor-to-floor ramps because of better visibility and minimum possible interference in short travel through storage aisles.

Continued on next page

A Typical Interior Showing the Short Ramp Length, Easy Grade and Complete Visibility

Simple construction, easy formwork and no structural complications.

Building convertible into two standard type structures.

Safety for patrons. Open side ramps afford complete visibility for the turn ahead.

Specifications

The term d'Humy Motoramp in these specifications shall be understood to describe the short ramp between floor levels in one portion of the building which are mid-way between the floor levels in another part—a special and patented type of building design known as the d'Humy Motoramp System and licensed for use in this structure by RAMP BUILDINGS CORPORATION, New York, N. Y.

Essential Design Data

Car Spaces—6 ft. 8 in. to 7 ft. in width, 12 to 15 ft. in depth.

Aisles—20-ft. width in the clear.

Car Bays—Three car bays are usually most efficient.

Columns—Outside face of column set back 1 ft. from line of car spaces.

Ramp Grade—From 13% to 15%.

Story Heights—10 ft. 6 in. to 11 ft., floor to floor. A minimum clear headroom of 8 ft. 6 in. should be maintained.

Note: For complete data ask us for Garage Design Data Sheets. The above data is necessarily approximate. Exact dimensions must be determined by local conditions and requirements. The specialized experience of this company's engineers is available to architects, as noted in a following paragraph. Consult us before your plans are laid out; we can save your time.

Ramp Buildings Corporation Services

Working with and through the architect in all matters, the company places its specialized knowledge at his disposal in furthering any project in which d'Humy Motoramps can be used.

Where desired, sketch plans (in miniature) will be prepared, without obligation, to demonstrate the relative superiority in storage efficiency of the d'Humy Motoramp design.

Complete consulting advice is available, without cost to the architect, on the establishment of critical dimensions, planning of entrance, service and control facilities, etc., upon the arrangement of a contract between the owner and RAMP BUILDINGS CORPORATION for the use of the d'Humy Motoramp System.

License Fees for Use of d'Humy Motoramp Design

The company licenses the use of its design patents after a standard scale of fees proportionate to the total floor area devoted to garage purposes. This fee is a charge made to the owner and is payable, if, when and as the building is erected.

References

d'Humy Motoramps have been specified as a profitable investment in the building of over 90 recent garages in 96 cities in three countries. Among these are:

THE IRVIN RAMP COMPANY

Engineers and Consultants for Modern Garage Construction

99 Vandergrift Building

PITTSBURGH, PA.

The "Irvin Ramp"

The "Irvin Ramp" is a patented system of garage building construction providing a continuous smooth driving surface—banked at all points—from basement to roof, resulting in the easiest and smoothest driving of automobiles and trucks in and out, up and down throughout the building, and also permitting the maximum storage.

It provides an easy, quick and safe method for storing 800 to 1000 cars in a single unit, and for building garages up to 10 stories in height. It is particularly adaptable for parking garages, service garages, truck garages, storage buildings and bus terminals.

The "Irvin Ramp" is an elliptical spiral runway, and the parking floors are eased off from the ramp so that the entire floor area is available for parking and aisles.

This solution to the garage construction problem is the result of building many garages, many years of thought, study and development by an experienced architect.

Consulting Architectural and Engineering Service

Our architectural and engineering service is available without obligation to architects and engineers having clients interested in this type of structure. We assist in making sketches embodying the principle of our patents and in evolving the very best possible structure and solving structural and plan problems. We place at the designer's call a vast experience in design, finance and operation.

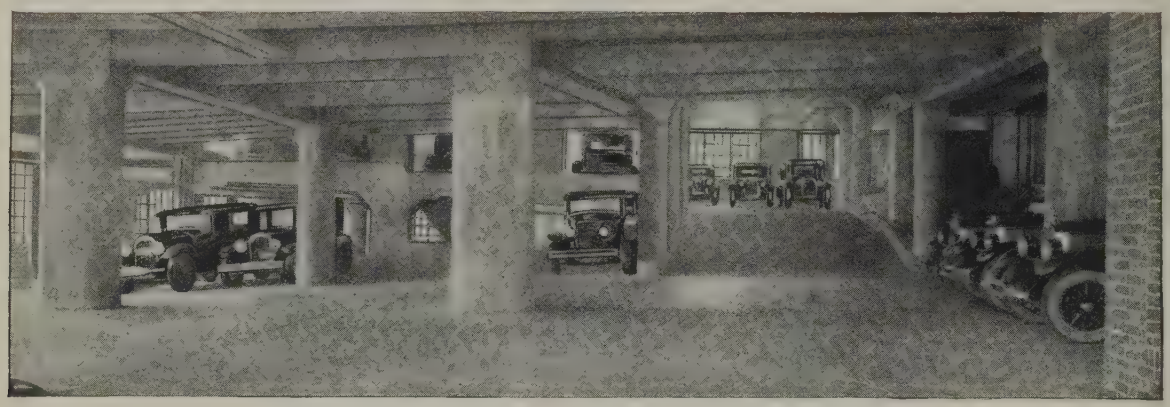
Our royalty fee is per square foot of floor area, from building line to building line, of any structure built upon this principle. This fee is paid on contract between the owner of the structure and ourselves.

Three Typical "Irvin Ramp" Structures

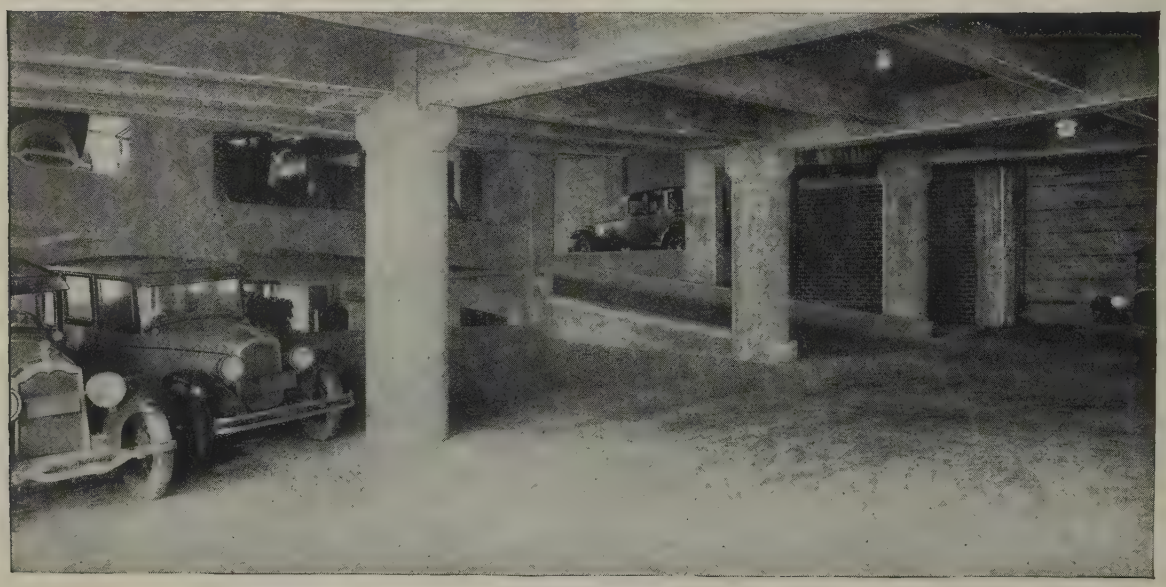
Fourth Avenue Garage, Pittsburgh, Pa.
For parking 450 cars and truck storage.

Monument Street Garage, Baltimore, Md.
Capacity—300 trucks; operated by the Consolidated Gas, Electric Light and Power Co. of Baltimore.

Service and Sales Garage, Washington, D. C.
For the Semmes Motor Company, Dodge Distributors.



Main Entrance, Fourth Avenue Garage, Pittsburgh, Pa.



Note Easy Turns and Low Grades on This Third Floor Ramp

THE BELL TELEPHONE SYSTEM

AMERICAN TELEPHONE AND TELEGRAPH COMPANY AND ASSOCIATED COMPANIES

A Service for Architects, Builders, Engineers and Owners

Comfort and convenience are basic requirements of modern telephone service. Their complete realization in large buildings or in residences involves the planning of suitable facilities for telephones in advance of construction.

To help in the attainment of adequate telephone comfort and convenience our telephone engineers have prepared two illustrated booklets, mentioned below, which will be furnished gladly to those interested in building projects.

Write or call the nearest Bell Telephone business office.

Residential Telephone Installations

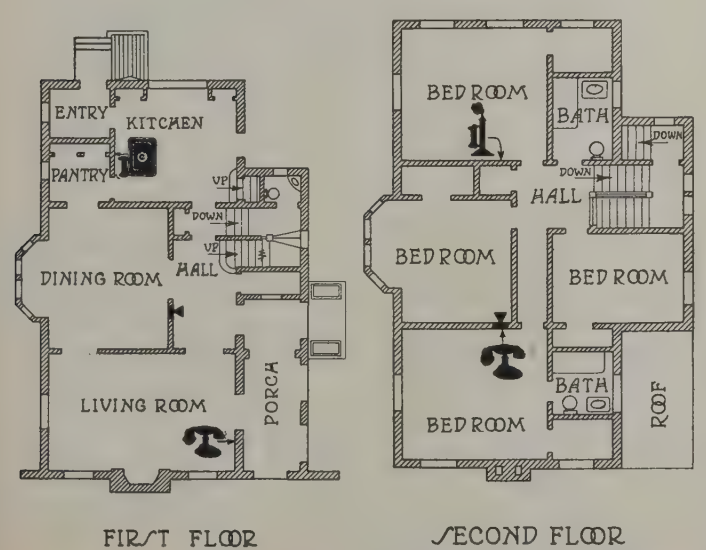
The growing appreciation on the part of telephone subscribers of the comforts and conveniences to be obtained from adequate telephone service requires the provision of more complete home telephone equipment. The placing of adequate facilities for the telephone wires and apparatus during construction results in general improvement of residences, in that better appearance is secured by concealing the wires and some of the equipment. Also the provision of these facilities provides flexibility in the arrangement of the telephone equipment. One of the illustrated booklets, "Planning for Home Telephone Conveniences," presents information which will be helpful to those engaged in the design and construction of residences.

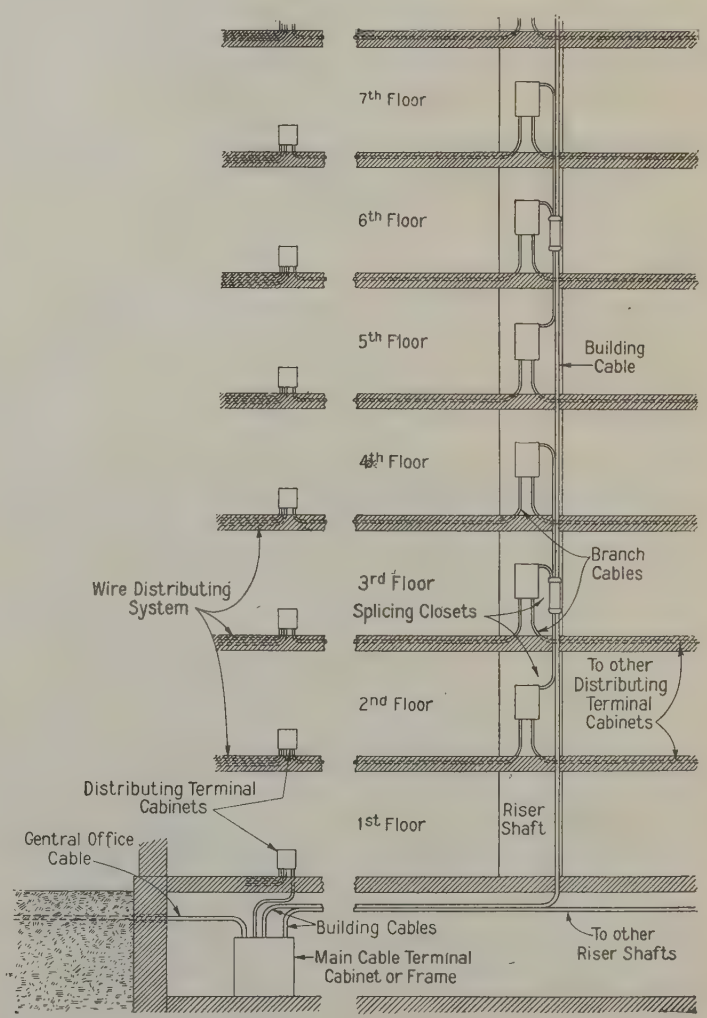
Large Building Telephone Installations

The modern large building contains a great many telephones which require for their operation numerous cables, terminals, wires and, in some cases, large switchboards with associated equipment. Facilities adequate for housing all of this telephone equipment are, like the facilities for water, electric light and power, essential features in the design of such buildings. The other illustrated booklet, "Planning for Telephones in Buildings," presents information which will be helpful to those engaged in the design, construction or alteration of office, loft, public buildings, hotels, apartment houses and hospitals.

Service

The services of the Associated Companies' engineers for consultation and advice on all matters pertaining to telephone facilities are also available without charge. A conference with telephone engineers can easily be arranged by a telephone call to any Bell Telephone business office.





Typical Plans Shown and Described in the Booklets Mentioned Above

GAS SERVICE AND EQUIPMENT

Recommended by Architects' and Builders' Service Committee

AMERICAN GAS ASSOCIATION
420 Lexington Avenue
NEW YORK, N. Y.

Gas in the Service of the Home

Due to recent development in the manufacture of gas appliances, gas has entered into a new era of usefulness in the home. Gas is now the most modern agent for cooking and refrigerating food, incineration of household waste, providing hot water for household cleanliness and for personal toilet, insuring comfortable house temperature at all seasons of the year, and for permitting clothes to be washed, dried and ironed in the home under conditions of known cleanliness. These services make gas the world's greatest caterer to the fundamental needs of the home.

Original Installation

The increasing uses of gas make it more necessary than ever for the builder to provide the comforts and conveniences of modern gas service for the home owner at the lowest cost, by installing the proper piping and flues at the time the house is erected, which will permit the use of the various appliances thereafter.

Cost of Piping

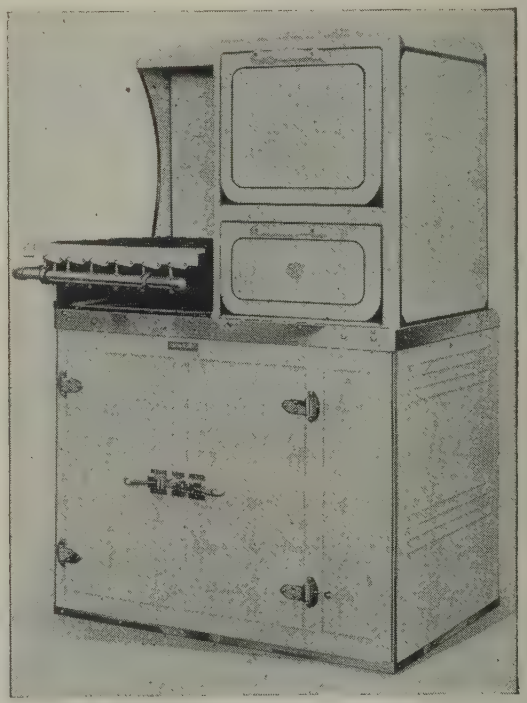
The cost of gas piping and flues, *if put in at the time of erection,* is relatively small when compared to the total cost of the building and compared to the increased rental value of the premises so equipped. This cost varies from 0.10 to 1.0% of the total cost of the building, the latter figure covering the most elaborate piping lay-out required to cover every possible contingency.

Selection of Appliances

No gas appliances should be installed which are not susceptible of such adjustment as will enable the user to bring about the complete combustion of the gas supplied under all reasonable service conditions. Because it is somewhat difficult for those not experienced in the utilization of gas to judge whether or not a given appliance is designed to comply with this requirement the AMERICAN GAS ASSOCIATION operates an elaborate Testing Laboratory, which tests all types of gas appliances. The Laboratory Approval Seal shown below is a guarantee of compliance with basic national standards of safety, established by experts from the AMERICAN GAS ASSOCIATION, U. S. Bureau of Mines, U. S. Bureau of Standards, U. S. Public Health Service, Heating and Piping Contractors National Association and the Master Plumbers Association, which every appliance should meet. Architects and builders are urged to specify and install only appliances which have been tested and approved by the American Gas Association Appliance Testing Laboratory. A list of the trade names and model numbers, as well as the names of the manufacturers of approved appliances, may be secured gratis from your local gas company, or from the AMERICAN GAS ASSOCIATION, 420 Lexington Avenue, New York, N. Y.

Kitchen Range

The range is the most important piece of kitchen equipment. It is the most used housekeeping device. The modern gas range with oven heat control has changed cooking from drudgery to a real pleasure. No modern home is complete without one of these new heat controlled ranges, which eliminate guesswork in cooking and permit the housewife to go about her other duties, secure in the knowledge that the food will be cooked to a turn. New color finishes for gas ranges can be had to match any kitchen color scheme.



A Special Type Combination Gas Refrigerator and Range
Particularly appropriate for apartment kitchens. Many other types of ranges and refrigerators are available as separate units

The following are the essential qualities of a range which will give real satisfaction to the home owner:

(1) *Convenience:* as to size, arrangement of parts, ease of control, and simplicity in cleaning.

(2) *Efficiency:* in the use of fuel without waste.

(3) *Safety:* correct construction to avoid hazards, such as incomplete combustion.

(4) *Attractiveness:* an important point in the opinion of the user.

(5) The Laboratory Approval Seal of the AMERICAN GAS ASSOCIATION, which is a guarantee of compliance with basic national standards of safety.

Continued on next page

The Gas Refrigerator

Scientific research has now produced a gas refrigerator with no belts, moving parts or other machinery to produce noise, wear and tear or trouble.

This means unbelievably silent operation, assuring freedom from monotonous and objectionable noises—superior refrigeration with low operating costs which compare favorably even with old-fashioned methods.

Be sure to specify this new marvel of science.

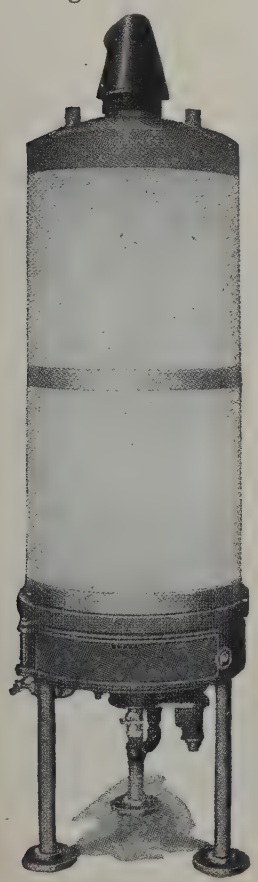
Hot Water Service

A plentiful and ever-ready supply of hot water is a most vital and sanitary need of any household and is essential to the comfort and cleanliness of the home and the family. Gas-fired water heaters of high efficiency and reliability are available in two main types.

One of these is the automatic instantaneous water heater which is suitable for water supply under a pressure of 10 lbs. or more at the highest faucet. On this type of heater the gas burners operate only while the water flows from the faucet (the burner being ignited by a pilot light and controlled by a valve operated by the water pressure). These heaters are both economical and efficient, but because of their large temporary demand of gas, require a larger supply pipe and meter.

The other type of water heater is the automatic storage heater which consists of an insulated water tank, a pilot light, thermostat and gas burner, so connected that the tank is always kept full of hot water ready for use. This type can be used on low pressure water supply and requires only a ¾-in. gas pipe and meter of corresponding size.

Where an installation is required at minimum cost, a non-automatic hot water service can be secured through the use of the circulating or tank type of gas water heater, manually controlled. Accessories can be had for this type of heater, whereby the gas can be automatically turned off after a given time. It is also possible to convert this type of heater to the automatic type later if desired.



Left:

Automatic Storage Type Water Heater

In this type water is always hot ready for use. Equipped with down-draft diverter and installed with a flue connection

Location of Water Heater—Water heaters should not be installed in bathrooms or other closely confined spaces, and the length of the hot water lines should not be excessive.

All automatic water heaters should be provided with flue connections.

Auxiliary Room Heating

Individual gas room heaters provide a welcome service during many days of Fall and Spring in removing chill and dampness from the room without necessitating the operation of the main furnace, which is not designed for efficiency when operated at low temperature and for short periods.

Room heaters are available in several types as follows:

(1) The radiant heater, often called a fireplace heater. Also coal basket type heaters.

(2) Individual gas-fired radiators, steam or hot air type.

(3) Portable heaters, not radiant type but flame type.

(4) Wall heaters, flame type.

For general attractiveness the radiant heater is a superior form of room heating equipment, particularly when installed as fireplace unit.

Portable heaters are available in many styles and sizes, including even a small radiant type. They are lower in cost than other auxiliary heaters and are frequently connected by means of flexible tubing, although this is not a recommended practice.

Gas outlets provided in several rooms will facilitate off-season comfort when the furnace is shut down.

Where flexible hose connections are necessary, a safe installation can be made by providing the gas outlet nipple, heater inlet nipple and the flexible tubing utilized is of the type that has been tested and approved by the American Gas Association Testing Laboratory. The shut-off cock for portable heaters should be located in the gas pipe outlet and not on the appliance. Safety hose cocks installed on all gas pipe outlets will prevent accidental opening of gas cocks.

Right:

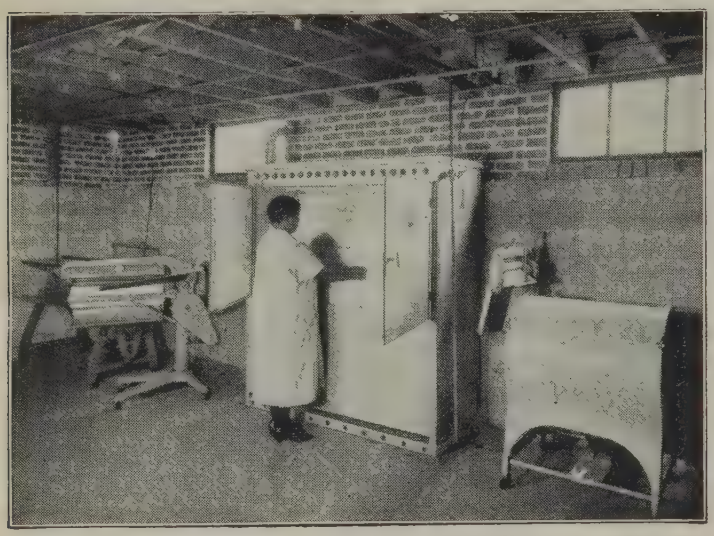
Radiant Fireplace Installation

Adds beauty and charm to any room. More efficient, cleaner and safer than a wood fire, and as attractive

Continued on next page

Laundry Equipment

Weather statistics show that less than one-half of the days of the year are suitable for drying clothes outdoors. The modern housewife appreciates nothing more than a laundry dryer, which permits her to dry the laundry quicker and better in her own basement, independent of the vagaries of the weather. Gas-heated dryers produce the same freshness, whiteness and freedom from mildew as outdoor drying and eliminate the labor of carrying the laundry in and out of the house.



Ironer, Dryer and Washer Installation

With these gas-heated appliances, washday ceases to be a burden and ignores weather conditions

Several makes of electric washing machines are equipped with gas burners to raise the temperature of the wash water economically and quickly. Where the washing machine is not so equipped, it is advisable to install a laundry stove for boiling the wash or reheating water for the washing machine.

Ironing machines, utilizing gas for heating the rolls, operate more economically than those employing other heating methods. The home laundry provided with complete gas-heated laundry equipment carries the assurance that clothes, linens, blankets, and all household laundry can be washed, dried and ironed under sanitary home conditions with less effort than ever before possible.

Heating the Whole House by Gas

The house equipped with a gas furnace gives positive assurance the home will always be kept warm and comfortable at a uniform temperature automatically, without any of the customary labor and attention. Gas furnaces are manufactured to meet all heating requirements—that is, for steam heat, vapor heat, hot water heat, or warm air systems. Each of these types has its special advantages and, as with solid fuels, the hot water heating system is slightly more efficient, sometimes running as high as 90%.

Amount of Gas Required for House Heating—The uniformity of the heating value of gas as a fuel makes it possible to predict with great accuracy the amount required to heat a home of any given size; once the climatic conditions in the particular section of the country are taken into account. The local gas company has a complete file of this information, and with data on the size of the house, construction of the walls and roof can easily provide an accurate estimate of the cost of house heating by gas.

Insulation Cuts Fuel Costs

The wall and roof heat losses can be cut to one-third of their normal value by the use of insulation with corresponding reduction in the amount of radiation and furnace size, as well as the operating expenses of heating the house. Oftentimes the savings in installation and cost of operation cover the added cost of insulating the house and make it possible to utilize gas for heating the home at little or no extra cost over solid fuel.

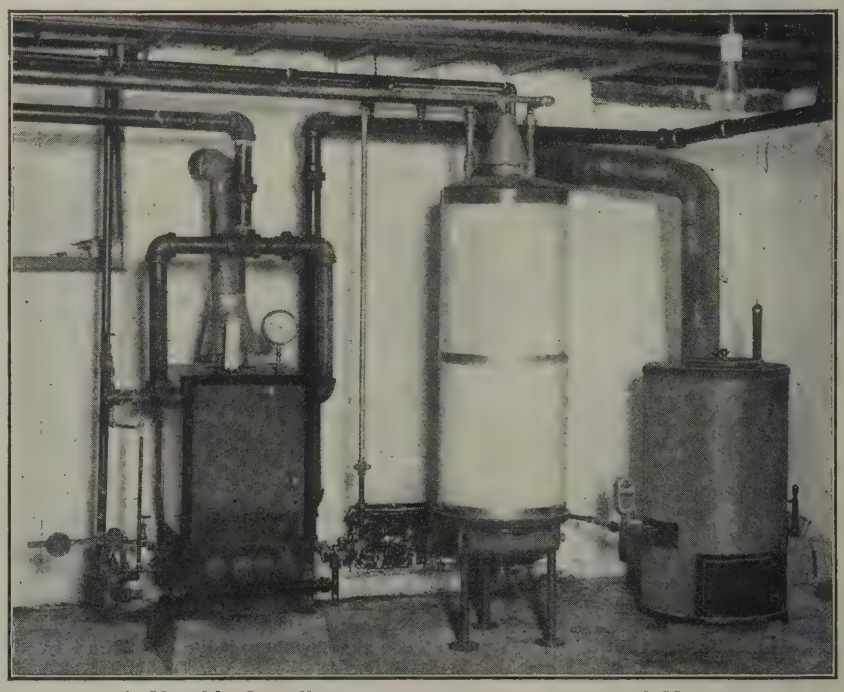
All gas-fired heating systems should be thermostatically controlled, inasmuch as the saving in fuel under these conditions and the uniform temperature made possible, more than pay for the added cost of the heat controlled equipment.

The development of automatic heating with gas as a fuel, for the first time recovers the space ordinarily required for coal bins and ash bins, and makes it available as a clean and useful part of the house.

Incineration

The gas-fired incinerator makes possible the complete disposal of household garbage, safeguards health, and saves labor and eliminates the unpleasant odors and opportunity for the spread of disease resulting from accumulation of garbage between collections by the municipality. In addition to this, the use of the incinerator avoids the fire hazard caused by the accumulation of old boxes, paper, etc., about the house.

The installation of an incinerator requires a flue, and therefore this appliance should be located as near to the chimney as possible. Oftentimes it is possible to install a chute from the kitchen, which will save all the labor of carrying the refuse downstairs to the incinerator.



A Notable Installation in a Six-room Insulated House

The heating system is hot water, using the small boiler at the left (which type is also used for water heating in other instances). Here the hot water supply is taken from the automatic storage heater (center); and the incinerator (right) disposes of all garbage and waste. This basement is used as a playroom, workshop and living room

Continued on next page

Installation of Appliances

No less important than the quality of the appliance itself is the provision of adequate supply piping, in order to insure the safe and satisfactory performance of gas appliances. Piping of the proper size insures constant and sufficient gas pressure and results in uniform operation of the burners, giving complete combustion and insuring reliable performance.

The following table gives the gas consumption of various domestic appliances and indicates the size of outlet ordinarily necessary for each appliance:

Appliances	Size of outlet ordinarily necessary, in.	Usual maximum gas consumption per hour, cu. ft.*
For the Kitchen:		
Gas range	¾	110
Gas refrigerator	¾	2 for continuous type 30 for intermittent type
For the Basement:		
Gas water heaters:		
Manual	¾	40 to 80
Instantaneous	1¼ to 1½	60 per gallon rating
Automatic storage	¾ to 1	60 to 80
Gas incinerators	¾	40 to 60
Gas boilers	1½ to 2½	300 to 1600 About 85 per hour per 100 sq. ft. installed cast iron steam radiation
Gas warm air furnaces	1½ to 2½	250 to 1000 About 35 per hour per 10,000 B.t.u. hourly heat loss from the building
For the Laundry:		
Gas heated laundry dryer	¾	60
Gas laundry stove	¾	30
Gas ironing machines	¾	20
Gas washing machines	¾	20
For Space Heating:		
Gas radiant heaters (for fireplaces)	¾	30 (or 3 per radiant)
Gas room heaters (flame type)	¾	15 to 30
Gas radiators (warm air)	¾	15 to 30
Gas radiators (steam)	¾	3 per section
Gas floor furnaces	¾ to 1	100
Gas garage heaters	1	50
Gas ignitors for fireplaces	¾	5
Gas wall heaters	¾	15

**Note:* For natural gas installation these figures should be divided by two.

General Principles of Installation

As local conditions govern to a great extent the practice and installation of gas piping it is urged that before the contract is let for this important part of your building, your local gas company be consulted. The following general conditions, however, apply in practically every community throughout the country.

Appliances shall be installed so that their continued operation will not in any way create a fire hazard because of adjacent flammable material. Vent pipes should not be run closer than 6 in. to unprotected ceilings and wooden joists.

Any appliance which consumes large quantities of gas, or which is automatically controlled and which depends upon a pilot light for ignition, shall be connected to an adequate flue or flue pipe.

This rule is particularly significant with regard to the very large appliances such as central heating systems. These burn such large quantities of gas that every precaution should be taken. As further protection, it is advisable to insist on thermostatic or other forms of safety pilot which shall cut off the main gas supply in event that the pilot is extinguished.

No water heating appliance shall be installed in a closed system of water piping unless a water relief valve is provided.

The presence of a water meter will serve to make it a closed system, as water meters permit the flow in only one direction. It is to be recommended, then, that all water heating systems be operated with a pressure relief valve at some point.

Proper Piping for Domestic Gas Service

Four factors determine the size of pipe needed; length of pipe, maximum gas consumption to be provided for, the allowable loss in pressure from the meter to the appliance and the specific gravity of the gas.

Your gas company will be glad to furnish the proper pipe sizes to insure good service to your installation of gas appliances, upon request and without charge.

Miscellaneous Recommendations

Piping should not be laid under tile, parquet or mosaic floors, where it is possible to avoid it. Piping should not be run along the bottom of beams that are to be covered with lath and plaster, but should be run along the top of beams or joists, where it is possible, so that it will be accessible by raising the floor boards, which, when covering such piping, should be fastened with brass screws.

All parts of piping should be securely and permanently fastened to or supported from the building itself. If this is not done, sags or undue strains may later develop and the piping may leak or condensation may accumulate in the low points of the sags and interfere with the free flow of gas.

All piping should be graded toward the meter or outlet—condensation can then be removed if necessary. Meters should be set in a clean, dry, safe place, not subject to wide variations in temperature.

Your gas company has complete information on the size, price and instruction for installing all of the equipment mentioned herein, and will be glad to supply this information upon request without obligation or cost to you.

The annual research bulletins of the Producers' Council on building materials and appliances, indexed in accordance with the standardized filing system of the American Institute of Architects, contain valuable data on the proper selection and installation of all types of gas appliances.

In addition, the Architects' and Builders' Service Committee of the American Gas Association will be glad to furnish specific answers to any questions relating to the design, construction and installation of gas service in the home. This data will be furnished without charge.

Of necessity, the appliances shown here are of particular makes. However, the showing of a particular manufacturer's product here expresses no preference of the A.G.A. for that particular brand.

BOSTON ACOUSTICAL ENGINEERING COMPANY

Manufacturers of Acoustex, an Ideal Sound Absorbing Material

46 Cornhill

BOSTON, MASS.

ACOUSTEX

Products

MATERIALS for ACOUSTICAL CORRECTION and SOUND INSULATION.

ACOUSTEX—a sound absorbing slab for acoustical correction.

For Trimount Sound Proof Doors and Folding Partitions, see page B1437.

Acoustical Treatments for Modern Buildings

The diminution of noise is taking an increasingly prominent place in the design of modern buildings. Banks, offices, schools, churches, hospitals, courtrooms, etc., are all benefited by quiet conditions.

The large areas of hard non-sound absorbing materials used in the construction of present day buildings make it necessary that a highly sound absorbing material be introduced to compensate for the use of hard sound reflecting materials. Acoustex, the result of many years of research and experimentation, is such a material; besides being a practical, efficient and scientifically correct sound absorbent, it has a beautiful and interesting but unobtrusive texture.

Properties That Make Acoustex an Ideal Sound Absorbing Material

Acoustex is fire resisting and is not affected by extremes of temperature.

Absorption—Tests made by Clifford Melville Swan in the Jefferson Physical Laboratory at Harvard University, and by Professor W. R. Barss at the Massachusetts Institute of Technology, show Acoustex to be a highly efficient sound absorbing material.

Decoration—Acoustex can be sized, and spray painted with a light cream color oil paint, or with any other color desired.

It may be vacuum cleaned and redecorated by spray-painting the surface. This can be done a number of times without causing the pores to fill with paint, or without greatly impairing its acoustic efficiency.

Sizes—Acoustex is furnished in slab or tile form, 12x12, 12x24, 24x60 in. Special sizes cut to order. Standard thickness 1 in.

Joints—Regular type Acoustex is furnished with rough sawn square edges, which, when laid together, produce close fitting joints so desirable for ceiling treatment. It may also be furnished with beveled edges when required.

Acoustical Treatment

The subject of sound as it is related to building interiors was reduced to an exact and practical science through the researches of the late Wallace Clement Sabine of Harvard University. Retaining Professor Sabine as consultant, JOHNS-MANVILLE CORPORATION established, in 1911, a Department of Architectural Acoustics, to provide a means for the practical application of his work to new and existing buildings.

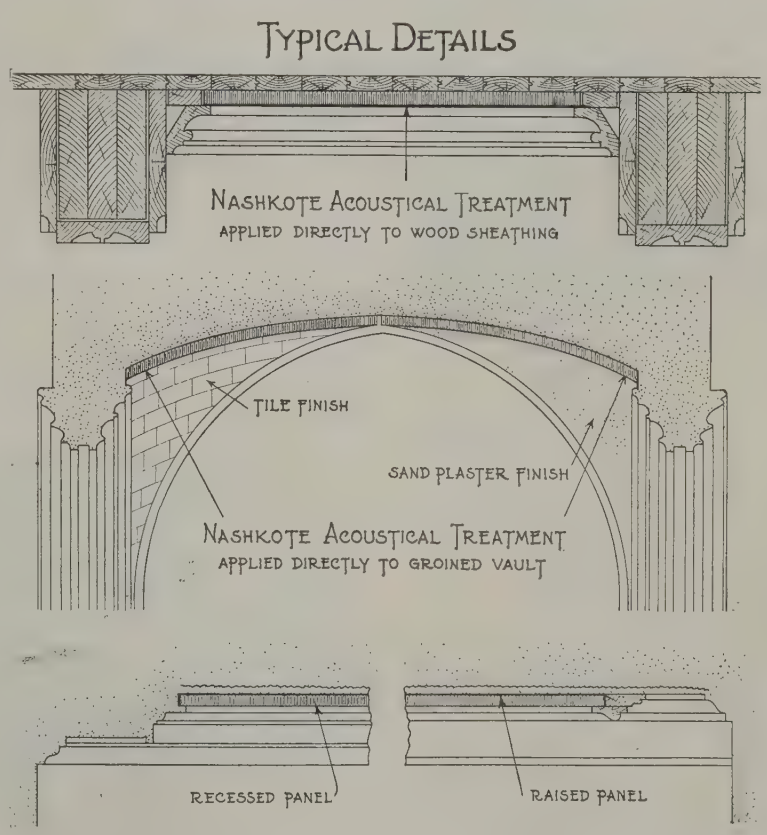
Literally thousands of acoustical problems of every conceivable nature have been successfully and practically solved during the past 17 years. A formidable background of knowledge and practical achievement has been built up, and the soundness of Professor Sabine's theories—the completeness with which they meet the combined requirements of public opinion and exacting taste—has been definitely established.

Consulting and Contracting Services—JOHNS-MANVILLE CORPORATION offers to architects a free consulting service for acoustical problems in building in advance of construction, and to correct the acoustic properties of existing buildings.

Contract departments are maintained in all large cities for the installation of acoustical materials when corrective measures are found necessary. Our construction work is done by competent men, skilled in the application of acoustical interior finishes, and the work is performed under our own supervision. Thus the entire responsibility of recommendations and their fulfillment rests in competent hands.

Materials—The principal acoustical product of JOHNS-MANVILLE CORPORATION is known as Asbestos Akoustikos Sound Absorbing Felt, which possesses to a unique degree the qualities which absorb sound—porosity of the mass and the flexibility of the mass as a whole. Akoustikos Felt is as practical an interior finish as any of the materials it covers or replaces. It is fire resistant, and in its manufacturing process is treated in a manner to make it, in effect, a germicide. It possesses great tensile strength. It may be cemented, with a waterproof and heat resisting cement, to any kind of a foundation or any character of warped or groined surfaces, and finished in a tremendous number of texture and decorative effects.

The Johns-Manville Nashkote type of acoustical finish, using Akoustikos Felt, is capable of manipulation in thickness, density and finish, so that practically any reasonable percentage of sound absorption may be obtained in any part of the musical scale. The surface may be finished to give the effect of a smooth or sand finished plaster, burlap or brocades; or it may be decorated to an unlimited degree and with as much permanence of color as any plaster or wood surface. Special finishes are available to provide maximum sound absorbing efficiency in quieting business offices, restaurants, banks, hospitals, etc.



NASHKOTE ACOUSTICAL TREATMENT

Specifications

The amount and location of sound absorbing finishes to assure proper acoustical properties for any room are so intimately and individually linked with the design and interior finish of the room in question, that it is not practical to write a specification for the work which will be applicable in all cases. Competent acoustical engineers are available in all branches of the Company for consultation without fee or obligation.

The Company

The C. F. BURGESS LABORATORIES, INC., have long been known for their reliable, impartial and scientific handling of technical problems. The organization is built up of efficient, technically trained engineers for the study and development of scientific methods relating to physics and chemistry.

An important branch of its business relates to acoustics, the manufacture and installation of acoustic materials and in addition, the furnishing of independent engineering service in the study of acoustic problems.

An Involved Acoustical Problem

Experience

The excellent acoustic properties in many theaters, university and high school auditoriums, churches and lodge buildings are the results of special study by Burgess engineers. Years of acoustical research in the laboratories have resulted in special equipment for making acoustical analysis to assist in these studies.

Consulting Acoustical Engineers

Architects as well as the general public appreciate the necessity for good acoustical conditions wherever people gather together in groups for worship, education, business or entertainment.

Structural requirements for a building must be studied and specified by technically trained engineers. Acoustical requirements must likewise be handled by those skilled in the art. The Burgess Laboratories offers an impartial service to architects. In analyzing an auditorium many problems may be encountered. The two most important factors to be controlled are the period of reverberation and the effect of echo-producing surfaces.

Special Equipment

Special methods and equipment have been worked out to make the study of acoustics scientific and accurate. The Burgess photo-echo method of analysis definitely and quickly locates sources of sound focii, and Burgess specifications will define any and all changes necessary to obviate difficulties found.

The Burgess Acoustimeter accurately registers the sound level or intensity of sound built up in a room due to noises transmitted through walls, floors and windows or produced by sources in the room.

Reports from Plans in Advance of Construction

Sketches or blue prints of proposed buildings showing details of construction and the materials to be used, sent to the Engineering Department, will enable us to report fully on conditions which will prevail in the finished structure, and to recommend any corrective measures which may be necessary. The same method is used for existing buildings.

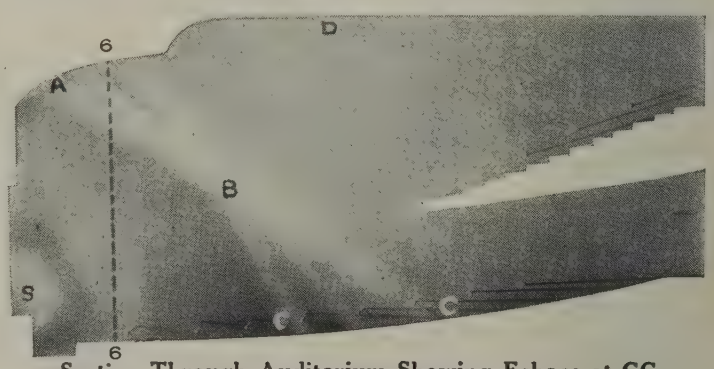
Services and Charges

Sketches or blue prints of proposed or existing buildings will receive prompt attention and will be returned quickly with a report or recommendations. This method of analysis permits the submission of guaranteed specifications.

These engineering analyses are impartial and on a fee basis, the fee charge depending upon the cubical contents of the portions of the structure studied. By submitting plans or sketches of proposed or existing buildings an estimate can be made on the charges for a complete acoustical survey.

Example of Analysis

The engineering analysis covers all types of problems found in the control of sound in churches, school auditoriums, hospitals, banks, hotels, restaurants and general offices. The Laboratories are, furthermore, prepared with instruments to report on the sound transmission through partitions, floors, ventilating ducts, etc.



Section Through Auditorium Showing Echoes at CC

The longitudinal section through an auditorium, as above shown, will give a fair idea of one method of photo-echo analysis.

"S" is a source of sound and "A" is a proscenium arch over the stage. It will be noted that sound waves reflecting from surface "A" focus at "B" and cause echo conditions at "CC," as is shown by the double shadows in that area. To correct such a condition, the proscenium arch "A" could be changed in its curvature so as to reflect into the balcony sound waves striking it, thus reinforcing the sound and eliminating the serious condition at "CC." If this curvature could not be changed because of architectural unity or because the building has been erected, then surface "A" would have to be covered with a sound absorptive material of high efficiency to absorb the distorting sound. In addition to the longitudinal sections, plan as well as transverse sections through the auditorium must be studied as is suggested by line 6-6.

In addition to the echo analysis, the period of reverberation must, of course, be determined for each is a distinct problem.

BURGESS ACOUSTICAL PRODUCTS

Integrity

The C. F. Burgess Laboratories, Inc., was founded in 1910 and has an established financial standing and reputation throughout the country. The Burgess name assures efficient and dependable products and its rating will bear out this statement. Performance bonds will be furnished wherever desired.

The Laboratories have successfully developed many well-known articles and products in the electrochemical, paper specialty and building fields. Their reputation as manufacturers of Burgess Batteries is unquestioned, and certain of their developments in the building field are well known. With their scientific background they realized the need of acoustic materials which would have characteristics not found in those then present on the market, and in their usual thorough manner have developed outstanding acoustical treatments.

Burgess Sanacoustic Tile (Metal)

Burgess Sanacoustic Tile consists of perforated metal forms, back of which is placed a highly sound absorbent material such as Mineral Wool, Balsam-Wool, Flaxlinum or Hairfelt. These forms in turn are locked definitely into light structural T-sections which have been bolted or screwed to wall or ceiling surfaces. When using Sanacoustic Tile, lath and plaster may be eliminated on many types of construction. This installation is highly fire resistant as well as permanent and has no upkeep expense. The surface of Sanacoustic Tile can be readily washed, or if redecoration should be desired after some years, it can be repainted with ordinary paint without harming its acoustic efficiency. Sanacoustic Tile is made in size 16x16 in. with either square turned or beveled edge. The surface is finished in baked enamel of standard color, thereby having high light reflective properties. Special color will be provided if desired.

Burgess Sanacoustic Tile offers the most real value for the money expended, and assures the architect of a high co-efficient of absorption, high light reflection, permanent construction, high fire resistant properties, redecoration as desired, sanitary construction and no upkeep expense.

The two following pages contain details of Burgess Sanacoustic Tile with specifications and descriptive features.

Burgess Sanacoustic Fabric

For certain special conditions Burgess Sanacoustic Fabric offers the architect an interesting and efficient acoustic treatment. This consists of blocks of hairfelt to which is secured with a moisture and heat resisting cement, Burgess 19-LF Membrane (resembling burlap), the whole in turn being cemented to the surfaces to be treated. This type of treatment was developed especially for double curved surfaces and can be decorated effectively to represent blocks of stone. Due to the varying thicknesses of punched hairfelt which may be used, this treatment also offers co-efficients of absorption commensurate with the work which it must do.

Burgess Membrane Treatments

The Burgess Laboratories are equipped to install panels or concealed edge membrane treatment where this method of installation is demanded. Burgess Acoustic Paint enables decorating such membranes effectively without decreasing appreciably the absorption of the treatment.

Burgess Board Installations

Where low co-efficients of absorption can produce satisfactorily the correct acoustical properties Burgess Board Installation can be made. This board is installed in sizes ranging from 12x18 in. with beveled edges to sheets 4x10 feet. The small blocks can be laid up in broken Ashlar design thus giving the effect of tile. This board is manufactured in a standard cream white color although special acoustical paints can be used for tinting if desired.

Installations

Burgess installations can be made in any part of the country by crews under Burgess superintendence, thus assuring swift and efficient workmanship. Stocks of Burgess acoustic materials on hand for immediate delivery.

Guarantee

The Burgess Laboratories will guarantee in specific terms that, if its recommendations are followed, the acoustic properties of the room or rooms analyzed will be correct for the uses to which these rooms will be put. The Burgess guarantee is back of all specifications written.

SANACOUSTIC TILE DISTINCTIVE FEATURES

1. High coefficient of sound absorption.
2. Low cost per unit of sound absorption.
3. Permanent baked enamel surface.
4. Redecorates-acoustical properties unchanged.
5. Sanitary surface easily cleaned.
6. Does not detract from architectural design.
7. High coefficient of light reflection.
8. No expensive upkeep involved.
9. Fireproof-with excellent heat insulation.
10. Exposed parts and fittings made of metal.
11. Easily and quickly installed.
12. Standard size-square turned or beveled edge.
13. Substitute for lath and plaster.
14. Finished in any colors desired.
15. Perforation unnoticeable at ordinary ceiling height.
16. Excellent background for stencil or mural designs.

SPECIFICATIONS

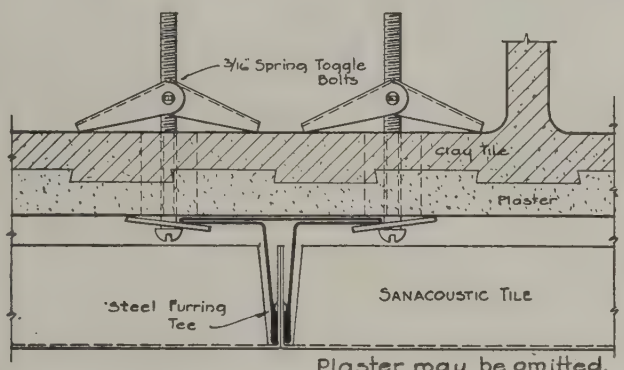
GENERAL SPECIFICATION

Where acoustical treatment is shown on the plans it shall consist of Burgess Sanacoustic Metal Tile backed by one inch (*). The tile shall be secured to the surfaces to be treated by means of Burgess Metal Tee Runners firmly secured to the (Metal Lath),(Hollow Tile),(Concrete) (Brick), ceilings or walls. The Sanacoustic Tile shall be furnished with standard post card cream baked enamel finish (or color to be selected by the architect). Where treatment terminates a suitable wood moulding shall be installed and given two coats of interior flat paint of an approved color.

SUBSTITUTE FOR LATH AND PLASTER

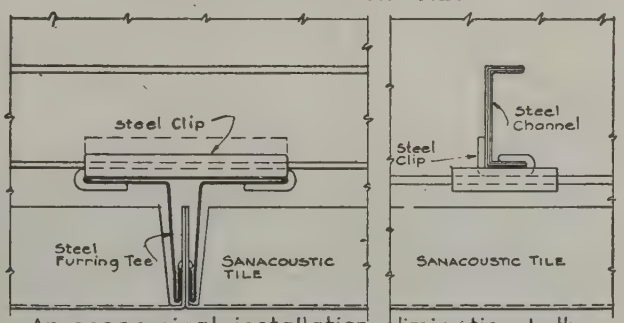
Where acoustical treatment is shown on plans all metal lath and plaster, furring channels, and carrying bars shall be omitted. This contractor shall install the necessary carrying bars to properly support the acoustical material. The treatment shall consist of Burgess Sanacoustic Metal Tile backed by one inch (*), The tile shall be secured to the surfaces to be treated by means of Burgess Sanacoustic Metal Tee Runners firmly secured to the carrying bars. Where treatment terminates a suitable wood moulding shall be installed and given two coats of interior flat paint of an approved color.

* 1. Mineral Wool
2 Balsam Wool
3. Flaxlinum
4. Hairfelt



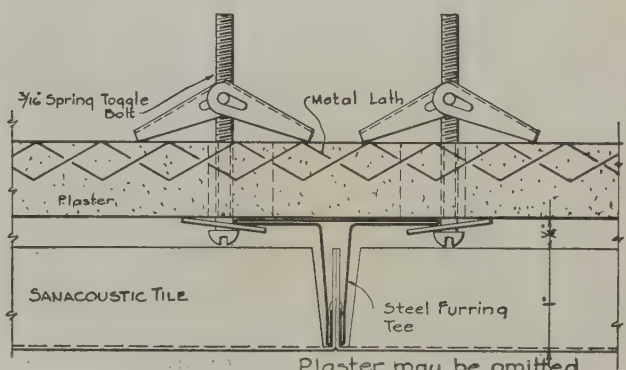
Plaster may be omitted.

INSTALLATION ON CLAY TILE



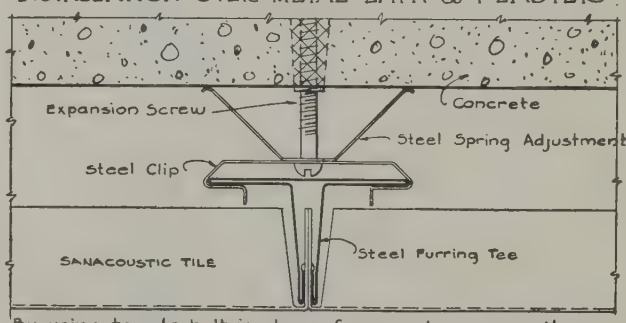
An economical installation eliminating both lath and plaster.

INSTALLATION ON STEEL CHANNELS-NO PLASTER



Plaster may be omitted

INSTALLATION OVER METAL LATH & PLASTER



By using toggle bolt in place of expansion screw, this furring clip may be used on constructions above.

R. GUASTAVINO COMPANY

INCORPORATED

Timbrel Arch Construction and Masonry Acoustical Installations

BOSTON, MASS.
40 COURT STREET

225 West 34th Street
NEW YORK, N. Y.

FACTORY
WOBURN, MASS.

Products and Services

The business of this company is that of DESIGNING and INSTALLING the SYSTEM of TIMBREL ARCH CONSTRUCTION, and the installation of fireproof acoustic material known as AKOUSTOLITH.

Also Rumford Ceramic Acoustic Tile.

Note: It is important to record that Professor Sabine and Mr. Guastavino were the first in the acoustical field to develop along correct technical lines and to bring to a point of commerciability, a masonry fireproof material having a sound absorbing or acoustical value many times greater than that of ordinary plaster, and, in view of that fact, the United States Patent Office has awarded to these inventors patents which are basic to a sound absorbing material of the character of our Akoustolith and which covers the use of that material in any form it may be prepared or used.

Co-operation

Owing to the varied uses of our construction, involving engineering and architectural features, the more satisfactory method is to send us, before the plans are fully drawn, a sketch outline of the requirements, which will enable us to indicate the most approved method of treatment and the approximate cost.

The service of our acoustical engineer is at the architect's disposal in order to determine the correct location and amounts of AKOUSTOLITH TILE or PLASTER.

Facilities

This company owns and operates for its sole use, as contractors, a factory for the manufacture of the better grades of glazed and unglazed tile and acoustic tile required as a soffit course in vaulted construction. It has, therefore, unexcelled facilities for prompt installation and the making of special pieces in connection with its contracting business.

Akoustolith Tile

Description—AKOUSTOLITH TILE is an all-masonry material having a sound absorbing or acoustical value higher than any other masonry material on the market. Its value has been demonstrated by laboratory tests made by the late Prof. Wallace C. Sabine, of Harvard University, and by many important installations.

Adaptability—Owing to its light weight (about 4 lb. per board foot) and facility of manufacture, AKOUSTOLITH is easily adapted to plain or elaborate architectural forms.

Texture—AKOUSTOLITH is made in a variety of textures, usually of a fine granular appearance, and can be made to closely resemble the usual building stone employed for interiors.

Permanency—The permanency of AKOUSTOLITH, owing to its composition of masonry, is assured. It will not disintegrate nor warp; moisture has no effect on its structure. It is genuine masonry, and noncombustible.

Color—AKOUSTOLITH is manufactured in a wide range of colors, ranging from gray white through various shades of buff, brown, or any colors resembling those of building stones.

Stock Sizes—AKOUSTOLITH is manufactured in any size from the smaller tile dimensions—4x8, 5x10, 6x12, 8x16 and 10x20 in., all about 1 in. thick—to the larger ashlar sizes for wall work.

How It Is Installed—AKOUSTOLITH used on ceilings has primarily been installed in connection with our regular Guastavino arch construction, using it as a soffit course of tile and backing up the same with two or more layers of rough tile. It is, however, being largely used by applying it directly on the soffit of the concrete floor slabs, or wire lath and cement plaster ceilings.

For inside walls the installation can be made directly on any of the many masonry surfaces without scratch coat, if surface is reasonably true. In this case the material can be purchased f.o.b. factory and set by either the general contractor or his tile layer.

Akoustolith Plaster

AKOUSTOLITH PLASTER is a light weight masonry material used as a finish coat ½ in. thick possessing a sound absorption of from .31 to .59 between the frequencies of 297 to 2890 vibrations per second—these values being many times greater than ordinary plaster.

Uses—AKOUSTOLITH PLASTER is used for the purpose of insuring correct acoustics in auditoriums and churches, also in hospitals, banks and offices, etc., where excessive reverberation would occur.

Color—AKOUSTOLITH PLASTER is a light gray color, almost white. If other colors are desired the usual mortar stains of any shade that the architect may select can be added by the plasterer. For tinting AKOUSTOLITH PLASTER after installation special instructions will be sent on request.

How Purchased—AKOUSTOLITH PLASTER is sold f.o.b. factory, packed in bags and ready for use with the addition of water only, and can be applied by any intelligent plasterer following the specifications and instructions furnished by the manufacturer.

MACOUSTIC ENGINEERING COMPANY, INC.

Acoustical Engineers and Manufacturers of Macoustic Material

Union Trust Building, CLEVELAND, OHIO

DISTRICT SALES ENGINEERS IN ALL PRINCIPAL CITIES

Organization

An organization devoting its energies *exclusively* to the problems of sound control.

Macoustic Material

Macoustic is a plastic material which *goes on like plaster.* Used in accordance with Macoustic engineering recommendations, based on definite established principles of sound direction and control, Macoustic controls sound reflection and provides a uniform degree of good hearing under all conditions. Macoustic is low in cost, as well as simple and inexpensive to apply. It is permanent and becomes an integral fireproof part of the structure.

MACOUSTIC
REG. U. S. PATENT OFFICE
Patents Pending

John Hancock Insurance Building
Every office quieted with Macoustic

cost as ordinary plaster. Coverage, 100 yd. per ton.

Permanence—Becomes an integral, permanent part of the interior.

Decorative Appearance—Unlimited range of surface texture finishes in combination with harmonious color. Macoustic may be marked off in any desired pattern.

Fire Resistance—Macoustic is fireproof and verminproof—not an added hazard.

Acoustical Effectiveness—Evidenced in actual practice by universally successful achievement.

Low Cost—The reasonable cost of Macoustic treatment places it within the reach of the smallest jobs, permitting a specification for Macoustic where otherwise this important consideration of good hearing would necessarily be eliminated.

Absorptive Value—Macoustic absorbs as much as 36% of the sound waves striking its surface, as determined by tests. This exceptional acoustical value is the direct result of properly coordinated triple acting mechanical-aero-chemical processes.

Engineering Service

To assure a desirable accoustical factor of safety and protect the clients' interest, an engineering service is rendered. From the architect's drawings, an analysis is made by competent engineers which determines whether treatment is necessary, and so, where Macoustic should be applied to obtain the best results, for the least cost and for decorative effects in harmony with the architect's design. *There is no charge whatever for this advisory service, nor any obligation.*

One of the Many Textures Possible with Macoustic

Additional Data

Write for the "Macoustic Data Book" which includes illustrations in color of textures and list of typical installations. For prompt analysis send drawings to us direct, or through our nearest representative. They will be returned with our acoustical engineering report with cost data covering each of your interiors.

Almost Unlimited Texture and Color Range

Specification

Use the following:

Macoustic, manufactured by the MACOUSTIC ENGINEERING COMPANY, INC., Union Trust Building, Cleveland, Ohio, to be applied on all surfaces specified and recommended by the Manufacturer's Engineering Department, and in accordance with their standard specifications.

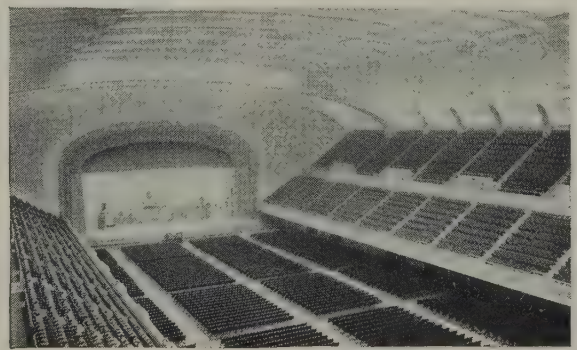
How Applied—Macoustic is mixed with clean water and applied in the same manner as ordinary plaster, over the usual brown coat, and laid on to a depth of ½ in. Produce specified surface texture finish.

Distinctive Macoustic Features

Practicability—Mixed and applied in exactly the same manner as ordinary plaster without special solutions or formulas or special skill.

Economy of Application—Applied for the same labor

National Broadcasting Company Building, New York
Studios in Washington and Chicago also treated with Macoustic



Macoustic Design—Macoustic Treatment
Cleveland Public Auditorium, seating capacity, 15,000. The largest and most successful acoustically designed and treated interior in the world

Interior of St. Louis Cathedral, St. Louis, Mo.

JAMES GAMBLE ROGERS, New York, N. Y., CHILDS & SMITH, Chicago, Ill., Associate Architects
Walls and ceiling of Sabinite

Advantages

Sound absorbing materials previous to the invention of Sabinite were in general fabrics or similar soft fibrous substances—inherently combustible, catch-alls for dirt, vermin, and pathogenic bacteria. Some have conspicuous patterns which do not always fit into the plans for decoration. Sabinite is a hard plastic material which combines ample sound absorption with a permanent finish plaster that will not burn, rot or mould. It is completely sanitary, cleanable and does not provide nesting material nor hiding places for vermin.

Sabinite walls do not cause comment. They look like other walls and may be painted or integrally tinted to unobtrusively fit into any scheme of decoration, or may be stenciled to form a major note in the beautification of any structure. They are applied by the plastering contractor under direct supervision of a service man furnished without cost by the manufacturer. The absorption of Sabinite is guaranteed by the manufacturer and is secured at usually lower costs per unit of absorption.

Description

Sabinite Acoustical Plaster is designed to combine definite absorption of sound with all of the properties of a finishing plaster. It is the invention of Dr. Paul E. Sabine, director of the most complete acoustical laboratory in the world—the Riverbank Laboratories at Geneva, Illinois.

Use

Sabinite Acoustical Plaster is applied to ceilings or sidewalls in lieu of the usual plaster finish. The area to be covered should be determined after a careful acoustical analysis of the room. It is applied in two successive coats each ¼ in. thick, with the regular plasterer's tools.

Purpose

Sabinite Acoustical Plaster is designed to correct the acoustics of auditoriums, churches, lodge halls, gymnasia, courtrooms, ballrooms, theaters, etc. It is also indicated as a quieting agent in hospitals, office buildings, hotels, and similar structures.

Why Sabinite Absorbs Sound

Sabinite Acoustical Plaster absorbs sound because of myriads of minute tortuous passages which proceed from the surface to the interior of the ½-in. coat. Sound is repeatedly reflected in these passages, losing its energy to heat and friction. The passages are inherent in the material. No skill or art unknown to the commonest plasterer is needed to obtain them.

Absorption

Tests of Sabinite Plaster at Riverbank Laboratories yield a sound absorption coefficient at C4 (512 vibrations) of 30%; at C6 (2048 vibrations, the pitch of office noises) 39% of the sound is absorbed.

Acoustical Analyses

The company maintains a competent corps of acoustical engineers for the convenience of architects. They will analyze any auditorium from the plans before construction, predict the acoustical results and determine proper areas of Sabinite where necessary for the correction of the reverberation time under full performance guarantees. This service is without charge or obligation.

Users of Sabinite

Sabinite Acoustical Plaster has been used on over 200 prominent structures without a single failure to meet all demands made on it. Among these buildings are structures designed by Graham, Anderson, Probst & White; James Gamble Rogers; Bertram Grosvenor Goodhue Associates; Schmidt, Garden & Erikson; U. S. Treasury Department, and many others of similar prominence.

Specification Data

Complete specification data is found in the book "Sabinite—Controlled Sound" obtainable from any representative or office of the company.

UNITED STATES GYPSUM COMPANY

U.S.G. System of Sound Insulation

300 West Adams Street, CHICAGO, ILL.

Product

U.S.G. System of Sound Insulation.

A supplemental construction adapted for use on new or existing buildings to eliminate objectionable sound travel from the room of its origin to other parts of the structure. Furnished and installed by the Contracting Division of the Company, on a guarantee basis.

Details of Construction

The U.S.G. System of Sound Insulation comprises the following constructions or treatments:

U.S.G. Sound Insulative Partition Furring—Adapted to any standard type of partition construction, but preferably to tile (either gypsum or clay). Applied usually to one face only of the partition before plastering. This sound insulative furring measures approximately 2 in. from the face of the partition to the outer face of the lath, which is included as an integral part of the furring. Our construction when installed is ready for plastering by the plastering contractor.

U.S.G. Sound Insulative Floor—Adapted to any standard type of floor construction. Applied to the rough masonry slab or to the rough wood flooring. This sound insulative floor measures approximately 3 in. from the rough floor slab to the top of wood sleepers (usually 2x2's 16 in. center to center) which the construction includes and provides. This height allows approximately 1¼ in. clearance under the sleepers for passage of conduits, etc., without cutting the sleepers. The construction when installed is left ready for the furnishing and placing of wood flooring by the carpenter contractor. Finish flooring may be used directly over the sleepers, but for the best type of work we recommend that both rough and finish flooring be used. If desired, the furnishing and placing of the rough flooring may be included as part of the sound insulation work.

Note: Provision in our construction can be readily made for special floor heights, sleeper sizes, concentrated loads, etc.

U.S.G. Sound Insulative Suspended Ceiling—Adapted to any standard type of construction. Hung with hangers of No. 7 wire (or of size to meet local building requirements) spaced 2 ft. on centers in one direction and 4 ft. in the other direction. For masonry ceiling slabs these hangers should be installed under the general contract, when the slab is being poured, by the proper trade. This sound insulative suspended ceiling requires a minimum space of 5 in. from the structural ceiling to the underside of the lath, which is included as an integral part of the ceiling. Our construction when installed is ready for plastering by the plastering contractor. Where beams occur, our construction may either furr around the beam, allowing a minimum of 2 in. on sides and bottom of beam for such furring, or the entire ceiling may come below the beams.

Note: For certain types of construction a sound insulative ceiling furring occupying approximately 2 in. of space, and similar in detail to our sound insulative partition furring, may be used. This construction is recommended only for ceilings where space will not permit a suspended ceiling.

Miscellaneous Treatments

In addition to the treatment of walls, floors and ceilings as outline above, the U.S.G. System includes machinery bases and treatment of mechanical equipment, ventilating systems, piping, etc. In most jobs the treatment of these items is essential for proper results.

Advantages of U.S.G. System

Sound is commonly defined as consisting of alternate compressions and rarefactions of the atmosphere. Sound, however, is carried as a vibratory force by the molecular structure of *any* medium.

Continued on next page

In general, the denser the materials the higher the rate of speed that sound is carried. In building construction most sounds are not of sufficient intensity to be transmitted by the molecular structure of the materials, except those of direct physical impact. For example, a steel column will not carry to any appreciable extent the sound forces generated in the atmosphere by a voice, but will carry the direct impact of a hammer blow through the entire structure. Sound, however, is transmitted to a greater extent in a building due to the fact that the structural partitions, floors and ceilings form diaphragms which are relatively easily vibrated by sound forces. This vibration of the structural units as diaphragms actually recreates the compressions and rarefactions of the atmosphere on their opposite sides, thus reproducing the sound.

The greater the weight (and rigidity) of the structure unit the less the sound will be transmitted, or rather reproduced, by its diaphragm action.

To provide effective sound insulation in building construction is therefore a problem (1) of providing the most effective means of preventing the sound forces in the atmosphere (sometimes called "air-borne" sound) from acting upon the easily vibrated diaphragm construction, and (2) of preventing direct contact sound forces from being carried by the materials of the structure. The entire problem in its simplest form is the prevention of the transmission of vibratory force. The U.S.G. System of Sound Insulation was developed after a number of years of study and research to meet this requirement with the greatest efficiency. This is accomplished by interposing a shock-absorbing construction between the interior finished surfaces and the structural items of the building. Such shock-absorbing construction is obtained by attaching the finishing surfaces of partitions, ceilings and floors, etc., to their component parts of the structure by properly designed resilient means supplemented by vibration dampening material.

The U.S.G. Resilient Slips and Hangers are carefully designed devices formed of a special grade of steel and provide the essential non-rigid contact with a definite and permanent resiliency. The U.S.G. Insulative Fill is a dry, fluffy, flocculent, specially processed, mineral material of extremely light weight. It will noted, therefore, that the distinctive advantages of the U.S.G. System are the use of materials that are fireproof, vermin-proof and permanent in their effect.

Uses

The U.S.G. System should be used where a high degree of sound insulation is needed.

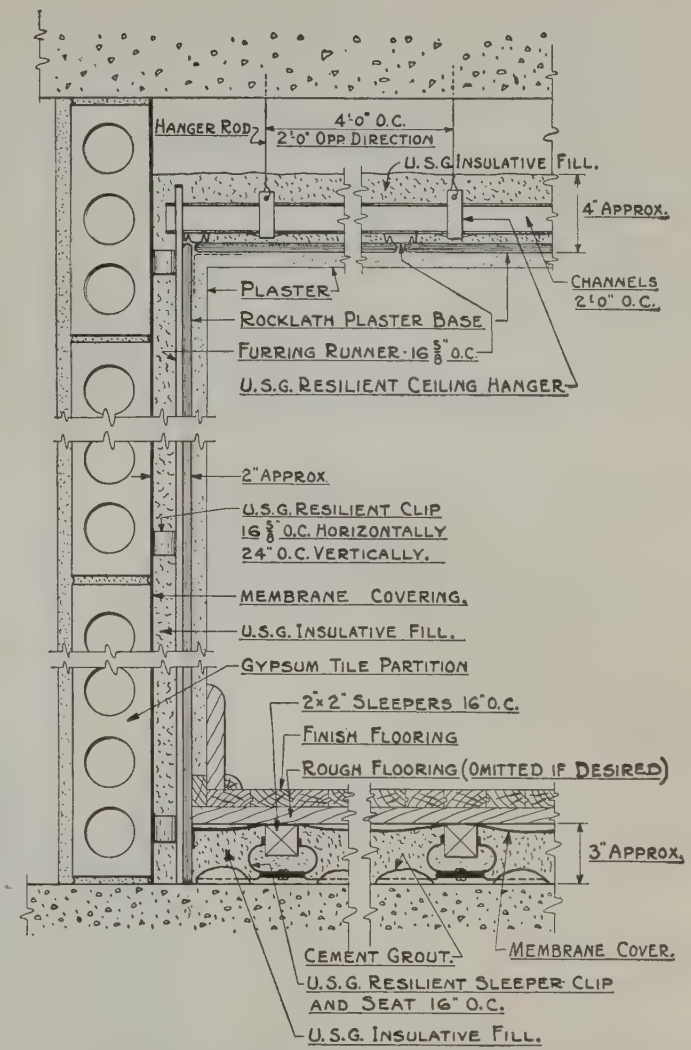
Apartments, hotels, hospitals, schools, club buildings, theaters and buildings housing bowling alleys and music studios, etc., all require effective sound insulation to a varying extent.

The U.S.G. Sound Insulation Floor provides a quiet resilient construction that is often used in dance halls, drill halls, gymnasia, etc., solely because of its non-reverberant and non-fatiguing qualities.

Engineering and Contracting Service

We offer a consulting service on problems of sound and vibration control and will give without charge or obligation detailed recommendations and cost estimates. When possible, this information should be obtained before plans and specifications are completed to allow proper incorporation.

The U.S.G. System of Sound Insulation is installed only by the Contracting Division of the United States Gypsum Company, which assures *definite results* and an *undivided responsibility*. Our work is not handled by agents.



Detail Section of U.S.G. Sound Insulative Floor, Wall and Suspended Ceiling Constructions

Guarantee

Our system installed in new buildings in accordance with our recommendations carries a written guarantee to eliminate objectionable sound travel.

Specification

Where sound insulation is indicated or specified, the U.S.G. System of Sound Insulation shall be used and shall be furnished and installed by the United States Gypsum Company, Contracting Division, 300 West Adams Street, Chicago, Ill.

Note: Detailed specifications furnished on request.

Acoustical Treatment

Sound insulation should not be confused with acoustical treatment. Acoustical treatment by use of exposed absorbent materials reduces reverberation *within a room,* by cutting down the reflection of the sound waves. It does not prevent to any appreciable degree the vibratory force of the sound from acting upon the walls, etc., and the sound being transmitted by diaphragm action as previously discussed. We also manufacture Sabinite Acoustical Plaster for acoustical correction and our recommendations therefore are unbiased on the proper use of sound insulation and acoustical treatment. For information on Sabinite, see page A23.

Engineering Service

We offer, in addition to a sound-proofing system of wide scope, an engineering service to the architect and engineer. We are prepared to present suggestions and make recommendations on any sound-proofing problem that may arise in connection with any class of construction, and the architect and engineer are invited to call upon us at any time in order to avail themselves of this service. It is good policy to go into such matters at the time preliminary plans are being drawn, so that recommendations can be made before full details of construction are arranged.

This service is offered without charge and the recommendations being based on years of experience in this field, to which our entire time has been devoted, eliminates the necessity of working out experimentally such problems on a purely theoretical basis.

Twelve years of successful installations in all parts of the United States form the basis on which all recommendations and specifications are offered.

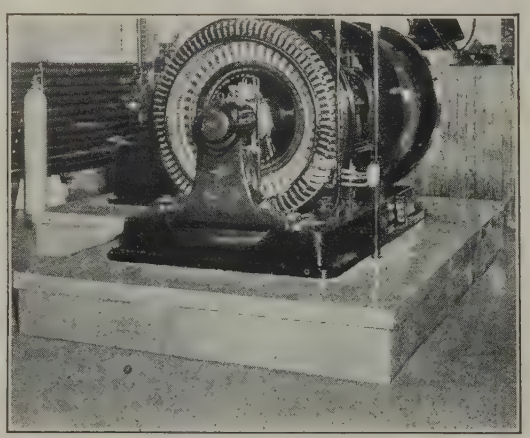
Advantages of Stevens System

Sound is an expansion and contraction of air, and travels in all directions in waves from the source of the sound. Where sound is disturbing within a room due to reverberation or echo, it is a simple matter to place absorbing materials in such a way that the sound will be partially absorbed and a large percentage of the echo eliminated. Sound being a phenomena of the air, the problem becomes more complex when sound is transmitted from one closed room to another, as it is evident there is no passage of air.

It has been fairly well established that the transmission of sound from one room to another is caused by the movement or vibration of the structural parts of the building, which are set in motion by the sound and reproduces that sound wherever it comes in contact with air. Thus, a sound may carry indefinitely through a building, depending on the intensity of the sound and the resistance offered by the materials used in the building. It is, therefore, evident that where absorbing materials are placed under floors or behind partitions or ceilings, that no matter how efficient they may be, that they can not function if the building is all tied together, as the sound will be transmitted by the steel, concrete or other materials.

The Stevens System provides a practical method of breaking the solid connection between the finished surfaces of room and substructures, so that surfaces exposed to sound may vibrate or move without disturbing the substructure, and by using proper absorbing materials in connection with installation absorbs sounds produced by the diaphragmatic action of the finished surface.

Aeolian Hall, New York, N. Y.
Warren & Wetmore, Architects
Organ rooms treated throughout with Stevens System



Ford Administration Building, Ford Motor Co., Fordson, Mich.
Albert Kahn, Architect
Stevens Anti-vibration platform under Brunswick-Kroschell ice machine

Special Uses

In addition to using the system under floors, in partitions, in ceilings and under machinery to prevent passage of sound or vibration, it is also used under ballroom and gymnasium floors to provide resiliency and eliminate fatigue and shock of impact.

Some Installations

Adelphi Theater, Clark and Estes Avenue, Chicago, Ill., J. E. O. Pridmore, architect, Stevens System installed in 1917 in connection with six bowling alleys. Alleys placed on second floor over lobby of theatre and stores, and adjoining theatre auditorium.

Roxy Theatre, Seventh Avenue and 50th Street, New York, N. Y., Walter Ahlschlager, architect. Ventilating fan and motor weighing 6 tons placed directly above the auditorium on Stevens anti-vibration platform.

Elks Club, Milwaukee, Wis., R. A. Messmer & Bro., architects. Ten bowling alleys placed on fourth floor directly above restaurant and directly under main lodge hall.

Stevens Hotel, Seventh Street and Michigan Avenue, Chicago, Ill., Holabird & Roche, architects. All ballroom and banquet room floors treated with Stevens System.

Edsel Ford Residence, Grosse Pointe, Mich., Albert Kahn, architect. All floors above first floor soundproofed under the Stevens System.

Fifth Avenue Theater, Seattle, Wash., R. C. Reamer, architect. Theater was built in connection with an office building, and each lease contained a clause stating that if sounds of theater organs are disturbing the lease may be broken. The two organ chambers were treated on ceilings, floors and partitions with entire satisfaction.

Grosse Pointe Country Club, Grosse Pointe, Mich., Smith, Hinchman and Gryls, architects. All floors treated with Stevens System.

New York Central Office Building, 45th Street and Park Avenue, New York, N. Y., Warren & Wetmore, architects. Walls and ceilings of all elevator machine rooms treated with Stevens System to prevent passage of sound to adjoining offices.

155 East 72nd Street Apartments, 155 East 72nd Street, New York, N. Y., Bing and Bing, owners, Cross and Cross, architects. All floors soundproofed with Stevens System.

Specifications

Furnish and install Stevens System of Sound-proofing as designed and manufactured by the Stevens Sound-Proofing Co., Room 1190, 407 South Dearborn St., Chicago, Ill.

This system to be installed under the specifications and direction of the manufacturer.

CANADIAN MacARTHUR CONCRETE PILE CO., LTD., NEW BIRKS BUILDING, MONTREAL

"A Special Pile for Every Condition—Not One Pile for All Conditions"

The MacArthur Method employs *"A Special Pile for Every Condition—Not One Pile for All Conditions"* but the method of forming each type is such that all can be placed with our standard equipment. Therefore, when unexpected subsoil conditions are encountered and a change in plans becomes suddenly necessary, there is no delay incidental to bringing in equipment for special piles, as the equipment is already on the site and all material used is available locally.

MacArthur Concrete Piles are all cast-in-place piles and are all of the straight shaft type. They include:

Straight Shaft and Pedestal Piles—These are our standard compressed concrete piles. Used for all ordinary soil conditions where piles up to 40 ft. in length are required.

Composite Piles of Concrete and Timber—For use where bottom (timber) section of pile is below permanent water level. More economical than all concrete. Placed in lengths up to 100 ft.

Composite Piles of Concrete and Pipe—Uncased upper section of compressed concrete and lower section of closed end pipe—any length. For use in very soft soils where piles have to be driven to great depths.

Pipe Piles with Cast Steel Point—Filled with concrete to any length. Economical for driving where headroom is limited, such as for underpinning foundations or making new foundations inside existing buildings.

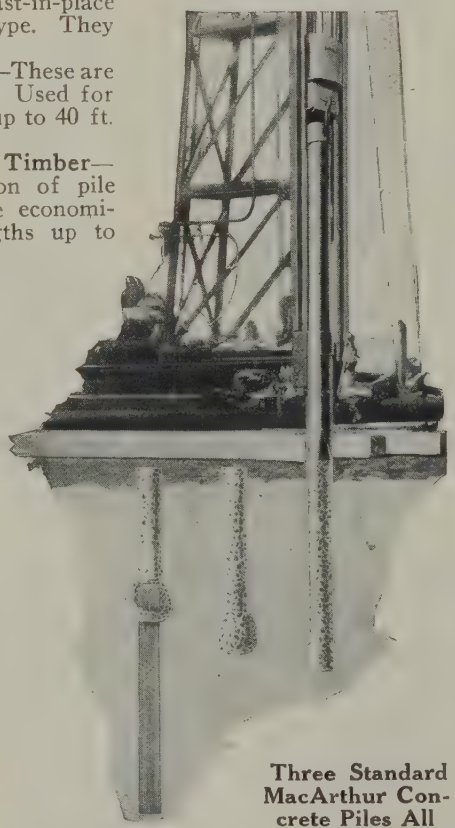
Concrete Slabs for Gas Holders—We have built hundreds of complete foundations (piling and slabs) for gas holders and oil storage tanks. Our experience in this work is a very valuable asset.

Straight Shaft Uncased Compressed Concrete Piles for All Ordinary Soil Conditions

Maximum of Skin Friction—The MacArthur uncased pile calls for a workable dry mix concrete compressed under a weight of 7 tons per pile—after the concrete is poured. This forces a dense, homogeneous concrete into intimate contact with the surrounding soil and gives the maximum of skin friction without any disturbing factor.

The compressed concrete is so much denser than the surrounding soil that it cannot be disturbed, distorted or forced out of place by the driving of adjacent piles as might be the case with a wet uncompacted concrete even though enclosed by a thin metallic casing.

Perfect piles are formed on 2 ft. 6 in. centers in the toughest and most rubbery of clays by this method. Large numbers of excavated piles have proven the certainty of this method.



Three Standard MacArthur Concrete Piles All Formed by the Same Standard Driving Apparatus

Uniform Diameter—The MacArthur Method for uncased compressed concrete piles employs a steel driving shell with walls ½-in. thick and of uniform diameter throughout its entire length. There is no question, when this is driven to penetration, about the shell being intact and absolutely true in diameter throughout while the concrete is being placed. It also makes a pile as strong at the base as it is at the top—a pile with twice the diameter at the base as the ordinary tapered form of pile and with more concrete in each pile.

Concrete Easily Rammed or Compressed—It is a known fact that has been demonstrated by years of practice that concrete should be rammed or compressed after being placed in the forms, so as to secure perfect cohesion and to remove voids caused during pouring.

The MacArthur Method calls for a concrete compressed under a weight of 7 tons in each pile, after the concrete is placed.

"Dry Mix" Concrete Recommended for Cast-in-place Piles—In a cast-in-place pile it is necessary to dump the concrete down a steel shell a considerable distance. Therefore when a wet sloppy mix is used, the sand, cement, water and stone undoubtedly will separate and the chance of the aggregates again arranging themselves in correct proportion when they arrive at their destination is very remote indeed.

The MacArthur Method calls for a water ratio of 6 gal. of water per bag of cement with sufficient coarse aggregates to make what is termed a "dry mix."

Note: See recommendations of Portland Cement Association in their booklet "Design and Control of Concrete Mixtures."

Open Specifications for Cast-in-place Concrete Piles

(For Incorporation in Architect's and Engineer's General Specifications)

Concrete Pile Construction—Concrete piles shall be provided where shown and called for on plans. The price shall be calculated on the basis of .... lineal feet each. Contractors shall state plus and minus price per pile and per lineal foot for actual length driven.

Concrete piles shall be driven to a bearing value as determined by the Engineering-News Formula and if necessary, in the judgment of the architect or engineer, load tests shall be made on (one or more) piles, at the expense of the owner. The total settlement of pile shall not exceed one one-hundredth of an inch per ton of test load applied.

Concrete piles cast-in-place may be straight shaft or tapered. The working load on each pile shall be .... pounds. Piles shall be cast in strong removable steel shells, or light gauge steel reinforced, or corrugated, or plain shells to remain in place.

After the shell has been driven and the driving mandrel withdrawn, the shell shall be tested against collapse or squeezing of the shell out of true shape by again dropping the full sized mandrel to the bottom of the shell. Any shell which is improperly driven, is broken, shows partial collapse, is out of round or otherwise defective shall not be accepted.

Note: In the removable shell type the concrete shall be constantly compressed while the shell is being withdrawn.

Concrete—Concrete shall be mixed in the proportion of 1 part of cement, 3 parts of sand and 5 parts of stone or gravel, all as approved. A water ratio of 6 gal. per bag of cement shall be used as closely as possible so as to obtain a dry enough mix to keep the component parts of the concrete from separating while being poured into the shell. A wet, sloppy mix of concrete shall not be allowed. The concrete shall be tamped as it is being deposited or compressed after it is deposited.

Borings—(State hereafter information on and instructions regarding soil samples and boring diagrams).

Special Notes and Engineering Information on Cast-in-place Concrete Piles

Engineering News Formula—

$$L = \frac{2\,W\,H}{S + 0.1}$$

L = Load in pounds
W = Weight of falling parts in pounds
H = Drop in feet of falling parts
S = Final penetration per blow in inches

A No. 1 steam hammer has a weight of 5000 lb. falling 36 inches.

Pile Length—It is necessary to adopt in the specification a length of pile so as to secure uniformity in the bids. This length can be determined approximately from examination of the borings. (We will be glad to make recommendations covering correct bid length upon receipt of boring data.)

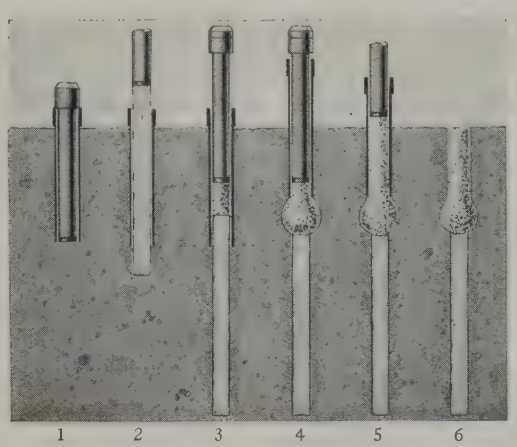
Driving Piles on Standard Centers—A condition is seldom met where the driving of cast-in-place concrete piles on 2 ft. 6-in. centers injures the pile previously driven. If unusual soil conditions are found it should be treated as a special case, rather than needlessly adding to the cost of the operation by arbitrarily specifying piles to be driven in scattered formation, which makes necessary considerable increased cost to the owner. The following is suggested for taking care of this case:

"If it is found that driving adjacent pile disturbs the pile which has just been completed, the engineers (or architects) may require the contractor to deviate from the regular driving method, so as to avoid injury to piles already in place."

Pedestal Piles—It is sometimes found that there is a firm strata of soil lying between layers of poor soil which would sustain the superimposed load if it could be properly distributed by a larger base than is possible with standard diameter piles, thereby making a desirable saving in pile length. Also, in some cases the foot of the concrete pile rests on an inclined rock, which tends to cause a side slip of the pile. The addition of a pedestal overcomes this danger by giving a larger end bearing and more intimate bond.

Reinforced Piles—Piles may be reinforced with single central rod or with a hooped cage without delay in driving operations.

Metal Shoe—In wet or semifluid soils pile forming casing is sealed before driving with a suitable metal shoe.



MacArthur Composite Type (Concrete and Wood Pile)

(1) Core and casing driven into ground.
(2) Core withdrawn and square timber placed in casing.
(3) Timber guided by casing, driven down to give necessary bearing. Butt of timber below ground water level. Core withdrawn, batch of concrete deposited in casing on top of timber and core replaced.
(4) Casing raised necessary distance, pedestal joint formed around top of timber insuring perfect juncture between timber and concrete.
(5) Core withdrawn, sufficient concrete deposited to provide for voids and space occupied by casing. Casing then steadily withdrawn with 7-ton pressure remaining constantly on the concrete.
(6) Finished shaft well knitted and bonded to soil

RAYMOND PRE-CAST PILES: Bearing and Sheet.
CONCRETE WORK of a Special Nature.

Slogan

A form for every pile—
A pile for every purpose.

Concrete Piles vs. Wood Piles

There are certain fundamental advantages that concrete piles have over the use of wood piles. Wood piles must be driven so that the cut-off is below permanent water line, whereas concrete piles may be cut off at any level, irrespective of the permanent water line. Wood piles are often broomed or broken while being driven, thus reducing, if not eliminating their supporting power, whereas the Raymond type of concrete pile is not subject to distortion in driving.

In marine work, wood piles most frequently are creosoted for protection against marine borers, whereas concrete piles are not subject to such destruction. Wood piles very often require considerable shoring, underpinning, sheeting, pumping and deep excavation, whereas this can usually be eliminated partially, if not entirely, by the use of concrete piles. Furthermore, there is an important saving in time by the use of concrete piles, as the footings can be placed immediately after the concrete pile has been driven.

Classification of Concrete Piles

Concrete Piles are of two distinct types:
(1) Concrete piles, which are made in place, commonly referred to as "cast-in-place" concrete piles.
(2) Concrete piles which are cast in moulds and then driven like wooden piles and are referred to as "pre-cast" concrete piles.

Cast-in-place piles are divided into two classes:

(a) Those in which a form is left in the ground to preserve the integrity of the finished pile.

(b) Those in which the concrete is placed by means of a temporary driving form which is removed before the concrete hardens and leaves the pile confined only by the loose earth. The green concrete is then, obviously, subject to the admixture of foreign materials, excess of water and distortion due to strains set up by soil pressures and the driving of adjacent piles.

Pre-cast concrete piles are those which are cast in a mould and then driven like a wooden pile and are referred to frequently as "pre-cast concrete piles."

The Raymond Method

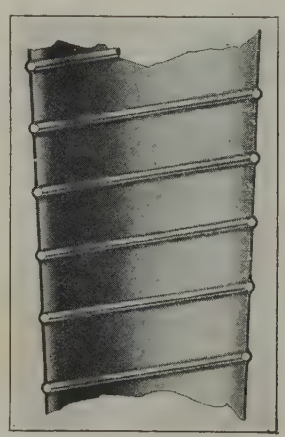
A collapsible steel core, usually 8-in. diam. at the point and increasing in diameter at the rate of 0.4 in. per lin. ft. of length, is incased by a spirally reinforced steel metal shell. The core, thus incased, is driven to a proper penetration in accordance with the *Engineering News* formula. It is then collapsed and withdrawn from the shell, the shell remaining in the ground and maintaining the resistance encountered in the driving. The shell is then inspected and if found perfect from tip to top is filled with concrete, making a perfect concrete pile.

Under certain conditions we use a core with a larger diameter at the point.

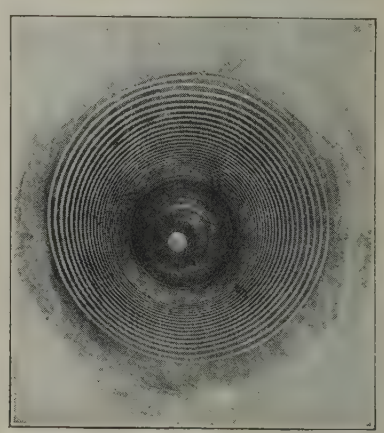
Loads and Spacing—Usually Raymond concrete piles are driven to carry a working load of 30 tons each, but in some cases, loads of from 35 to 40 tons are safely carried.

A working load of 30 tons per pile is accepted by all building departments. The usual spacing of Raymond concrete piles is 2 ft. 6-in. centers for piles less than 30 ft. in length, and for piles in excess of 30 ft. in length, a spacing of 3-ft. centers is more desirable. In view of the very wide variation in soil conditions and other difficulties surrounding a job, it is suggested that the nearest Raymond office be conferred with, so that the site can be investigated and recommendations made.

Sizes and Weight of Material—The standard Raymond concrete pile is installed by the use of a pile core 8-in. diam. at the point and increasing in diameter 0.4 in. per lin. ft. of length. For instance, a pile 20 ft. in length would be 16-in. diam. at the top, while one 37 ft. long would have a top diameter of 22.8 in.



Section of Spiral Shell



Looking Down Into a Driven Shell—30-ft. Long

Continued on next page

The present limit in length of a standard Raymond concrete pile is 37 ft. 6 in. Where conditions are such as to require piles of greater length, we call attention particularly to the Raymond composite pile, a description of which will be found on the next page.

Working Loads—In calculating the resistance to penetration, the *Engineering News* formula, based on using a steam hammer, has been found most satisfactory. This formula follows:

$$L = \frac{2\,W\,H}{S + 0.1}$$

L=Load in pounds
W=Weight of falling parts in pounds
H=Drop in feet of falling parts
S=Final penetration per blow in inches

A No. 1 steam hammer has a weight of 5000 lb. falling 36 inches.

A No. 2 steam hammer has a weight of 3000 lb. falling 30 inches

Thus the carrying capacity of the Raymond concrete pile is not a matter of guesswork or speculation, but is susceptible of computation and demonstration.

Advantages of Taper—The Raymond concrete pile possesses an extreme taper and offers a maximum resistance for a given length. This has been proved by a comprehensive record of resistance encountered in driving plus an extensive series of loading tests, during which the real carrying power of the pile has been checked with the driving resistance.

Prices—The Raymond concrete pile is "made-in place" and not sold by the foot, f. o. b. cars, consequently it is impossible to quote prices without knowing the conditions under which the work is to be done. For even approximate prices, it is necessary to have some knowledge of the number of piles, probable length, the approximate spacing, soil conditions, accessibility of the site, etc.

Points of Superiority of Raymond Concrete Piles—

(1) Absolute permanency: immunity from decay or from the attacks of wood borers and destroyers.

(2) Economy, because of greater carrying capacity—meaning a less number of piles for a given load. The greater carrying capacity rests upon several points—to wit:

(a) Greater size, therefore greater displacement and frictional area.

(b) Greater taper, therefore greater frictional value per square foot.

(c) Perfect shape, therefore perfect contact with the ground at every point.

(d) Possibility of inspection after driving, hence the ability to load to full capacity, instead of making a large allowance for inefficiency as in the case of wood piles subject to injury by overdriving, telescoping, departing from the vertical, and like defects, none of which are discernible at the moment when correction is possible.

(e) Decreased length of pile as a natural consequence of greater size and taper.

(3) Smaller and lighter footings, because of decreased number of piles.

(4) Decrease in total load to be carried, because of decreased weight of footings.

(5) Practical elimination of shoring, underpinning, sheeting, pumping and deep excavation and the reduction of masonry.

(6) Due to decreased number of piles and consequent reduction in width of wall footings, the center line of columns can be brought nearer to the building line.

(7) Important saving in time caused by:

(a) The smaller number of piles required.

(b) The reduction in the amount of excavation, shoring, sheeting and pumping.

(c) The reduction in quantities of footing or masonry.

(d) Manufacture of the pile in place, from materials readily procurable in all localities, and limit of manufacture to the actual number and exact length of piles required. There is no delay for cutting and trimming trees, hauling to shipping point, transporting for great distances by rail or water and delivery to the job, perhaps only to find that the piles are too long or too short.

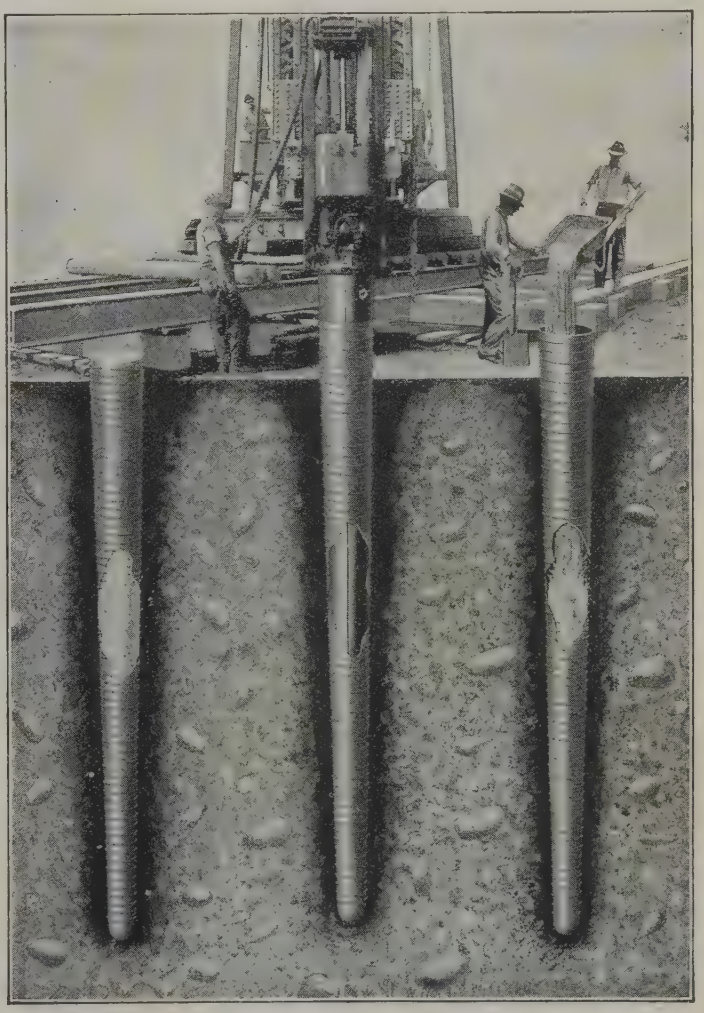
Specification—If "Raymond concrete piles" are called for, this is of course sufficient. On the other hand, if it is for any reason inadvisable to name them specifically the following specifications will cover:

"Concrete piles shall be of a type specifically approved by the architect or engineer, and shall be placed in the following manner:

"A collapsible steel mandrel or pile core 8 in. in diameter at the small end and 20 in. in diameter 30 ft. from that point shall be incased in a spirally reinforced steel shell and driven to a proper penetration. The pile core shall then be collapsed and withdrawn from the shell. Before placing the concrete, each shell shall be inspected and, being found perfect, shall thereupon be filled with concrete placed in accordance with the best practice."

or

"Moulded-in-place piles shall be of a type suitable for the conditions and subject to the approval of the architect or engineer. They shall be formed in casings left in place, which shall be of sufficient strength to prevent distortion or bulging after mandrel has been withdrawn and while the cavity is being filled with concrete or during the driving of adjacent casings."



Essential Steps in the Making of a Raymond Concrete Pile

Continued on next page

More About the Raymond "Cast-in-place" Pile

The Raymond pile is the only concrete pile employing the spirally reinforced driven casing as a permanent form to remain in the ground. This feature is essential for perfect dependable results. The province of the form or shell is manifold:

(1) To serve as a form for the piles.
(2) To prevent the admixture of foreign substances.
(3) To retain the original moisture in the mixture until the concrete is thoroughly hardened.
(4) To prevent distortion by external pressure, due to the driving of adjacent piles or accumulated pressures from displacement by the pile itself.
(5) To perfectly retain the displaced earth forming the walls of the cavity, so that there may be no relaxation of the ground and therefore no loss of resistance when the displacing force (the core) is removed.
(6) To act as reinforcement of the pile until the concrete shall have attained its maximum strength.

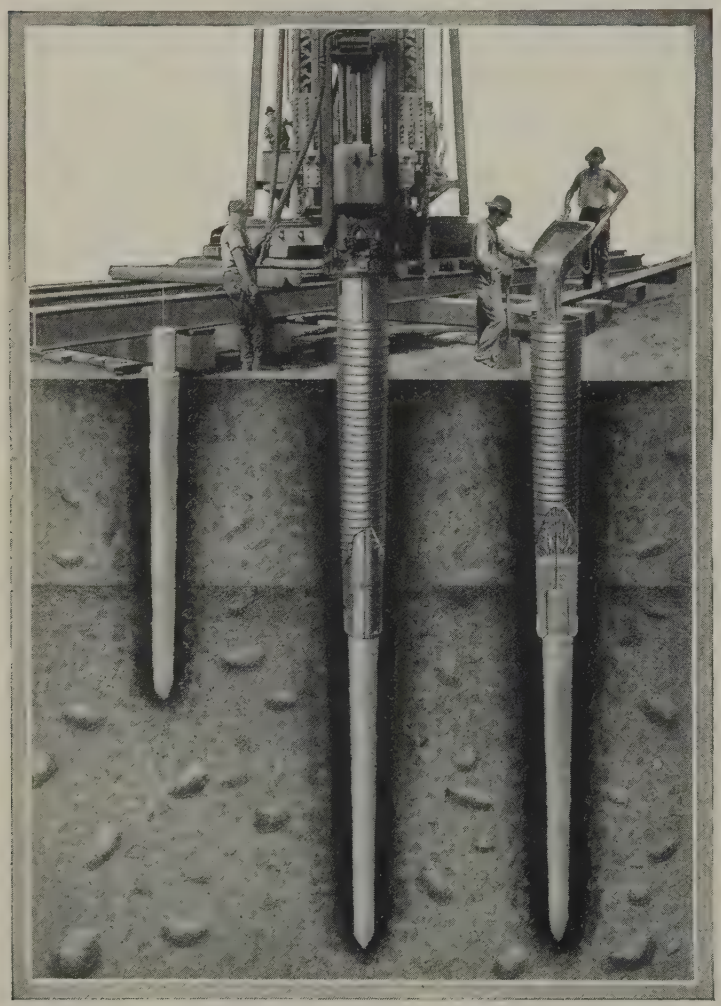
Raymond Composite Piles

For use where depths greater than 37 ft. 6 in. are encountered, we have developed a composite pile made up by superimposing a Raymond concrete section on a previously driven wooden pile.

The wood pile is ultimately driven so that its top is below the permanent water level and from that point to the bottom of the footing is a standard Raymond concrete pile, as fully illustrated below.

Pre-cast Piles

Pre-cast piles have a large and useful field, particularly in marine structures, such as docks, bulkheads, etc.



Raymond Composite Pile

The Raymond Concrete Pile Company is prepared, through its experience, to give good advice upon the use of "pre-cast piles," and also to design and construct work in which a pre-cast pile can be used economically and advantageously.

Special Concrete Construction

In addition to the placing of standard Raymond concrete piles for foundation of structures on land, we construct and design permanent docks, piers, bulkheads, trestles, storage bins, retaining walls, bridges, heavy foundation, shipways, drydocks, etc.

Each problem requires special study for solution and our experienced organization is yours to command.

Services and Facilities

Our staff of experts is at your service, to assist in the designing and installation of concrete piles for all purposes and to meet all conditions.

Engineering—Our engineering department is available to architects and engineers at all times for investigation work and consultation, and we will gladly submit recommendations, designs and estimates covering any problem within the scope of our business.

Equipment—Every Raymond driver is built of structural steel, scientifically designed for the most rapid and economical construction, and the major portion of our equipment is built in our own machineshops.

References

Since 1901 when the first Raymond concrete pile was placed, we have placed up to December, 1927, more than 25,000,000 ft. of Raymond concrete piles throughout the United States, covered by over 2400 separate and individual contracts. We shall be pleased to have you refer to any of the many engineers, architects, owners, and general contractors with whom we have been associated.

Products and Services

Simplex Concrete Piles: Cast-in-place, Pre-cast and Composite.

Engineers and Contractors for Concrete Construction; Engineers and Contractors for Foundations for Chimneys, Tanks, Buildings, etc.; Caissons for Concrete Construction.

Also Steel Incased Concrete Piles.

We will submit recommendations, designs and estimates on receipt of necessary data, or will visit the site of prospective work at any time for purposes of investigation and consultation, and without obligation.

Specific Types of Piles for Specific Conditions

No one type of concrete pile has as yet been designed that will economically and successfully meet all conditions of soils and loadings. We have developed several methods of installing concrete piles enabling us to meet successfully every condition.

Simplex piles are of proved worth. They have been used extensively in the United States and Europe since 1903 for supporting buildings and other structures.

Advantages of Simplex Concrete Piles

Simplicity; easily and quickly installed.

Certainty of results.

Durability equal to that of natural rock; renewals never required.

Greatest frictional surface. Unsurpassed carrying power.

Economy in time and cost over other types of foundations.

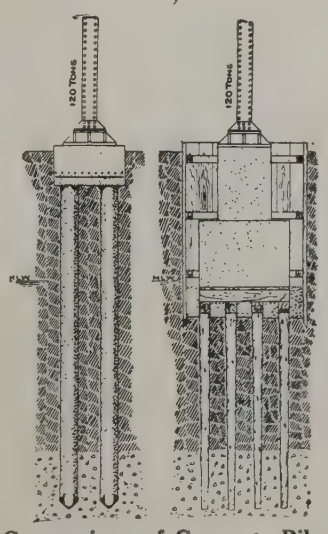
Load transferred to firm bearing strata without reference to or dependence on poor soil above, although taking full advantage of it in addition to the end bearing value.

16 in. in diameter at top, 16 in. in diameter at the bottom; this pile with the big cast iron base gives 1½ sq. ft. in the hard pan on which you depend for carrying the loads.

Standard Simplex Cast-in-place Concrete Piles

Are suitable for nearly all conditions met with in unreliable ground. A cylindrical steel form, fitted with a cast iron point (joint is watertight) is driven to proper depth and filled with wet concrete. Form is withdrawn and the concrete is molded against the rough, compacted walls of the hole, resulting in tremendous skin friction in addition to its end bearing. *The concrete is placed before removal of form.*

In no case of Simplex pile construction has it been found that the back pressure of the earth was as great as the weight of the column of concrete in the pile. Reinforcement may be used, if desirable.



Comparison of Concrete Pile and Wood Pile Foundations

Standard Simplex concrete piles are 16-in. diam. their entire length; they have been driven to depths of 75 ft. Working load is usually 30 tons per pile, fully justified by long experience and many tests. Load may be varied in special cases.

Under average soil conditions, a spacing of 3 ft. on centers produces the best results.

Specification—Concrete piles shall be made-in-place by driving to proper penetration a 16-in. diameter steel pipe fitted at its lower end with a detachable cast iron point. This pipe shall be filled with concrete to the proper height and then it shall be pulled out of the ground, leaving the cast iron point in the ground and a shaft of concrete completely filling the hole to its compacted walls.

Greatest Compression of Soil Immediately About the Pile

Disturbance ceases about one diameter from pile

Simplex Pre-Cast Concrete Piles

Are used for foundations for docks, wharves, sea walls and other water work, and for foundations where the ground is unusually unsatisfactory. A form is driven to proper depth as in the standard system. A small amount of wet concrete is poured into the form. A pre-cast reinforced concrete pile is lowered through the form; the projecting ends of the reinforcement extend into the wet concrete. The form is then withdrawn, leaving the pre-cast pile in position. Thin grout poured into the form as it is withdrawn materially increases skin friction in some cases. This method admits of positive results as to penetration without striking a blow on the pre-cast pile and entirely avoids the questionable consequences of jetting.

Standard size is 13 in. octagonal section and 40 ft. in length, but can be installed in larger diameters and to greater depths.

Simplex Composite Piles

Economically meet soil conditions requiring great depth of penetration, where the permanent water line is considerably below the surface. A wood pile of required length and diameter is driven to proper depth, upon which is constructed a standard Simplex concrete pile. This method lends itself to the modifications of the standard system and readily admits the use of a pre-cast concrete pile on top of the wood pile.

WESTERN FOUNDATION COMPANY

Engineers and Contractors

308 West Washington Street
CHICAGO, ILL.

Products

FOUNDATIONS of all types.
PILES.
CAISSONS.

Foundations of All Types

Where the soil conditions are such as to require special foundations the WESTERN FOUNDATION COMPANY finds its field of activity. We are prepared to discuss with architects and engineers any standard type of foundations, i.e., concrete piles, composite piles, caissons, steel pipe piles, wood piles and steel and wood sheeting.

Our Service

Being prepared to execute any type of foundation work, we are enabled to install not one particular type of foundation on a given job but the most economical type for the soil conditions. It sometimes happens that on a single job several types of foundations are desirable. In one recent job, there were piers, open caissons, blown-out steel pipes, compressed concrete piles, composite piles and wood piles, all of these being carried to rock, which in one part of the building was above the water line and in another part below the water line.

Being prepared to execute various types of foundations, we are also in a position to discuss with architects and engineers the cost of various types. Our engineers have had many years of experience in foundation work. We are very glad to have them call upon architects and discuss with them their foundation problems when they are studying a job and making preliminary cost estimates, so that the most economical type of foundation can be determined and the plans prepared accordingly.

Our Concrete Piles

Experience has shown that satisfactory results with concrete piles cannot be obtained by using the same type of pile for all soil conditions. In some cases the compressed type of pile is the most satisfactory. In other cases the soil is such that it is desirable to protect the concrete with a metal casing. In some other soils it is desirable to make a pile with an enlarged base so that the load may be carried through a soft stratum on to a firm stratum. Again the load conditions may be such that a pile of small diameter will be entirely satisfactory, or the load may be so great that it is necessary to have a pile of large diameter in order to keep the stresses in the concrete within safe limits.

All of these varying conditions can be and have been taken care of by us in an economical and satisfactory manner.

Who Is The Western Foundation Company and What Do They Do?

The WESTERN FOUNDATION COMPANY is a new company, having been incorporated in 1924. It is made up of men who have had many years of experience in foundation and structural work—consequently the plant and equipment is thoroughly modern and has many new features. Our first job was started in October, 1924. We have had work for the following to whom we would refer any one that may be interested:

Architects

Alfred S. Alschuler, 28 East Jackson Boulevard, Chicago, Ill.
John Archibald Armstrong, 127 No. Dearborn Street, Chicago, Ill.
Bennett, Parsons & Frost, 80 E. Jackson Boulevard, Chicago, Ill.
Condron & Post, 53 W. Jackson Boulevard, Chicago, Ill.—2 jobs
Folz & Brand, 510 No. Dearborn Street, Chicago, Ill.
Graham, Anderson, Probst & White, 80 E. Jackson Boulevard, Chicago, Ill.—3 jobs
Harry Hake, 2400 Gilbert Avenue, Cincinnati, Ohio—3 jobs
Holabird & Roche, 333 No. Michigan Avenue, Chicago, Ill.
Albert Kahn, Marquette Building, Detroit, Mich.
Kirchoff & Rose, 210 Sycamore Street, Milwaukee, Wis.
M. J. Morehouse, 343 So. Dearborn Street, Chicago, Ill.
Schmidt, Garden & Erickson, 104 So. Michigan Avenue, Chicago, Ill.
Smith, Hinchman & Grylls, Marquette Building, Detroit, Mich.
Thielbar & Fugard, 219 E. Superior Street, Chicago, Ill.

Contractors

Austin Company, Cleveland, Ohio—2 jobs
Avery Brundage, 110 So. Dearborn Street, Chicago, Ill.—3 jobs
William Baehr Organization, 232 So. Clark Street, Chicago, Ill.
A. Bentley & Sons, Toledo, Ohio
Bartlett Hayward Co., Baltimore, Md.—2 jobs
Carmichael Construction Co., Akron, Ohio
Contracting & Materials Co., 42 E. Pearson Street, Chicago, Ill.
Ferro Concrete Construction Co., Third and Elm Streets, Cincinnati, Ohio—2 jobs
T. J. Forschner Contracting Co., 39th Street and 52nd Avenue, Cicero, Ill.—2 jobs
John Griffiths, Builders Building, Chicago, Ill.—2 jobs
Hegeman-Harris Co., Tribune Building, Chicago, Ill.
J. H. Johnson, 612 No. Michigan Avenue, Chicago, Ill.
Kelly-Atkinson Construction Co., 189 W. Madison Street, Chicago, Ill.—2 jobs
M. A. Long Co., 10 W. Chase Street, Baltimore, Md.
MacDonald Engineering Co., 53 W. Jackson Boulevard, Chicago, Ill.—5 jobs
Mutual Construction Co., 2532 Warren Avenue, Chicago, Ill.
South Parks Board, Linn White, Chief Engineer, 57th and Cottage Grove Avenue, Chicago, Ill.—12 jobs
Turner Construction Co., 6 No. Michigan Avenue, Chicago, Ill.
R. C. Wieboldt Co., 1534 Van Buren Street, Chicago, Ill.—4 jobs

Owners

Alpha Portland Cement Co., Easton, Pa.—2 jobs
Battle Creek Gas Co., Battle Creek, Mich.—2 jobs
Battle Creek Sanitarium, Battle Creek, Mich.
Sanitary District of Chicago, 910 So. Michigan Avenue, Chicago, Ill.—3 jobs
Eckhart Milling Co., 1320 Carroll Avenue, Chicago, Ill.
Evansville Portland Cement Co., Catasaqua, Pa.
Ford Motor Co., Detroit, Mich.—2 jobs
W. H. Holliday Co., Indianapolis, Ind.—2 jobs
International Portland Cement Co., New York, N. Y.
May Company Department Store, Akron, Ohio
Michigan Bell Telephone Co., Flint, Mich.
National Biscuit Co., 110 No. Morgan Avenue, Chicago, Ill.
North American Cement Co., Albany, N. Y.
North Shore Coke & Chemical Co., Waukegan, Ill.
Pittsburgh Plate Glass Co., Oregon and Barclay Streets, Milwaukee, Wis.
Union Stock Yards Co., Cincinnati, Ohio—2 jobs

We would call particular attention to the fact that, although we have been operating less than five years, we have had many repeat orders. Notice the number of jobs we have had with the same owners, architects and contractors.

In many cases, after we have had one job, we have been given the second and succeeding jobs without competition. This can mean but one thing—satisfaction.

LAWRENCE PORTLAND CEMENT COMPANY

SALES OFFICE

302 Broadway

NEW YORK, N. Y.

DISTRICT OFFICES

BOSTON, MASS., 31 Milk Street

Products

DRAGON PORTLAND CEMENT.
DRAGON SUPER CEMENT.
DRAGON STRONGFAST CEMENT.
DRAGON MAINROK LIME.

Dragon Portland Cement

Quality—Dragon Portland Cement, increasingly used since 1889, surpasses the specifications for portland cement of the American Society for Testing Materials, as well as standard specifications of the Government, railroads and technical societies such as the A.I.A., A.S.C.E., A.R.E.A. and A.E. Standards Committee. Because of its excess strength above standard requirements, Dragon Portland Cement has become known as the cement that is "Forty per cent above standard."

Dragon Super Cement

A tanno catalyzed portland cement made under the direction of The Super Cement Company. Used in accordance with approved standard practice for portland cement, Dragon Super Cement produces concrete that is inherently impermeable to liquids. This obviates all need for membranes, surface treatment or admixtures for waterproofing or surface hardening. Without any supplementary treatment whatever, Dragon Super Cement produces concrete of maximum plasticity and density, waterproof, wearproof and oilproof. It is highly resistant to frost, seawater, acids, alkalis and other destructive agencies.

Literature Available—A book titled "How, Why, Where" gives complete data and describes important structures in which Super Cement has been applied during the past decade.

Dragon Strongfast Cement

A high early strength special portland cement for use where time is an important element and early use of concrete work is essential.

Dragon Mainrok Lime

Analyzes 98% available lime and yields 12 to 13 cu. ft. of putty per 280 lb. barrel. Dragon Mainrok Lime is rigidly graded, inspected and tested to insure that every barrel meets these standards of quality.

Shipping Territory

Dragon Cement is manufactured at Siegfried, Pa., in the heart of the Lehigh Valley and at Thomaston, Maine in "New England's Own and Only Cement Mill." The location of these mills permits economic and expeditious distribution throughout New England, the Middle Atlantic States, Delaware, District of Columbia, Maryland and Virginia. In this territory it is possible to secure the excess value of Dragon at no excess cost. Dragon Mainrok Lime, produced at Thomaston, Maine, is available throughout New England.

Output

The combined capacity of the mills producing Dragon Cement is approximately four million barrels per year. Unusually ample storage facilities at the mills are utilized to the end that all rush orders, no matter how large, may always be shipped on the same day that the order is received.

ATLAS-WHITE PORTLAND CEMENT.
Sales Agent for ATLAS LUMNITE CEMENT.

TRADE-MARKS

Quality

Atlas Portland Cement—Over a period of more than 37 years, Atlas Portland Cement has merited the distinction of being "the Standard by which all other makes are measured."

It is guaranteed to pass the Standard Specifications for portland cement which have been adopted by:

The United States Government
The American Engineering Standards Committee
The American Society for Testing Materials
The American Society of Civil Engineers
The American Institute of Architects
The American Railway Engineering Association

"Atlas-White Portland Cement"—Atlas-White Portland Cement (white) has been manufactured for more than 18 years and is identical in strength and durability with Atlas Portland Cement (gray).

Atlas-White Portland Cement is guaranteed to pass the Standard Specifications for portland cement as noted above.

Atlas Lumnite Cement

Gives full strength 28-day concrete within 24 hours.

A slow setting, quick hardening hydraulic alumina cement for concrete and mortar.

Permits pouring concrete one day, putting it in use with safety the next day.

For any concrete work where speed is desirable or necessary.

Packages

Atlas Portland Cement is packed in duck or paper bags of 94 lbs. net weight, 4 bags to the barrel. For export, it is shipped in especially constructed and lined barrels of 400 lbs. gross or 376 lbs. net weight.

Atlas-White Portland Cement is packed in paper and duck bags, and for export, in barrels. Same weights as above.

Publications

"Stucco—Interior Plastering—Graffito"
"Atlas-White Portland Cement for Remodeling with Stucco"
"Atlas-White Portland Cement for Swimming Pools"
"Atlas-White Portland Cement for Mortar"
"Atlas-White Portland Cement for Terrazzo"
"Atlas-White Portland Cement for Ornamental Cast Work"
"Atlas-White Portland Cement for Railroad, Highway and Municipal Uses"
"Houses of Stucco"

Technical and Research Department

A technical and research department is at the disposal of architects for assistance in any problems pertaining to concrete or stucco. This service is, of course, offered without obligation to them and it is hoped that architects will freely avail themselves of this department.

Uses of Atlas-White Portland Cement

(1) Wherever a pure color or white is desired.
(2) For non-staining mortar.

Specific Uses—

Stucco—Makes possible a wide range of color effects. As Atlas-White is neutral in color toward pigments, it gives clear and unmuddied shades. Also produces excellent results when used in connection with exposed aggregates, or when mixed with naturally colored sands.

Brick Joints—Makes possible a pure white or correctly colored joint. Can be colored by mixing directly with a colored sand or by pigments.

Cast Stone, Trim and Garden Furniture—Gives white or colored effects as desired.

Terrazzo—White cement when used for this purpose doubles the number of color combinations. It will not discolor.

Swimming Pools—Used with white sand and applied as a plaster or throughout the concrete gives an inexpensive, durable and attractive finish. Particularly adapted to outdoor pools.

Interior Plastering—Interior plastering of white cement mortar makes possible interesting color and textural effects. As it is unaffected by moisture, it is also used for dairies, cold storage rooms and lavatories.

For Its Non-staining Qualities—

Pointing, Setting and Backing Fine Stone—Widely used for setting Indiana limestone and marble. Gives the strongest possible mortar and is absolutely non-staining to any stone which in itself contains no staining elements.

Setting Tile—Will not stain the tile and is unaffected by moisture.

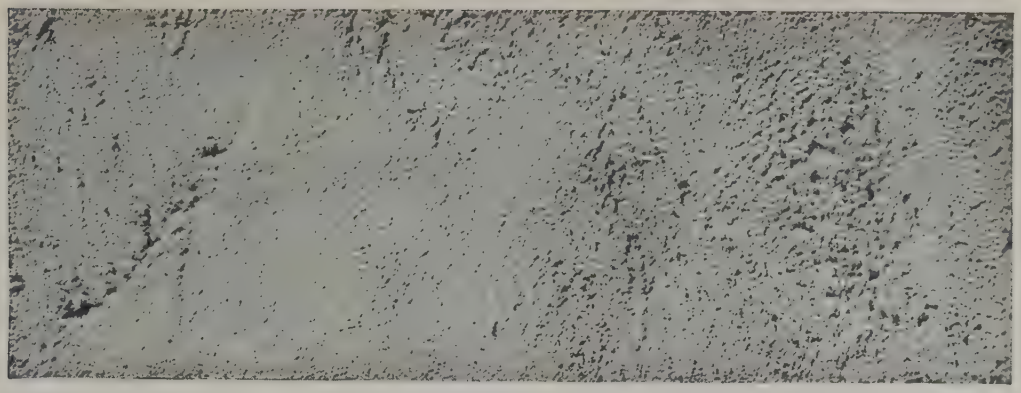
Stucco Finishes

The illustrations show only four of the endless variety of stucco finishes which are possible with the use of a portland cement stucco using Atlas-White.

The endless number of textures possible are produced by various methods of manipulation of the plastic material. While it is difficult to describe in detail the exact method by which they are obtained, an examination by the architect of the photographs in "Stucco—Interior Plastering—Graffito," the book referred to above, will make the manner of finishing evident.

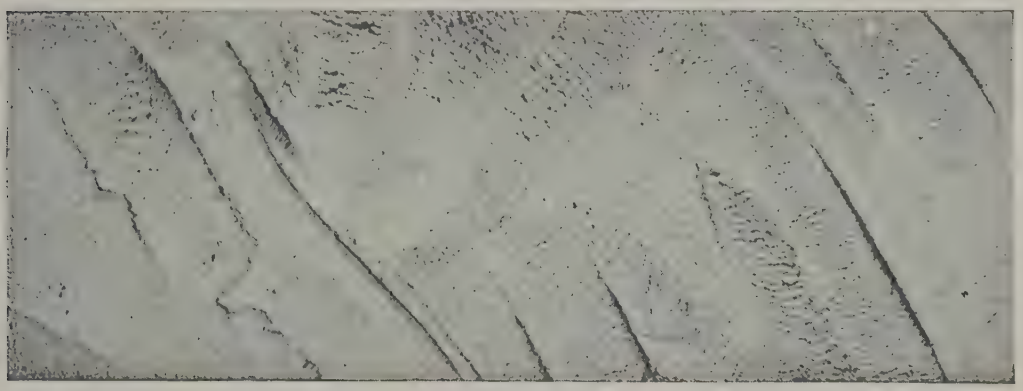
Stucco finishes in portland cement are unlimited as to texture and color. To secure permanently successful results in color and durability, Atlas-White Portland Cement is the ideal material.

Continued on next page



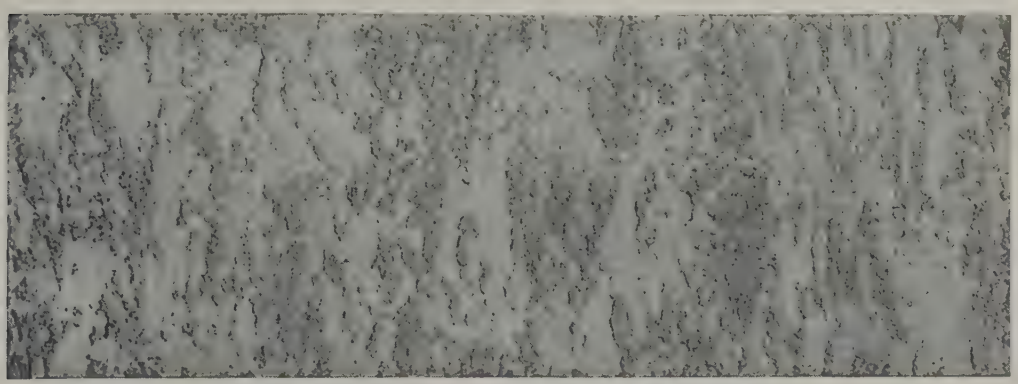
Stucco Finish Used on House at Forest Hills, L. I.

The house, portion of which is shown, was designed by W. L. Bottomley, New York City. The finish is from an actual wall and shows a rather dry mix applied with irregular pressure and motion of the trowel



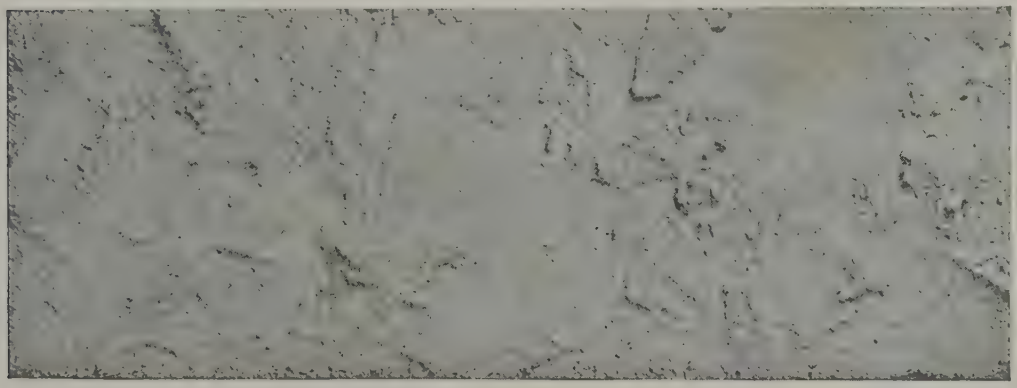
Stucco Finish Used on House at Pelham, N. Y.

This house, for which Bloodgood Tuttle of New York was the architect, is particularly pleasing in its use of stucco. The panel shows a finish placed with a sweep of the trowel, using more pressure on one end than the other



Stucco Finish Used on House at Jamestown, N. Y.

A. J. Bodker of New York was the architect for this residence. The finish was obtained by throwing on a spatter dash and smoothing the high parts with a steel trowel



Stucco Finish Used on House at Riverdale, N. Y.

The adaptability of stucco to harmonize with architectural design is evident in this house for which Julius Gregory was the architect. The panel shows a finish obtained with a rather dry mix applied with an irregular motion of the trowel

PORTLAND CEMENT ASSOCIATION

VANCOUVER, B. C. WASHINGTON, D. C.

Purpose

The Portland Cement Association is a national organization to improve and extend the uses of concrete.

This phrase states in formal language the purpose of the Portland Cement Association. It is a service organization, supported by the manufacturers of portland cement, for the benefit of users and prospective users of concrete.

In November, 1928, the Association completes twenty-six years of existence. Since 1915, its service has been available on a truly national scale.

Concrete is a basic material in nearly every form of construction. Research has developed the laws which control the strength of concrete, as well as other important characteristics. Inventive craftsmanship has developed applications of concrete for artistic decoration which were unknown a few years ago. An attempt has been made to convey brief and somewhat general information about these fundamental laws and new applications in the four pages following.

It is impossible in this limited space to present all of the information that may be desired. Inquiries for more complete data are invited, and may be addressed to the nearest district office in the list given on this page.

STANDARD SPECIFICATIONS FOR PORTLAND CEMENT

A.S.T.M. Serial Designation: C 9-26

Definition

(1) Portland cement is the product obtained by finely pulverizing clinker produced by calcining to incipient fusion an intimate and properly proportioned mixture of argillaceous and calcareous materials, with no additions subsequent to calcination excepting water and calcined or uncalcined gypsum.

I. Chemical Properties

(2) The following limits shall not be exceeded:

Loss on ignition, per cent	4.00
Insoluble residue, per cent	0.85
Sulphuric anhydride (SO_3), per cent	2.00
Magnesia (MgO), per cent	5.00

II. Physical Properties

(3) The residue on a standard No. 200 sieve shall not exceed 22 per cent by weight.

(4) A pat of neat cement shall remain firm and hard, and show no signs of distortion, cracking, checking, or disintegration in the steam test for soundness.

(5) The cement shall not develop initial set in less than 45 minutes when the Vicat needle is used or 60 minutes when the Gillmore needle is used. Final set shall be attained within 10 hours.

(6) The average tensile strength in pounds per square inch of not less than three standard mortar briquets (see Section 47) composed of one part of cement and three parts of standard sand, by weight, shall be equal to or higher than the following:

Age at test, days	Storage of briquets	Tensile strength, lb. per sq. in.
7	1 day in moist air, 6 days in water	225
28	1 day in moist air, 27 days in water	325

(7) The average tensile strength of standard mortar at 28 days shall be higher than the strength at 7 days.

III. Packing, Marking and Storage

(8) The cement shall be delivered in packages as specified with the brand and name of the manufacturer plainly marked thereon, unless shipped in bulk. When shipped in bulk, this information shall be contained in the shipping advices accompanying the shipment. A bag shall contain 94 lb. net. A barrel shall contain 376 lb. net. All packages shall be in good condition at the time of inspection.

(9) The cement shall be stored in such a manner as to permit easy access for proper inspection and identification of each shipment, and in a suitable weather-tight building which will protect the cement from dampness.

IV. Inspection

(10) Every facility shall be provided the purchaser for careful sampling and inspection at either the mill or at the site of the work, as may be specified by the purchaser. At least 12 days from the time of sampling shall be allowed for the completion of the 7-day test, and at least 33 days shall be allowed for the completion of the 28-day test. The cement shall be tested in accordance with the methods hereinafter prescribed. The 28-day test need not be made if waived by the purchaser.

V. Rejection

(11) The cement may be rejected if it fails to meet any of the requirements of these specifications.

(12) Cement remaining in storage prior to shipment for a period greater than 6 months after test shall be retested and shall be rejected if it fails to meet any of the requirements of these specifications.

(13) Cement shall not be rejected on account of failure to meet the fineness requirements if upon retest after drying at 100° C. for one hour it meets this requirement.

(14) Cement failing to meet the test for soundness in steam may be accepted if it passes a retest using a new sample at any time within 28 days thereafter. The provisional acceptance of the cement at the mill shall not deprive the purchaser of the right of rejection on a retest of soundness and time of setting at the time of delivery of cement to the purchaser.

(15) Packages varying more than 5 per cent from the specified weight may be rejected; and if the average weight of packages in any shipment, as shown by weighing 50 packages taken at random, is less than that specified, the entire shipment may be rejected.

Note: The American Society for Testing Materials, 1315 Spruce Street, Philadelphia, Pa., will furnish complete information on the standard tests and test methods for determining physical and chemical properties of Portland cement. Our booklet "Standard Specifications and Tests for Portland Cement" also gives this information and may be obtained by addressing our nearest district office.

PORTLAND CEMENT CONCRETE

Proportioning Concrete

Extensive research in the past 10 to 15 years has resulted in a new method of proportioning concrete mixtures by which it is possible to design mixes that will have definite strengths and other qualities. It has been found that for given materials and methods of manipulation, the strength, watertightness and ability to withstand weathering depend upon the amount of mixing water used. The less mixing water used the stronger will be the concrete and the more watertight and weather resistant. The mixtures must be workable, completely filling the forms and surrounding the reinforcement without excessive spading. With fixed quantities of cement and water the amount and proportions of aggregates may be adjusted to give the workability necessary for the particular job without affecting the strength so long as the mixture is plastic. This discovery has led to the water-cement ratio specification for concrete, given below in abbreviated form:

Specifications for Concrete

Water-Cement Ratio—Concrete shall be proportioned to give the necessary workability without exceeding the quantities of mixing water given in the following table:

Class of Concrete	Desired compressive strength at 28 days, lb. per sq. in.	Maximum quantity of mixing water, U. S. gal. per sack cement
A[1]	3000	6
B[2]	2500	6¾
C[3]	2000	7½
D[4]	1500	8¼

[1]Suitable for roadways, piles, pressure pipe, tanks, thin structural members and walls, dams, piers, etc., exposed to severe action of water and frost.

[2]Suitable for sewers, bridges, walls, dams, piers, etc., subject to moderate action of water and frost.

[3]Suitable for ordinary reinforced concrete buildings. Bridges and retaining walls of heavy section in moderate exposure.

[4]Suitable for mass concrete, basement walls, etc., protected from water or severe weather conditions.

These water-cement ratios are the maximum permissible. The mixes shall be proportioned for somewhat lower ratios so that with the normal fluctuations from batch-to-batch these ratios will not be exceeded. Moisture held by the aggregate must be included in computing the water-cement ratios. Water absorbed by the aggregate in a period of 30 minutes may be deducted in computing the water-cement ratio.

Change of Water-Cement Ratio—The water-cement ratios specified shall not be changed except by the Engineer. In the event that the Engineer finds it necessary to change the water-cement ratios from those specified, adjustment covering amount of cement and aggregates affected will be made as an extra or a credit under the provisions of the contract.

Measuring Moisture in the Aggregate—Moisture in the aggregate shall be measured by a method satisfactory to the

Continued on next page

Engineer, which will give results within 1 lb. for each 100 lb. of aggregate.

Concrete Consistency—The proportions of aggregate to cement for concrete of the water-cement ratios specified shall be such as to produce concrete that can be puddled readily into the corners and angles of the form and around the reinforcement without excessive spading and without segregation or undue accumulation of water or laitance on the surface. In no case shall concrete be placed which shows a slump outside of the following limits:

Part of structure	Slump, inches	
	Minimum	Maximum
Caissons	1	4
Heavy walls, slabs, beams	3	7
Thin walls and columns	4	8
Pavements	1	3

Proportions of Aggregate—The proportion of fine and coarse aggregate shall be such that the ratio of the coarse to the fine shall not be less than—*nor more than—*nor shall the amount of coarse material be such as to produce harshness in placing or honeycombing in the structure. When forms are removed, the surface and corners of the members shall be smooth and sound throughout.

Note: *The following limits in the proportion of coarse to fine aggregate are suggested:

Maximum size of coarse aggregate, inches	Ratio of coarse to fine aggregate on basis of dry and rodded volumes	
	Minimum	Maximum
⅜	0.4	0.8
¾	0.6	1.5
1 and over	1.0	2.0

Control of Proportions—The methods of measuring materials shall be such that the proportion of water to cement can be closely controlled during the progress of the work and easily checked at any time by the Engineer or his representative. To avoid unnecessary or haphazard changes in consistency, the aggregates shall be obtained from a source which will insure uniform quality and grading during any single day's operation, and they shall be delivered to the work and handled in such a manner that variations in moisture content will not interfere with the steady production of concrete of a reasonable degree of uniformity.

Tests of Concrete—Frequent tests may be made by the Engineer throughout the work to determine the quality of concrete. These tests will be made at the expense of the owner, and will, in general, be made on 6 by 12-in. concrete cylinders loaded in compression at 7 and 28 days, in accordance with the Standard Method of Making and Storing Specimens of Concrete in the Field (Serial Designation: C31-21) of the American Society for Testing Materials.

Co-operation of Contractor—The contractor shall co-operate in every way to the end that concrete of the desired quality be obtained. He shall provide, at cost, such housing as may be required for testing equipment and storage of test specimens; such cost to include only labor and materials actually used.

Mixing Concrete—The concrete shall be thoroughly mixed in a batch mixer of approved type. The mixer shall be equipped with suitable charging hopper. A water-storage and water-measuring device shall be provided. The mixing of each batch shall continue for at least one minute after all the materials are in the mixer during which time the mixer shall rotate at a peripheral speed of approximately 200 ft. per minute.

Depositing Concrete—Concrete shall be handled from the mixer to place as rapidly as practicable and in a manner that will prevent segregation of the ingredients. It shall be deposited in the forms as nearly as practicable in its final position to avoid rehandling. Concrete as it is deposited shall be puddled with suitable tools until forms are completely filled and reinforcement and embedded fixtures thoroughly incorporated in the mass.

Concrete shall be deposited continuously and as rapidly as practicable until the unit of operation, approved by the Engineer, is completed.

Concrete when deposited shall have a temperature of not less than 40° F. and not more than 120° F. In freezing weather suitable means shall be provided for maintaining the concrete at a temperature of at least 50° F. for 72 hours or more after placing, or until the concrete has thoroughly hardened. The methods of heating the materials and protecting the concrete shall be approved by the Engineer. Salt, chemicals, or other foreign materials shall not be mixed with the concrete for the purpose of preventing freezing.

Protection of Concrete—Exposed surfaces of concrete shall be protected from drying for a period of at least 7 days after being deposited.

High Early Strength Concrete

The element of time is often important in concrete work. Certain operations such as repairing cuts in pavement slabs, made necessary by water or sewer construction, require high early strengths in the concrete. Portland cement meeting standard specifications will produce concrete of the desired strength by variation in the quantity and proportions of the materials, including the water, and by adjusting the methods of placing and curing to the needs of the work under consideration.

The table shows the increase in strength that results from reducing quantity of mixing water and corresponding increase in quantity of cement to maintain same consistency. With some cements the use of 2 lb. of flake calcium chloride with each sack will add further to early strength. This should not be depended upon unless proven by test that the given cement will react in this manner.

Increasing the mixing time to 2 minutes will add about 100 lb. per sq. in. to the strength of all mixes at 3 days and 5 minutes mixing will add 200 lb. per sq. in. The factors which will increase strength at early ages are:

(1) Decrease amount of mixing water,
(2) Increase mixing time up to 5 minutes,
(3) Increase amount of cement,
(4) Place and keep concrete at 70° F. or higher,
(5) Keep concrete damp,
(6) Use calcium chloride where tests show favorable results.

TABLE OF BASIC MIXTURES

Based on 70° F. minimum temperature of concrete when placed and during curing and a minimum time of mixing of 1 minute

Refer. No.	Typical mixes (illustrating range for aggregates used in this test)		Water-cement ratio, (gal. per sack)	Slump in.	Compressive strength (cured wet until test)			
	Mix	Cement, (bbl. per cu. yd.)			1 da.	3 da.	7 da.	28 da.
1	1:2:3½	1.40	7½	6-7	100	500	1100	2000
2	1:2:3½	1.40	6½	2-4	230	830	1530	2600
3	1:2:3½	1.40	6	½	300	1000	1800	3000
4	1:1½:3	1.65	6	6-7	300	1000	1800	3000
5	1:1½:3	1.65	5½	2-4	370	1230	2070	3400
6	1:1½:3	1.65	5	½	470	1500	2400	3900
7	1:1:2	2.25	5	6-7	470	1500	2400	3900
8	1:1:2	2.25	4½	2-4	600	1800	2800	4300
9	1:1:2	2.25	4	½	830	2130	3170	4900

Note: In calculating water-cement ratio, free water or moisture carried by aggregates must be included; water absorbed by dry aggregates may be deducted. Slumps, mixes and cement quantities given above are for illustration only and are accurate only for the particular aggregates used in these tests.

Concrete Floor Finish

The installation of concrete floor finishes should be entrusted only to the competent floor contractor where uniformly hard, dense and durable surfaces are desired. The variables that make up a job must be constantly controlled to get satisfactory results. Aggregates must be chosen with regard to gradation, cleanness and hardness. Mixing water must be reduced to a minimum to produce the strongest concrete. Curing with plenty of water is absolutely necessary. Faulty and excessive troweling must be eliminated. These are the fundamental principles of good floor finish. If they are ignored, soft, porous, short-lived floors will usually

Continued on next page

result. Sloppy, soupy concrete, fine grained aggregates, improper troweling and total omission of proper curing account for practically all floor troubles.

Specification for 1-inch Bonded (Two Course) Concrete Floor Finish for an Office Building

Slab Level—The structural slab surfaces shall be reasonably true and struck off at a level approximately 1 in. below the finished floor level.

Brooming—As soon as the concrete base permits, all laitance, scum, dirt and loose aggregate shall be removed from the surface by means of a steel broom. Smearing of concrete indicates that it is still too soft. Brooming shall leave the surface clean and rough to insure thorough bond of finish.

Chipping—When it is impossible to cut off laitance and roughen the slab prior to the final set of the cement, the surface shall be cleaned and prepared for bond by mechanical chipping.

Grouting—The slab shall be thoroughly wet, but free from pools of water. A thin coat of neat cement grout shall be thoroughly broomed into the surface of the slab just prior to the application of the wearing course.

Mix—The mix shall be 1 part of portland cement, 1 part of coarse, clean, torpedo sand, and 1½ parts of hard, clean pea gravel or crushed stone (¼ to ½ in.).

Consistency—The concrete shall be of the driest consistency possible to work with a sawing motion of the strike-off board.

Finishing—After striking off the wearing course to the established grade, it shall be compacted with a wood float. From time to time, the surface shall be tested with a straightedge to prevent high and low spots. The concrete shall be floated so as to yield a surface free from depressions or irregularities of any kind. This floating shall be followed by steel troweling to bring the finish to a smooth surface free from marks and blemishes. In no case shall dry cement or a mixture of dry cement and sand be sprinkled on the surface of the wearing course to absorb moisture or to hasten the hardening.

Curing—Within 24 to 36 hours after the final troweling, the finished surface shall be covered with a layer of sand or sawdust which shall be kept wet by sprinkling with water for at least 10 days.

SPECIFICATIONS FOR CONCRETE BUILDING BLOCK AND CONCRETE BUILDING TILE

I. General

(1) The purpose of these specifications is to define the requirements for concrete building block and concrete building tile to be used in construction.

(2) The word "concrete" shall be understood to mean Portland cement concrete.

II. Classification

(3) According to the strength in compression 28 days after being manufactured or when shipped, concrete block and concrete tile shall be classified as heavy load bearing, load bearing, and non-load bearing on the basis of the following requirements:

Name of classification	Compressive strength, lb. per sq. in. of gross cross-sectional area as laid in the wall	
	Aver. of 3 or more units	Min. for individual unit
Heavy load bearing block or tile...	1200	1000
Medium load bearing block or tile..	700	600
Non-load bearing block or tile.....	250	200

(4) The gross cross-sectional area of a one-piece concrete block or tile shall be considered as the product of the length times the width of the unit as laid in the wall. No allowance shall be made for air spaces in hollow units. The gross cross-sectional area of each unit of a two-piece block or tile shall be considered the product of the length of the unit times one-half the thickness of the wall for which the two-piece block or tile is intended.

III. Requirements

(5) The compressive strength of the concrete in units of all classifications except "non-load bearing block" shall be at least 1000 lb. per sq. in., when calculated on the minimum cross-sectional area in bearing.

(6) Concrete building block and tile to be exposed to soil or weather in the finished work (without stucco, plaster or other suitable protective covering) shall meet the requirements of the absorption test.

(7) All concrete building block and tile not covered by Paragraph 6 need not meet an absorption requirement.

(8) Concrete block and tile shall not absorb more than 10 per cent of the dry weight of the unit when tested as hereinafter specified, except when it is made of concrete weighing less than 140 lb. per cu. ft. For block or tile made with concrete weighing less than 140 lb. per cu. ft. the absorption in per cent by weight shall not be more than 10 multiplied by 140 and divided by the unit weight in pounds per cubic foot of the concrete under consideration.

(9) Specimens for tests shall be representative of the commercial product of the plant.

(10) Not less than three and preferably five specimens shall be required for each test.

(11) The specimens used in the absorption test may be used for the strength test provided they have been dried at approximately 70 degrees Fahrenheit for not less than three days.

CONDENSED SPECIFICATIONS FOR PORTLAND CEMENT STUCCO

General

Preparation of Backing Surface—The backing surface of whatever type, shall provide clean, rough surfaces and good mechanical bond for the stucco, and shall be thoroughly cleaned before the application of stucco; all hangers, fasteners, trim or other fixed supports, or projections of any kind, shall be in place before stucco is applied. Masonry walls shall be properly wetted before the application of the scratch coat. Flashing shall be applied at all points where it would prevent water from getting behind the stucco.

Materials

Cement—Portland cement shall conform to the requirements of the latest standard specifications of the American Society for Testing Materials.

Fine Aggregate—Fine aggregate shall consist of clean sand, or screenings from crushed stone or pebbles, graded from fine to coarse, passing when dry a No. 8 screen, free from dust or other deleterious materials.

Water—Water shall be clean, free from oil, acid, strong alkali or vegetable matter.

Coloring Materials—Only permanent mineral oxides that are fully guaranteed by the manufacturer to be unaffected by lime, cement or weather, and in amounts not to exceed 10 per cent of the weight of the cement shall be used as coloring matter.

Hydrated Lime—Hydrated lime shall meet the requirements of the standard specifications of the American Society for Testing Materials and shall be used in quantity not to exceed one-fifth the volume of cement.

Construction

Proportions—The proportions for all coats shall be 1 bag of cement to 3 cu. ft. of sand to which may be added hydrated lime in an amount not exceeding one-fifth the volume of cement. In these proportions 1 cu. ft. (1 bag) of cement weighs 94 lb. net and 1 cu. ft. of hydrated lime weighs 40 lb.

Mixing—The ingredients of the stucco shall be thoroughly mixed, preferably in a machine mixer of the rotating drum type, for at least five minutes after all materials are in the drum. The quantity of water shall be determined by trial and thereafter measured in proper proportion.

Masonry Walls—Concrete, concrete block, brick, hollow tile and similar walls shall be rigid and constructed upon solid footings, all units being set in portland cement mortar. The surface on which stucco is to be applied shall be clean, free from all dust, dirt or loose particles, preferably rough and of coarse texture. Wood lintels over wall openings shall not be used. Monolithic concrete walls shall be roughened by hacking, wire brushing or other effective means. Concrete block, tile or brick units shall have the joints cut back even with the surface.

Continued on next page

Framing—Spacing of studs shall not exceed 16 in. Studding shall run from foundation to rafters without intervening horizontal members, tied together below second floor joists with 1x4-in. boards let into the inner faces of the studs. In open construction without sheathing, the spacing of studs shall not exceed 12 in. The corners of all walls shall be braced diagonally to secure the necessary rigidity of the structure. Bridging of studding with 2x4-in. braces shall occur at least once in each story height.

Sheathing—Sheathing boards shall not be less than 6 in nor more than 8 in. wide, dressed to a uniform thickness, laid horizontally and fastened securely to each stud. Over the sheathing shall be laid, horizontally, beginning at the bottom, any standard asphalt saturated roofing felt weighing 15 lb. per square, the bottom layer lapping the baseboard and each strip lapping the strip below and all flashing at least 2 in.

Application of Reinforcement—Reinforcement shall be placed horizontally, fastened with approved furring devices not more than 8 in. apart over the surface. Vertical laps shall occur at supports, horizontal joints being lapped and tightly laced with 18 gauge annealed wire. The sheets shall be returned around corners at least 4 in. in sheathed construction and 16 in. in open construction. Corner beads shall not be used.

Furring—All reinforcement shall be furred out from the studs, sheathing or base ⅜ in. by any device which will not reduce the effective section of the scratch coat.

Half-timbering—Embedded trim or half-timbering shall be securely nailed directly upon sheathing or studs, and shall have the inside corners of vertical members grooved into which the mortar of the first coat shall be forced forming a watertight joint. All joints on horizontal members shall be flashed.

Application of Stucco Coats on Frame Construction—The application shall be carried on continuously in one general direction without allowing the stucco to dry at the edges. If it is impossible to work the full width of the wall at one time the joining shall be at some natural division of the surface, such as a window or door. The scratch coat shall be shoved thoroughly through the metal reinforcement forming a solid mass against the sheathing paper, thus completely encasing the metal. This coat shall be ½ in. thick fully covering the face of the reinforcement and shall have its surface heavily cross scratched to provide a strong mechanical key or bond. Allow this coat to become thoroughly dry. It shall be wet down but not saturated before applying the second coat. The second or browning coat shall be at least ½ in. thick over the face of the first coat and shall be rodded straight and true in every direction, or left untrue giving a wavy effect, as the desired finish would suggest. If the finish is to be a float type finish, the second coat shall be brought to a good even surface with wood floats. This coat shall be wet down for at least three days and allowed to become thoroughly dry before the finishing coat is applied. The finish coat shall be applied not less than one week after the application of the second coat and shall vary in thickness from ⅛ to ¼ in., depending upon the texture of the finish coat.

Scratch Coat on Masonry Walls—Mortar shall be troweled on to a thickness of approximately ½ in., heavily cross scratched and allowed to become thoroughly dry before the browning coat is applied.

(From this point on use specification covering "Application of Stucco Coats on Frame Construction.")

Freezing—Stucco shall not be applied when the temperature is below 32° F., unless protected with canvas and heat sufficient to prevent freezing for a period of at least 48 hours after application.

Curing—Each coat shall be protected from drying rapidly from effects of intense sunlight or wind until it has sufficiently hardened to permit sprinkling. Each coat shall be kept moist by sprinkling for at least three days following its application.

COLOR DECORATION ON CONCRETE

Concrete surfaces are eminently suited for expressing directly, motifs in any color combinations known to the artist. Oil stains give a wide range of color without affecting the characteristic texture of the concrete. Craftsmen have found that the roughness and board markings serve to enhance the decorative effect. Such concrete surfaces possess a tone and atmosphere both unique and pleasing.

Color decoration applied directly to the concrete surface is extensively used on ceilings and is a natural development for the beam and girder type of construction. Many examples have shown that once applied the design may be protected by suitable coatings over a long period of years, lending a desirable permanency so difficult to attain with other media.

Many wall surfaces of concrete have also been treated in this manner. Color decoration on monolithic walls combined with modeling in low relief, offers possibilities in wall embellishment expressive of the material. This type of decoration is well within the usual economic limits since it eliminates certain operations that add to the cost of other forms of ornamentation.

Specifications for Painting Concrete

Cleaning—All loose particles and dirt shall be removed. Grease or oil shall be wiped off with a rag saturated with gasoline or benzine. Surfaces previously coated shall be either sandblasted, or wire brushed.

Neutralization of Surface—The cleaned surface shall be brushed with a water solution containing 4 lb. of zinc sulphate to the gallon. At least 48 hours shall be allowed for the zinc sulphate to react and dry.

Staining—Staining shall be done by using any good linseed oil paint thinned to the proper consistency with turpentine. Stains only differ from paints by containing enough volatile solvent to make up about one-half by volume of the vehicle.

Painting—For one-coat work the paint shall be applied without thinning. For two-coat work the first coat shall be thinned with the proper solvent (turpentine or naphtha, 1 pt. to the gallon). The second coat shall be applied without thinning. At least 48 hours drying time shall be allowed between coats.

CAST STONE

Cast stone is one form of concrete used as an exterior facing material to give beauty and grace to buildings.

The ease with which it may be moulded so as to conform to architectural requirements gives cast stone an especially practical value as a building material. The demand for color in architecture can be fully satisfied through the use of colored aggregate or color pigments in cast stone, while the range of textures goes even beyond what is possible in natural stone.

The growing list of monumental buildings employing cast stone is evidence of its merit.

CONCRETE FLOORS AND FLOOR COVERINGS

Concrete floors in residences confine basement fires to their origin, add rigidity and stability to the structure, eliminate vibration and sagging, and minimize plaster cracking. Are serviceable, smooth and sanitary.

They provide a smooth, rigid and durable base upon which to place any selected floor covering. Linoleum, cork or rubber may be cemented directly to the concrete, and hardwood flooring may be nailed to sleepers embedded in the concrete or secured with metal clips. Parquet and design floors may be cemented directly by means of a mastic cement. Slate, art marble, concrete and ceramic tile may be laid in cement mortar over the concrete floor.

Types of concrete floors in general use are the solid slab, ribbed and tile and joist.

THE SANDUSKY CEMENT COMPANY

Manufacturer of Medusa Portland Cements

CLEVELAND, OHIO

PLANTS

CINCINNATI, OHIO, Builders Industries Building
CHICAGO, ILL., 1016 The Builders Building
NEW YORK, N. Y., 350 Madison Avenue
TOLEDO, OHIO, 1004 Second National Bank Building
YORK, PA., 60 Lehmayer Building

FACTORIES

Products

MEDUSA PORTLAND CEMENTS.

For Medusa Waterproofing, see page A101; for Medusa Portland Cement Paint, see page B2131.

Output

Annual production = over 4,000,000 bbls.

Quality

Medusa Portland Cements are guaranteed to pass all standard and U. S. Government specifications. Every carload is tested before being shipped. A record of laboratory tests furnished on request.

Literature

New Medusa literature, in standard size 8½x11 in., describing many of the uses for Medusa White Cement will be gladly sent at your request.

The Use and Some of the Many Applications of Medusa White Portland Cement — Waterproofed or Plain

Irrespective of type or kind of structure, Medusa White Portland Cement will fit in perfectly at several points in the construction. Any concrete work when the element of appearance is as vital and important as the permanence of the material itself, should be done in either Waterproofed or Plain Medusa White Portland Cement.

One handles and mixes Medusa White Portland Cement exactly the same as ordinary gray cement. Special attention must be given to the sand and aggregates used in the producing of different tints or shades. Various mineral oxides can be used with Medusa White Portland Cement to produce color effects.

Due to the whiteness of Medusa White Cement, it is especially desirable where light shades of color are required.

A Remarkable Illustration of the Possibilities in Architectural Embellishment of Precast Work Using Medusa White Cement, on the Estate of John Bindley, Cocoanut Grove, Fla.

KIEHNEL & ELLIOTT of Pittsburgh and Miami, Architects
All ornamentation shown was done under the able execution of JOHN B. ORR of Miami

There is no waterproofed white cement except Medusa Waterproofed White Cement. We are the exclusive manufacturers of this product.

The illustrations show some of the practical, unique and enduring effects that can be secured in exterior work, and the specifications show definitely how any given effects may be produced.

Partial List of Leading Applications for Medusa White Portland Cement—

Cast stone (plain or ornamental)
Cut cast stone (plain or ornamental)
Cement brick
Cement floor tile
Cement mantels
Concrete block facing
Concrete blocks
Concrete burial vaults
Concrete fence posts
Concrete roofing tile
Concrete stave silos
Hollow concrete tile
Lawn furniture

Monuments
Mortar
Ornamental cement work
Shower baths
Stucco
Swimming pools
Table tops and counters
Terrazzo tile
Traffic markers

Description of Medusa Portland Cements

Medusa Portland Cements attain high strength rapidly; they are absolutely uniform, unsurpassed in fineness and strength.

Medusa White Portland Cement—Is perfectly white and non-staining; a product of unlimited artistic possibilities. It differs from ordinary gray cement in color and fineness only. Where ordinary portland cement is a varying shade of gray, Medusa White Cement is a uniformly clean white. This is true in the finished work as well as in the sack. It passes all the requirements of the American Society for Testing Materials. Furnished either plain or waterproofed.

Medusa Gray Portland Cement—Is uniform in color and passes all the requirements of the American Society for Testing Materials. Furnished either plain or waterproofed.

Medusa Waterproofed Cements are our regular gray and white brands, waterproofed with our celebrated Medusa Waterproofing (see our pages in Waterproofing Section), and ready for use.

Continued on next page

Vital Points to be Observed Carefully in Concrete Work

Use the proper proportions for the work intended.

Cement—The most important materials used in concrete work are cement and water.

The cement used in mass concrete or the facing of concrete work should be either Medusa White Portland Cement or Medusa Waterproofed White Portland Cement.

The gray portland cement should be either Medusa Gray Portland Cement or Medusa Waterproofed Gray Portland Cement. (In locations where it is impossible to obtain Medusa Waterproofed Gray Cement any standard gray portland cement passing the requirements of the U. S. Government may be used with the addition of the proper amount of Medusa Waterproofing.) *See our pages in Waterproofing Section.*

Storage of Cement—All cement should be stored in a weathertight, dry building to prevent caking.

Water—Water for concrete or cement work must be clean, free from oil, acid, strong alkali or vegetable matter and should be good enough to drink. Do not use an excess of water in mixing, as it will ruin the work by causing sand and stone pockets and wash away the cement, reducing the strength of concrete and causing cement work to dust and disintegrate.

Best results are obtained by making the mixture of a plastic or jellylike consistency, so as to flow readily into the forms with slight spading.

If applying cement plaster to a base which is in the least porous—such as tile, brick, old concrete walls, floors, etc.—the base must be thoroughly soaked with water before applying. Otherwise water will be drawn out of the fresh cement plaster before it has a chance to set properly and the results will be a failure.

Fine Aggregates—Sand that looks and feels good in the palm of the hand should not be accepted without further tests for quality, grading and voids.

Quality—There are numerous sands that are not wholly decomposed and will crush under pressure of the fingers. Under microscopic examination such sands will show a small crystal surrounded by a soft honeycombed wall; when used in concrete, it would break down the cementation value of the cement and result in weak, mealy concrete. Fine silica sands are often found to be matted together and should be broken up before using.

Grading—All sands should be frequently tested by thoroughly drying and running through at least three screens—⅛ in., 24 and 40.

Sand should be clean, free from clay, loam or vegetable matter. It should be graded so that all will pass a ⅛-in. mesh, one-third remaining on a No. 24 screen, one-third on a No. 40, and one-third on a No. 60. (It is rare to find a sand with such an exact grading—the above figures are given as a standard. The closer they are approached the better the final results.) The following actual sieve tests are examples of ideal sands for use in any concrete work:

3%	through ¼-in.	mesh, held on ⅛-in. mesh
20%	through ⅛-in.	mesh, held on $\frac{1}{16}$-in. mesh
35%—12%	through $\frac{1}{16}$-in.	mesh, held on No. 24 mesh
17%	through No. 24	mesh, held on No. 30 mesh
35%—18%	through No. 30	mesh, held on No. 40 mesh
22%	through No. 40	mesh, held on No. 60 mesh
5%	through No. 60	mesh, held on No. 80 mesh
2%	through No. 80	mesh, held on No. 100 mesh
30%— 1%	through No. 100	mesh

Damp sands are misleading; the coarse will attract the minute particles, appearing apparently perfect, when in reality they are excessive in fines and dangerous.

Coarse Aggregates—Equal care is necessary in the use of the larger aggregates. Bank run should never be used before ascertaining the percentage of coarse and fine material and proportioning accordingly.

Gravel and pebbles will produce more dense concrete; trap rock and silica sand the greatest strength.

Trap rock, gravel and silica sand produce strength and density. Crushed granite or hard trap rock requires more sand.

For soft trap rock, presenting rounded corners, use less sand. It is dangerous to use the crusher run of any aggregate before screening. Dust in excess of 15% through a 60-mesh screen should never be used.

Colorimetric Test—A simple, practical test to determine the presence of rotten vegetable or organic matter in sand, pebbles or broken stone, is made as follows:

Take a 12-oz. bottle. Fill to 4½-oz. mark with material to be tested. Then pour in a 3% solution of caustic soda until the volume of sand and solution after shaking amounts to 7 oz. Thoroughly shake the bottle and contents and allow to stand for 24 hours. If, at the end of this time, the liquid above the material is colorless, or only a light yellow, it is sufficiently free of organic matter to be used, provided its other qualities are suitable.

If the liquid is darker than a light yellow, approaching a brownish yellow. the material may be used for unimportant concrete work. It should not be used in first class concrete work. If the liquid is a dark brown the material should be washed or rejected.

Cause of Crazing, Hair Cracks, or Map Checks

The appearance of hair cracks or crazing in concrete or cement work results from greater shrinkage in the rich, wet surface than in the body of the work and can be prevented by keeping the work *covered, moist and protected from the sun and wind,* for a period from one to four weeks, according to weather and character of the work.

Hair cracks or crazing generally may be traced to any or all of the following conditions:

(1) Mixture too rich in cement.
(2) Too much water used in mixing.
(3) Too rapid drying out.
(4) Too fine sand or aggregate.

Mixture Too Rich in Cement—Neat cement when set and hardened in air contracts much more than when mixed with sand or other inert aggregate, this contraction increasing with age up to a certain period. When allowed to harden and set under water, contraction is very much less than in air, but is still present to a slight extent. With a fair proportion of sand, finely crushed stone or other suitable aggregate, the contraction is reduced to practically zero and there is no tendency for cracks to form, provided surface is protected and kept moist. As a rule, the ratio of cement to inert material should not be greater than 1 to 2.

Too Much Water Used in Mixing—When the right quantity of water is used in mixing concrete, a soft plastic mass is formed with just sufficient water to bind the cement, sand, etc., together and to remain in the mass itself with no tendency to escape or flow away.

Water also serves as a vehicle to carry the cement and finer particles of sand into the spaces between the larger pieces of gravel, stone, etc., and to distribute the component parts uniformly throughout the mass.

An excess of water will run off or rise to the surface of the concrete, carrying with it much of the cement in suspension and rob the interior of its cementing material. As the surface water evaporates, the fine cement is deposited as a layer of practically neat cement which, as stated above, has a greater tendency to contract than the poorer mixture beneath. This is the most fruitful cause of hair cracks.

Too Rapid Drying Out—Where ample precautions are taken to protect fresh concrete or cement work from drying out, by means of thick layers of wet sand, or wet cloths hung over vertical faces, and this protection is kept up for a week or more, very few if any hair cracks occur.

Neat cement or very rich mixtures which will craze when hardened in the air will show no such effect if kept under water. Therefore there is less chance for contraction when the concrete or cement is not allowed to dry out; and the prevention of contraction prevents also the tendency to crack or check on the surface.

Too Fine Sand or Aggregate—Insufficient coarse material in concrete, stucco, etc., to hold the cement and fine sand, will increase the danger of the sand and cement being washed to the surface. The same result will be obtained as where an excess of water is used.

Few contractors and users of cement realize the importance of a properly graded mixture and the practical necessity of having sufficient coarse particles, whether pebbles or fragments of crushed rock, present for the greatest strength and best results.

One of the most successful manufacturers of cast stone in Ohio attributes his freedom from hair crack trouble to care in selecting and grading his aggregates.

With attention to the above four points, we are confident that any careful user of cement can reduce hair crack and crazing trouble to a minimum, or prevent it altogether.

Specifications for Waterproofed Portland Cement Stucco

Materials—***Cement***—The cement for the first coat (base or scratch coat) shall be standard gray portland cement conforming to the Specifications of the American Society for Testing Materials, with the addition of Medusa Waterproofing Powder or Paste, to the amount of 2% by weight of the cement used (2 lbs. to the sack of cement).

The cement for the second or brown coat, and the third or finish coat, shall be Medusa Waterproofed White Portland Cement.

Fine Aggregate—Fine aggregate shall consist of sand, screenings from crushed stone, or crushed pebbles, evenly graded from fine to coarse, passing when dry a No. 8 screen. Fine aggregates should preferably be of silicious materials, clean, coarse and free from loam, vegetable or other deleterious matter.

Hydrated Lime—Hydrated lime shall meet the requirements of the standard specifications for hydrated lime of the American Society for Testing Materials, being used to add plasticity to the mixture.

Coloring Matter—Only permanent, mineral oxides and limeproof colors shall be used. Finish coat containing colors shall be applied as dry as possible to prevent separation of the colors. (The use of Medusa Waterproofed Cement will prevent the gradual washing out of a color surface).

Water—Water shall be clean, free from oil, acid, strong alkali or vegetable matter.

Preparation of Mortar—***Mixing***—The ingredients of the mortar shall be mixed until thoroughly distributed and the mass is uniform in color and homogeneous. The quantity of water necessary for the desired consistency should be determined by trial, and thereafter measured in proper proportion. The water shall be added slowly to the dry mix so as to allow the aggregates to absorb as much as possible in the course of mixing.

Machine Mixing—The mortar shall preferably be mixed in a suitable mortar-mixing machine of the rotating drum type. The period of machine mixing shall be not less than 5 minutes after all the ingredients are introduced into the mixer.

Hand Mixing—The mixing shall be done in a watertight mortar box, and the ingredients shall be mixed dry until the mass is uniform in color and homogeneous. The proper amount of water shall then be added and the mixing continued until the consistency is uniform.

Measuring Proportions—Methods of measurement of the proportions of water shall be used which will secure separate uniform measurements at all times. All proportions stated shall be by volume. A bag of cement (94 lbs. net) may be assumed to contain 1 cu. ft.; 40 lbs. may be assumed as the weight of 1 cu. ft. of hydrated lime. Hydrated lime shall be measured dry, and shall *not* be measured nor added to the mortar in the form of putty.

Retempering—Mortar which has begun to stiffen or take its initial set shall not be used.

Consistency—Only sufficient water shall be used to produce a good workable consistency. The less water in the mix, the better the quality of the mortar, within working limits.

Mortar Coats—***Mortar***—All coats shall contain not less than 3 cu. ft. of fine aggregate to 1 sack of portland cement.

Application—The plastering shall be applied with a steel trowel and carried on continually in one general direction without allowing the plaster to dry at the edge. If it is impossible to work the full width of the wall at one time, the joining shall be at some natural division of the surface, such as a window or door. The first coat shall thoroughly cover the base on which it is applied and shall be troweled enough to insure the best obtainable bond. Before the coat has set it shall be heavily cross-scratched with a saw-toothed metal paddle or other suitable device to provide a strong mechanical key.

The first coat shall be thoroughly wet down before the second coat is applied The second coat shall be applied, whenever possible, on the day following the application of the scratch coat, and shall be brought to a true and even surface by screeding at intervals not exceeding 5′ 0″, and by constant use of a straight-edge. When the second coat has stiffened sufficiently, it shall be floated with a wood float and lightly and evenly cross-scratched to form a good mechanical bond for the finish coat. The day following the application of the second coat, and for not less than 3 days thereafter, the stucco must be thoroughly sprayed at frequent intervals and kept from drying out. The finish coat shall be applied not less than a week after the application of the second coat. Methods of application will hereinafter be described under "Finish."

Drying Out—*The finish coat must not be permitted to dry out rapidly and adequate precaution must be taken to make this certain by sprinkling frequently after the mortar is set hard enough to permit it, or by hanging wet burlap or similar material over the surface, during hot weather.*

Freezing—Stucco should not be applied when the temperature is below 32° Fahr., nor under any conditions such that ice or frost may form on the surface of the wall.

Stains—Dirt may be readily washed off Medusa Waterproofed White Portland Cement stucco by using a brush and Sapolio, or other cleaning compound.

Mortar Colors—Should not be used to color Portland cement stucco, use only mineral oxides.

Use of Medusa White Waterproofed Portland Cement for Non-staining Mortar

Setting and backing up marble and stone work, and laying face brickwork requires a mortar that will not discolor the face of the marble, stone or face brick.

Medusa Stainless White Cement contains only a trace of iron. Due to this purity of composition it will not streak or stain the finest of building materials. It is used extensively from coast to coast, on the finest of buildings for this purpose.

Specifications

Mortar for Marble or Stone Work

For setting, backing and pointing marble and stone work.

Non-staining Waterproofed Cement—Cement shall be Medusa Waterproofed White (Non-staining) Portland Cement, manufactured by The Sandusky Cement Company, Cleveland; or other approved white (non-staining) portland cement conforming with the requirements of the American Society for Testing Materials, and guaranteed by the manufacturer to contain 20% or more of water-repellents, ground in with the cement during process of manufacture at the mill.

Waterproofing mixed with a non-staining cement by hand or machine, at the job or elsewhere, will not be permitted to be used.

Sand—Sand shall be clean river, lake or bank sand, light in color and evenly graded from fine to coarse, all passing through a ⅛"-mesh sieve, with voids not in excess of 35% by water after thoroughly drying.

Crushed Marble for Pointing—Crushed white marble for pointing mortar shall be equal to Conlin Marble Company's, Tuckahoe, N. Y., size 20 to 30.

Measuring—Assuming that 1 bag of portland cement measures 1 cu. ft., other aggregates are to be measured accordingly by the use of a bottomless box that holds 1 cu. ft. *The measuring of sand or other material with a shovel will not be permitted.*

Water—Water in all cases shall be added slowly and only sufficient water used to reach a stiff, workable consistency.

Setting Mortar—Mortar for the setting and backing of marble and stone work shall consist of:

1 part Medusa Waterproofed White Portland Cement.
⅛ part hydrated lime, by volume.
3 to 4 parts sand.

Pointing Mortar—Mortar for pointing of marble shall consist of:

1 part Medusa Waterproofed White Portland Cement.
⅛ part hydrated lime, by volume.
2 to 3 parts white crushed marble or sand.

Setting of Marble or Stone—All marble or stone work shall be sufficiently embedded and backplastered in the mortar to form one continuous coating. Special attention must be given to all belt courses, copings and other exposed surfaces.

Mortar for Laying Face Brick

Note: The object of using Medusa Waterproofed Cement is to overcome discoloration, dampness and efflorescence.

Non-staining Waterproofed Cement—Cement shall be Medusa Waterproofed White (Non-staining) Portland Cement, manufactured by The Sandusky Cement Company, Cleveland; or other approved white (non-staining) portland cement conforming with the requirements of the American Society for Testing Materials, and guaranteed by the manufacturers to contain 20% or more of water-repellents, ground in with the cement during process of manufacture at the mill.

Waterproofing mixed with a non-staining cement by hand or machine at the job or elsewhere, will not be permitted to be used.

Sand—Sand shall be clean river, lake or bank sand, light in color and evenly graded from fine to coarse, all passing through a ⅛"-mesh sieve, with voids not in excess of 35% by water after thoroughly drying.

Water—Water in all cases shall be added slowly and only sufficient water used to reach a stiff, workable consistency.

Measuring—Assuming that 1 bag of portland cement contains 1 cu. ft., other aggregates are to be measured accordingly by the use of a bottomless box that holds 1 cu. ft. *The measuring of sand or other material with a shovel or other implement that has no positive dimensions will not be allowed.*

Setting Mortar—Mortar for laying face brick shall consist of:

1 part Medusa Waterproofed White Portland Cement.
⅛ part hydrated lime, by volume.
3 parts sand.

Joints—Should a joint exceeding ⅝" be desired, the necessary amount of coarse grit may be added to the above mortar.

Mixing—When mortar is hand mixed, dampen the sand to a damp earth consistency, add Medusa Waterproofed Cement and hydrated lime, and mix as usual. When sand, Medusa Waterproofed Cement and lime are uniformly mixed add only enough water to secure proper consistency.

When a batch mortar mixing machine is used, dampen the sand and put into the mixer with the Medusa Waterproofed Cement and hydrated lime; allow mixer to run until cement, sand and lime are uniformly mixed. Then add only enough water to secure proper consistency.

Mortar for Laying Exterior Common Brick Walls

Notes: The object of using Medusa Waterproofing Powder or Paste is to prevent efflorescence, dampness and discoloration of the face brick or the exterior face of the brick wall.

See our pages in Waterproofing Section describing Medusa Waterproofing, Powder and Paste.

Cement—All cement shall be an approved brand of portland cement conforming with the requirements of the American Society for Testing Materials.

Sand—All sand shall be clean bank sand, light in color and evenly graded from fine to coarse, all passing through a ⅛"-mesh sieve, with voids not in excess of 35% by water after thoroughly drying.

Waterproofing Powder (or Paste)—All waterproofing shall be Medusa Waterproofing Powder (or Paste) mixed according to the directions of the manufacturers or their representatives.

Water—Water in all cases must be added slowly and only sufficient water used to reach a stiff, workable consistency.

Note: If Medusa Waterproofing Paste is to be used the above Water clause should be omitted.

Measuring—Assuming that 1 bag of cement contains 1 cu. ft., other aggregates are to be measured accordingly by the use of a bottomless box that holds 1 cu. ft. *The measuring of sand or other material with a shovel or other implement that has no positive dimensions will not be allowed.*

Setting Mortar—Mortar for laying exterior brick walls shall consist of:

1 part approved portland cement.
⅛ part hydrated lime, by volume.
3 parts sand.

(A) Medusa Waterproofing Powder shall be used in quantity equal to 2% by weight of the cement (8 lbs. to the barrel) thoroughly mixed with the dry cement, then in turn with the sand. All according to the directions of the manufacturers or their representatives.

Note: If Medusa Waterproofing Paste is used instead of powder, the following clause (B) should be used in place of clause (A).

(B) Medusa Waterproofing Paste shall be used as follows: 1 gal. (8 lbs.) of Medusa Paste shall be added to 20 gals. of water. This is sufficient to gauge 1 barrel of cement. All according to the directions of the manufacturers or their representatives.

Note: If Medusa Waterproofing Paste is to be used the above Water clause should be omitted.

Architectural Stone Made with Medusa Stainless White Portland Cement (Plain or Waterproofed)

No better grade of cement can be employed as the principal ingredient in manufacturing artificial architectural stone, such as cut cast stone and cast stone both plain, moulded and ornamental, than Medusa Stainless White Portland Cement (Plain or Waterproofed) especially due to its whiteness, which is permanent; its stainless qualities; and when Medusa Waterproofed White Portland Cement is used, the manufactured product becomes impervious to water and moisture.

Special attention must be given to the aggregates used to produce different results. This information we will gladly furnish at your request.

Buhl Building, DETROIT, MICH.

A post card to any of the above manufacturing companies will bring you full information about Super Cement

What Super Cement Is

SUPER CEMENT is a more efficient form of portland cement, producing concrete which is permanently waterproof, oilproof, and highly resistant to destructive agencies.

SUPER CEMENT is used instead of, and in exactly the same way as ordinary portland cement, and no special methods of handling are necessary.

SUPER CEMENT is always sold in bags carrying the registered trade-mark as reproduced on this page.

Advantages

SUPER CEMENT ensures smoothly working mortars and concretes without using admixtures; durable, dustless wearing surfaces without using hardeners; permanently waterproof, dampproof structures without supplementary membranes or applications; concrete that resists the attacks of frost, sulphur waters and other destructive agents without the aid of expensive treatments; denser, stronger and more uniform concrete, through absence of tendency to segregate in handling.

Specifications

Cement—

The cement to be used in all concrete shall be a tanno-catalysed portland cement marketed under the registered trade name SUPER CEMENT by its various manufacturers, and shall meet all test requirements of the current A.S.T.M. Standard for Portland Cement.

Aggregate—

Fine Aggregate—Fine aggregate shall consist of natural sand having clean, hard, strong, durable, uncoated grains, free from injurious amounts of dust, lumps, soft or flaky particles, shale, alkali, organic matter, loam, or other deleterious substances. The sand shall be of such sizes that it shall all pass a ⅜-in. sieve, at least 15 per cent shall be retained on the No. 8 sieve, and the fineness modulus shall not exceed 3.20.

Coarse Aggregate—Coarse aggregate shall consist of gravel, crushed stone, crushed air-cooled blast-furnace slag weighing not less than 70 lb. per cu. ft. or other approved inert materials, having clean, hard, strong, durable, uncoated particles free from injurious amounts of soft, friable, thin, elongated or laminated pieces, alkali, organic or other deleterious matter. Coarse aggregate shall not have more than 10 per cent finer than the No. 4 sieve and the maximum size shall not exceed —**.

Proportioning of Aggregate—Fine and coarse aggregates shall be proportioned in the field in such ratio as to obtain maximum weight per unit volume of combined aggregates.

Water—

Water for concrete shall be from the city water supply or other approved source. Total mixing water (including that contained in the aggregates) shall not exceed the following amounts for various types of concrete:

Class 1—3000 lb. 7 day—4¼ gal. per sack of cement.
Class 2—2000 lb. 7 day—5¾ gal. per sack of cement.
Class 3—3000 lb. 28 day—6 gal. per sack of cement.

Cement per Cubic Yard—

The amount of cement per cubic yard of concrete shall be determined by the requirements of workability, but unless specifically mentioned hereafter or specifically authorized by the engineer, shall in no case be less than the following:

All work below grade, and concrete exposed to the elements, not less than 7 sacks per cubic yard;

All other concrete not less than 6 sacks per cubic yard.

Workability—

The engineer shall be the sole judge of the degree of workability required for all concrete, and this quality shall be attained either by variation of the cement content plus the specified water per sack, or by variation of mixing time.

Mixing Time—

In no case shall time of continuous mixing after all materials including water are in the mixer, be less than one and one half (1½) minutes.

Temperature—

Concrete when deposited shall have a temperature of not less than 40° F. and not more than 120° F. In freezing weather suitable means shall be provided for maintaining the concrete at a temperature of at least 50° F. for 72 hours or more after placing, or until the concrete has thoroughly hardened. The methods of heating the materials and protecting the concrete shall be approved by the engineer. Salt, chemicals, or other foreign materials shall not be mixed with the concrete for the purpose of preventing freezing.

Special Specifications

Specifications for Super Cement—

Stucco, swimming pools, oil tanks, vats, floors, waterproofing, remedial waterproofing, etc., will be supplied on application.

**Maximum size to be filled in by the Engineer.

ADENSITE CO., INC.

Manufacturers of Concrete Waterproofing and Hardeners

116 West Thirty-ninth Street
NEW YORK, N. Y.

LABORATORY: 36-17 34th Street, LONG ISLAND CITY, N. Y.

Products

ADENSITE, a Liquid Integral which is used in the gauging water for Hardening and Waterproofing portland cement concrete and mortar.

PURTONE COLORS, mineral color in powder form for portland cement floor finish.

ADAFLINT, a flush-on floor hardener in crystal form.

A LIQUID INTEGRAL ADENSITE ITS FUNCTION GUARANTEED

TRADE-MARK

Adensite

Uses—Waterproofing concrete walls below grade, either in mass concrete or in plaster coat.

Hardening and dustproofing cement floor finish.

Waterproofing portland cement stucco.

For brick masonry, Adensite gauged mortar is smooth working, does not drag and prevents "riding."

Authoritative Tests—Upon request, we shall be pleased to furnish the architect with authoritative test data on Adensite, compiled from testing laboratory results and research work carried out at the U. S. Bureau of Standards for the A. S. T. M.

Guarantee—Adensite is unconditionally guaranteed to produce positive and permanent results by the manufacturers, the ADENSITE CO., INC.

Surety maintenance bonds furnished on waterproofing jobs.

Service—Our field men visit construction operations while Adensite is in use.

Independence Hall, Philadelphia
Waterproofed with Adensite gauged plaster coat

Colored Floors

PurTone colors are specially prepared for use with portland cement in floor finish and are used integrally throughout the entire top finish, assuring permanent and positive results.

(Specifications upon request.)

Applied Hardener

Adaflint, dissolved in water, 2 lb. to the gallon and slushed over an old or new floor, will render a cement finish hard and dustless.

Adaflint is furnished in natural gray, oak and green.

Shipments

Adensite is shipped in 5, 30 and 50-gal. containers.

PurTone Color is shipped in 550-lb. barrels.

Adaflint is shipped in 2-lb. boxes, 25 to a case.

Adensite Specifications

Waterproofing Mass Concrete—The gauging liquid for concrete shall be prepared by placing from 3 to 4 gal. of Adensite in a 52-gal. barrel and adding water. For every 1-bag batch, use between 3 and 4 gal. of the prepared liquid (amount of liquid varies with fineness of aggregate and temperature).

Joints Between Pourings—Shall be thoroughly grouted with Adensite grout.

Waterproof Plaster Coatings—Shall be ⅝ in. in thickness, applied in 2 coats and properly coved and bonded to the floor.

Bonding New to Old Concrete—All surfaces before application of new work shall be thoroughly roughed, cleaned and dampened with Adensite grout to insure perfect bond.

Adensite Grout—Add 1 part Adensite to 3 parts water and enough cement to give mixture a creamy consistency.

Protection of Green Work—To protect green work against action of water, the pump shall be kept in operation 24 hours after pouring or trowelling of work.

Floor Hardening—Upon the plain concrete floor slab shall be laid a 1-in. topping of 1 part cement and 2 parts clean sand. This dry mix shall be tempered with a liquid composed of 3 gal. of water to 1 qt. of Adensite for every 1-bag batch. No dryer shall be used.

Gauging Liquid for Floor Finish—Gauging liquid may be prepared by putting 4 gal. of Adensite into a 52-gal. barrel and adding water (no stirring required).

Bond—When slab is over 48 hours old, before topping is stretched, it shall be given a coating of Adensite grout.

When slab is over 7 days old, before topping is stretched, it shall be roughed with a pick or chisel, cleaned and given a coat of Adensite grout.

Brick Masonry—The mortar shall be composed of 1 part portland cement, and 3 parts clean sand, tempered with a liquid composed of 1 part Adensite to 12 parts water.

NEWARK, N. J.

ESTABLISHED 1904

REPRESENTATIVES, SERVICE AND STOCK IN ALL LARGE CITIES

Products and Services

"ANTI-HYDRO-PERMANENT," a Liquid Integral Compound for waterproofing, dampproofing, accelerating, without weakening, and for hardening all portland cement mixtures.

ARMORTOP, a liquid applied Hardener and Dust Preventer for cement floor surfaces.

ACCELLO, a water solution of commercially pure calcium chloride for Refrigeration and for Accelerating the Set of Concrete in cold weather, without freezing.

CONSULTING WATERPROOFING ENGINEERS, for consultation and design for all waterproof constructions. Correspondence invited.

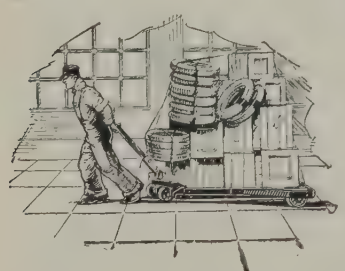
Guarantee

On many important installations we have furnished a written guarantee for a period of five years on the maintenance of waterproof concrete and the dustproofing and hardening of concrete floors. A Surety Bond will be furnished on all waterproofing installations supervised by our Engineering Department.

"Anti-Hydro" Concrete Integral Waterproofer and Hardener

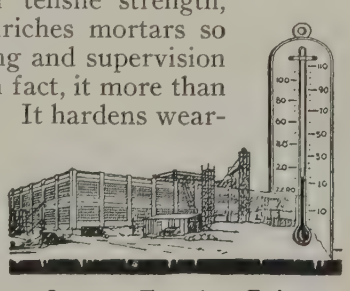
Description — "Anti-Hydro" is a liquid compound, with an affinity for cement. When added, in certain percentage to the water used in gauging portland cement mixtures in the usual way, it has the effect, without retarding setting, of rendering cement in all kinds of masonry impervious to water, moisture, frost, gas, oils, odors, sugar solutions, alkalis and most acids. It excites and brings into service all the cohesive or colloidal possibilities of portland cements, which in themselves are most efficient waterproofing mediums. There are no alums, hydrate of lime, greases, oils, stearic acid or decomposable ingredients used; neither are there any iron admixtures—all of which disintegrate concrete in time.

ANTI-HYDRO
FOR PERMANENT CONCRETE
HARDENS WATERPROOFS
TRADE-MARK



Hardens and Dustproofs Concrete Floors

"Anti-Hydro's" function may be expressed as waterproofing cement with cement; that is, filling the voids with a cement solution, which crystallizes at the same time as the cement, integrally forming a hard, insoluble silicate of greater tensile strength, density and activity. It enriches mortars so that cost of troweling, mixing and supervision is reduced to a minimum. In fact, it more than pays its cost in labor saving. It hardens wearing surfaces to a degree that makes them dustless and adamant. It lowers the freezing point of the gauging water, permitting concreting when the temperature is as low as 15° F.



Lowers Freezing Point

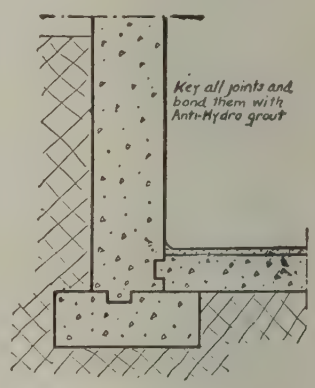
When mixed with portland cement "Anti-Hydro" forms a plastic mass which sets up very quickly and is used for calking metal passing through concrete, and for stopping leaks under pressure. Mixed with water and cement, it forms a dampproof paint which can be applied to the inside of masonry walls or to the back of limestone to prevent discoloration.

Dampproofs Brick Mortar and Prevents Efflorescence

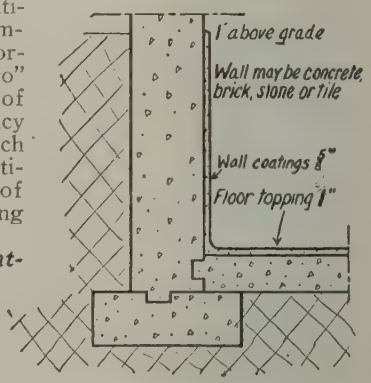
"Anti-Hydro" is used for hardening cement floors, waterproofing concrete in mass and in surface coating, and bonding topping to underlying slab; dampproofing and waterproofing brick mortar and for preventing efflorescence; waterproofing, hardening and bonding concrete roads.

Approval—The superiority of "Anti-Hydro" for waterproofing and concrete hardening is demonstrated by the permanency of work completed since 1904, and by the comparative tests of the United States Bureau of Standards. Their Technologic Paper No. 3 designates "Anti-Hydro" as Compound No. 40, and states "It is the most impermeable of any of the mortars."

Specifications—***Waterproofing in Mass***—To the 1:2:4 mix, for gauging, add 1½ gal. of "Anti-Hydro" for every cubic yard of concrete. Proper consistency will be obtained if, for each barrel of cement, 1 gal. "Anti-Hydro" and from 10 to 15 gal. of water be used. If forms are below water level, concrete should be poured extremely stiff. Unless walls and floor are poured at one time, key all joints and bond them with "Anti-Hydro" grout. (See bonding directions below.)



Floor Hardener—The 1-in. floor topping of 1:2 mix shall be gauged by addition of "Anti-Hydro" to all water used in tempering dry mixture, in proportion of 1 gal. of "Anti-Hydro" to each barrel (4 bags) of cement. The proper consistency will be obtained if, for each barrel of cement, 1 gal. of "Anti-Hydro" and 10 to 12 gal. of water be used. (See bonding directions below.)

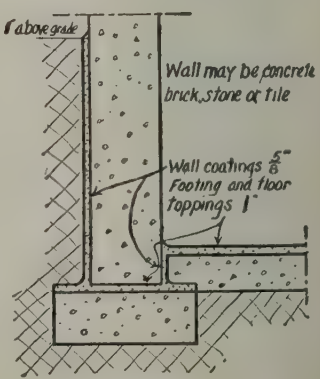


Waterproofing in Coatings—Floor work shall be 1 in. in thickness, and shall serve the double purpose of waterproofing agent and dustless wearing surface.

Wall coatings (2-coat) shall be ⅝ in. in thickness from floor level, where they shall be properly coved and bonded to floor, and carried up to at least 1 ft. above grade.

The 1:2 mortar shall be gauged by addition of "Anti-Hydro" to all water in proportion of 1 gal. "Anti-Hydro" to each barrel (4 bags) cement.

Perfect Bond—To assure perfect bond to underlying masonry, all surfaces, before application of waterproofing, shall be thoroughly roughened, cleaned, dampened and grouted.



Continued on next page

A slush or grout of neat cement, using 1 part "Anti-Hydro" to 3 parts of water, is first applied. Coatings shall be applied not later than 24 hours after surfaces have been prepared and while slush coat is still wet.

Note: Specifications for waterproofing *Brickwork, Stucco on Solid Masonry* and *Stucco on Metal Lath* and *Dampproofing* furnished on request.

Acid Resisting—Write for special specifications.

Road Work—"Anti-Hydro" is especially suited for concrete pavements and roads. It makes concrete as hard in 24 hours as it would ordinarily be in 8 days and actually increases the strength of concrete 22%. Due to its quick hardening qualities, roads are made ready for use in 24 hours after they are laid by mixing 1 gal. of "Anti-Hydro" to 10 gal. of water.

"Anti-Hydro" can be used with any portland cement at a minimum cost.

For maintenance work, "Anti-Hydro" will bond new concrete securely to old.

"ANTI-HYDRO" QUANTITIES

Kind of work	Quantity Anti-Hydro per bbl. cement	Covering capacity
Waterproofing in mass 1:2:4 concrete	1 gal.	⅔ cu. yd. concrete
Waterproofing ⅝-in. plaster coat	1 gal.	100 to 125 sq. ft.
Waterproofing 1-in. floor topping	1 gal.	100 to 80 sq. ft.
Waterproofing stucco ⅞ in.	1 gal.	100 sq. ft.
Waterproofing brickwork ⅜-in. joint	1 gal.	700 brick or 35 cu. ft.
Dampproofing brickwork ⅜-in. joint	1 gal.	1000 brick or 50 cu. ft.
Dampproofing in cement wash	8 gal.	3200 sq. ft.—2 coats
Hardening cement floor 1-in. topping	1 gal.	100 to 80 sq. ft.

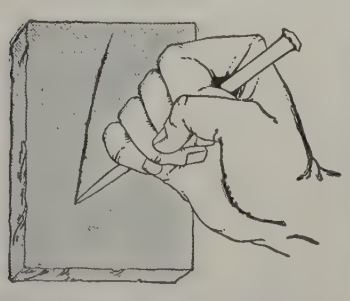
Armortop Concrete Applied Dustproofer and Hardener

Description—Armortop is a liquid compound which, when applied to any concrete surface, old or new, changes the soft granular topping of the concrete into a granitelike mass that resists the most severe wear and abrasion without dusting up. The application of Armortop insures added years of wear and use for any cement floor whether it has just been laid or whether it has been in service for several years. It saves tearing up and relaying old floors which are beginning to rut.

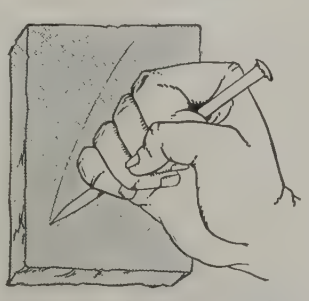
ARMORTOP
THE APPLIED HARDENER FOR CONCRETE
TRADE-MARK

So easily, quickly and surely does Armortop transform soft, crumbling, dusting floors into new, hard, dustproof ones, that the whole job can be performed in the evening after closing hours by any ordinary laborer. Next morning floors are ready for use without loss of time, costly shutdowns and delays to manufacturing.

No skill is required to apply Armortop. Simply mix it with water and brush it with a stiff brush or broom over the surface to be treated.



An Ordinary Concrete Surface Can be Deeply Cut with a Nail or Pointed Instrument as Shown Above



The Same Concrete Surface Treated with Armortop Becomes so Hard That It Can Scarcely Be Scratched with the Same Nail

Armortop reacts chemically with cement and combines with it, forming a new compound which binds the loose, disintegrating particles of the concrete mix into a dense hard mass. Because of this reaction, Armortop results are permanent and should not be confused with temporary paint coatings. The covering capacity of Armortop varies with the density of the floor. One gallon will cover from 70 to 150 sq. ft. of floor surface.

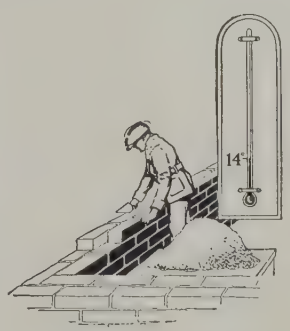
A concrete test slab treated with Armortop will be sent to any one desiring to make the comparative test.

Specifications—Upon the clean, dry floor apply a solution of 1 part Armortop and 1 part water in 2 or more coats, depending upon the density of the floor. Allow 4 hours to elapse between coats.

Accello Concrete Accelerator and Anti-Freeze

Description — Accello, a liquid solution, is used to accelerate the set of cement mortars and floor finish in very cold weather, and to make possible the hydration of portland cement mixtures at temperatures as low as 14° F.

ACCELLO
For Accelerating the Set of Cement
TRADE-MARK



In plain concrete, cement plaster, floor toppings, brick mortar, and road work, the use of Accello during the winter months, when the temperature falls as low as 14° F., is indispensable. It insures masonry work against frost and freezing, and permits work to continue during the cold weather.

Accello makes better concrete road work possible, speeds up work and reduces delays to traffic to a minimum.

Accello makes bricklaying possible until the temperature drops below the point at which it pays to keep the men at work.

Accello is a standardized solution of calcium chloride, uniform in quality and strength. It is easy to use. Any unskilled workman can add it to the gauging water. The proportions necessary are shown below:

Proportions of Accello and Water at Outside Air Temperatures—

35° F., use 1 part Accello with 20 parts water
32° F., use 1 part Accello with 15 parts water
28° F., use 1 part Accello with 12 parts water
25° F. (or less), use 1 part Accello with 10 parts water
14° F. (or less), mechanical heat is necessary

Detailed Information

Write for complete data and specifications for any work within the scope of "Anti-Hydro" products. The services of our Engineers are available at all times.

Dealers Everywhere Carry Stock

A complete stock of "Anti-Hydro" products is carried by dealers throughout the country.

Shipment

"Anti-Hydro" is shipped in standard containers of 5, 10, 20 and 30 gal.

Armortop, in containers of 5, 30 and 50 gal.

Accello, in barrels of 50 gal.

ESTABLISHED 1895

THE ANTIHYDRINE COMPANY

308 Washington Building
NEW HAVEN, CONN.

Product

Manufacturers of ANTIHYDRINE, a Coating for Dampproofing and Stainproofing.

Description

Antihydrine is a material made of a high grade of asphalt carefully prepared in combination with several chemicals, which combination gives it the peculiar property of *forming (without heating) a continuous glossy and impervious coating upon porous surfaces, without penetration.*

Antihydrine is the pioneer dampproof paint, having been first made in 1895. *There has been no subsequent change in formula.*

Advantageous Features

(1) Antihydrine eliminates the necessity of using lath and wood furring for interior plastering of outside walls, plastering being applied over the Antihydrine within 24 hours.

(2) Renders walls dampproof.

(3) Prevents staining of plastering on walls and on fireproof work; also, the following:

Applied to Inside of Outside Walls—(4) No furring needed—cost of and space occupied by furring are saved.

(5) Dangerous places to harbor vermin and encourage fires (when wood furring is used) are eliminated.

(6) Outside walls are made absolutely dampproof.

(7) Building is made warmer and more easily heated.

(8) All staining of and efflorescences on plastering are avoided.

Applied to Fireproof Blocks in Ceilings and Partitions—(9) All staining and efflorescence prevented.

(10) Plastering on blocks dries quickly, saving much time.

(11) All plastered surfaces permit diversified decoration without danger of damages from dampness.

(12) Discoloration of plastering from smoky brick is prevented.

Applied to Built-in Surfaces of Iron, Limestone, Marble, Face Brick, etc.—(13) All ironwork built in wall is preserved.

(14) Staining and efflorescence on exterior of limestone, marble and brick are prevented.

(15) Use of *ordinary* cement mortar in the backing is allowed, thus saving time and money otherwise spent in preparation of expensive cement mortar.

Application

After being well stirred, the Antihydrine contents are poured into a pail and any laborer can apply same *cold* with a brush. Material is fully prepared, ready for use, and is applied as easily as whitewash; *the coating, however, must be kept absolutely continuous, covering every part.* A second coat can be applied, if desirable, within a few hours after the first application.

Covering Capacity

Extensive, by reason of its lack of penetration. 1 gal. covers about 100 sq. ft. of brickwork or fireproofing, 1 coat; or, 60 sq. ft., 2 coats; 1 coat, properly applied, is sufficient for the prevention of dampness and stains.

Shipment

Antihydrine is delivered in casks of 10 and 50 gals.

Cost

The cost of Antihydrine is $1.25 per gal.

Specification Data

The brush shall be the kind used for oiling brick fronts; contents of barrel to be thoroughly stirred before application; every part to be covered, leaving no small holes, etc.; coating to be thin where it is to be plastered over, with sufficient body to leave a glossy surface; and the Antihydrine to be soft or "tacky" when plastering is applied.

First coat of plastering, as thin as will allow of proper scratching, will dry quickly; second coat is applied immediately thereafter; after drying, third and last coat of plastering is applied when, after a few days, surface will be ready for painting and decorating.

Dum Dum—A Method for Plastering Direct to Concrete

Dum Dum insures permanent adhesion of plaster to concrete surfaces. It is the result of years of intensive research and tests. It has been extensively used without a failure since 1915.

Initial Dum Dum jobs installed early in 1915 are in perfect condition with no sign of deterioration and with every indication that the plaster will adhere to the concrete for many years longer. The success of the above instances and others that followed were sufficient to warrant the continued use of Dum Dum by many nationally known architects.

What Dum Dum Is

Dum Dum is an original patented product which the ARCO COMPANY alone has and it cannot be classed with any of the other methods of bonding plaster to concrete. It is a plastic material that is applied with a trowel, forming a layer between the concrete and plaster. Dum Dum takes the place of the scratch coat. If the surface is smooth, the brown coat can be finished off and used as a finish coat. The condition of the concrete usually determines whether one or two coats of plaster are necessary to produce an even surface.

No time is wasted when applying Dum Dum—put Dum Dum on, then plaster over it immediately. Dum Dum comes ready for use. It is applied by the plasterer. It eliminates the necessity of other trades and at the same time affords the advantage of one trowel coat where more than one coat is required. Dum Dum and plaster are applied from the same scaffold.

Many architects specify suspended ceilings even when appearance is not an object, simply to insure permanance. Since the advent of Dum Dum this is no longer necessary. Not only is Dum Dum absolutely permanent, but its cost is lower than older methods.

How Dum Dum Solves the Five Causes of Plaster Failures

The failure of plaster when applied directly to concrete and masonry surfaces has been attributed to many widely different causes, and, while there may be various contributing factors, the fundamental reasons can be reduced to the following: efflorescence, vibration, unequal rate of expansion and contraction between concrete and plaster, laitance, and smooth concrete.

Efflorescence—The free lime and salt content that is in practically all concrete is carried to and deposited on the surface by means of the moisture that is continually passing through the concrete slab. These deposits form a salt crust known as efflorescence. This action is continuous, even when plaster is applied directly to the concrete, as there is nothing to seal the pores of cement. These deposits act as a wedge and force the plaster from the concrete.

Dum Dum eliminates this condition. It seals the pores in the concrete with an elastic film about ⅛ in. thick, which shuts off the circulation within the concrete. Dum Dum remains permanently plastic and does not disintegrate—it provides a permanent seal and thus safeguards against the paramount cause of plaster failures—efflorescence.

Vibration—Constant vibration causes only a limited portion of plaster to adhere to the concrete even under the best of conditions, because the force of the jar asserts itself at the bond due to the difference in the strain at this point.

By reason of its elasticity, Dum Dum acts as an air cushion, shock absorber taking up the jar.

Expansion and Contraction—As concrete and plaster do not expand and contract at the same ratio there is an internal strain at the bond during change in temperature. As the bond is the weakest part of the construction it is the first to give way. When Dum Dum is applied it remains permanently elastic and produces a film of ⅛ in. thick that takes care of this unequal rate of expansion and contraction and furnishes the necessary strength required to insure the permanency of the plaster adhesion.

Laitance—Laitance is a spongy surface film developed during the setting process of concrete with the result that a very undesirable surface is presented for the adhering of plaster. Dum Dum nullifies the effect of laitance. It is a combination of unusually tenacious and adhesive oils. These oils penetrate through the laitance, to the solid concrete, enter the pores, completely seal them, and at the same time bond the laitance coating firmly and solidly to the concrete surface so that no peeling can ever occur. Permanent elasticity of Dum Dum is maintained by incorporating a much greater percentage of oil than would ordinarily be required. This allows for the extraction of enough oil to bind the laitance to the concrete and to film over the pores so as to eliminate further oil extraction.

Smooth Concrete—Smooth hard finish concrete is so unusually dense and the pores are so very small that it is practically impossible to force plaster into the pores and secure the necessary suction. The oils of Dum Dum penetrate into the concrete just enough to work in and around the pores and bind the particles of cement into a homogeneous mass. After this action takes place, Dum Dum, which is applied ⅛ in. thick, sets up a tough rubbery film on the side next to the cement and on the side next to the plaster, thus leaving the Dum Dum between these two films permanently elastic so as to provide a "live" bond.

Standard Specifications for Bonding Plaster to Concrete Ceilings with Dum Dum

(1) Preparation of the Surface—(a) The plaster contractor shall allow sufficient time after removal of the forms to insure thorough drying and hardening of the concrete.

(b) Loose sand, pebbles, or cement shall be removed by wire brushing.

(c) Efflorescence shall be removed by treating the surface with acid, and thoroughly washing with clean water. In all cases the concrete surface must be absolutely dry and clean before the application of Dum Dum.

(2) Application—Trowel one coat of Dum Dum on all concrete surfaces to which plaster is to be applied.

(3) Application of Plaster—Plaster may be applied to the Dum Dum at any time up to three hours after the application of the Dum Dum. No plaster shall be applied to the surface after this time.

AQUABAR WATERPROOFING PRODUCTS

Twenty-seven Years of Quality and Service—1901-1928

For the past 27 years we have specialized in the manufacture of waterproofing and dampproofing materials, floor hardeners and protective coatings of all kinds.

As pioneers in solving the most difficult waterproofing problems, Aquabar has proven to be a most economical and efficient waterproofing compound. It is used extensively in the construction of swimming pools, reservoirs, vaults, foundations, tunnels and all other kinds of masonry construction.

Detailed architects' specifications and information on any of our products will be furnished upon request, without any obligation on your part.

Integral Waterproofing

No. 1 Integral Compound—A soft semipaste which is easily dissolved in water for waterproofing mass concrete, cement plaster, cement mortar for brick and stone work, stucco, etc. It does not affect the strength of concrete, but increases its effectiveness with age.

Specifications for Waterproofing Mass Concrete—A dry mixture of cement, sand and stone—1:2:4 mix, shall be tempered to a medium wet consistency with water, to which 1 part of Aquabar Integral Compound No. 1 has been added to every 50 parts of water, in strict accordance with manufacturer's directions.

Covering Capacity—From ½ to ⅔ gal. will waterproof 1 cu. yd. of mass concrete 1:2:4 mix.

Senior High School, Reading, Pa.
Ritcher & Eiler, Architects M. Melody & Son, Contractors
A. H. Leader, Superintendent of Buildings
Foundation walls, floors, etc., waterproofed with Aquabar Aquatite Integral Liquid Waterproofing. Subject to pressure of water

Specifications for Waterproofing Cement Mortar and Stucco—The waterproofed cement mortar, consisting of 1 part cement, 2 parts sand with water, shall be prepared by tempering to required consistency, to which 1 part Aquabar Integral Compound No. 1 has been added to every 25 parts water, in strict accordance with manufacturer's directions.

Covering Capacity—1 gal. will waterproof approximately 150 to 175 sq. ft. 1-in. top coat 1:2 mixture cement mortar, or, approximately, 200 to 250 sq. ft. of cement stucco 1 in. thick.

Aquatite Integral Liquid Waterproofing—A liquid compound for waterproofing and accelerating mass concrete and cement mortars.

Specifications for Waterproofing Mass Concrete—To the 1:2:4 mixture for gauging add 1½ gal. of Aquatite for every cubic yard of concrete. Proper consistency will be obtained if for each barrel of cement 1 gal. of Aquatite and from 10 to 15 gal. of water be used. If forms are below water level, an extremely stiff mixture should be poured.

Specifications for Waterproofing Cement Mortars—The 1:2 mortar shall be gauged by the addition of Aquatite to all water used in the proportion of 1 gal. of Aquatite to each barrel (4 bags) of cement.

Covering Capacity — Approximately 1½ gal. will waterproof 1 cu. yd. concrete 1:2:4 mix; 1 gal. will waterproof 100 sq. ft. 1-in. top coat 1:2 mix cement mortar.

Continued on next page

Colorless Waterproofing—Clear-Coat No. 2

A colorless, transparent liquid for waterproofing and dampproofing outside walls (above grade) of brick, stone, concrete cement, terra cotta, stucco, etc. Clear-Coat No. 2 does not discolor surfaces to which it is applied. Penetrates readily, filling all pores, rendering the surface impervious to moisture and driving rains.

If required, we will submit estimates for furnishing and applying by spray.

Covering Capacity—Approximately, 125 sq. ft., 1 coat; 80 sq. ft. per gal., 2 coats, depending upon porosity.

Dampproofing

Statite Plaster Bond No. 3—A black compound for application to masonry surfaces of all kinds, so as to form a dampproofing and bond for plaster. It eliminates furring and lathing.

Covering Capacity—Approximately, 75 sq. ft. per gal., 1 coat; 50 sq. ft. per gal., 2 coats.

Marine Cement No. 3A—A black compound of heavy consistency for dampproofing exterior foundation walls below grade, also for application to floor slabs of ground floors. Applied cold.

Covering Capacity—Approximately, 60 sq. ft. per gal., 1 coat; 40 sq. ft., 2 coats.

Stone Backing No. 3B—A black compound for dampproofing unexposed surfaces of cut stone and for rustproofing metal surfaces. It is applied just as it comes from the container.

Covering Capacity—Approximately, 125 sq. ft. per gal., 1 coat; 75 sq. ft., 2 coats.

Mastic Insulite Cement No. 4—A black mastic for waterproofing foundation walls, tunnels, etc., against heavy water pressure; for overcoating, calking and patching old roofs; sealing cracks, open joints, etc. Applied cold (with trowel) $\frac{1}{8}$ to $\frac{3}{16}$ in. thick according to the smoothness of the surface. When set, it has the consistency of hard rubber, never gets brittle and is unaffected by changes in temperature. Very elastic and adhesive; works freely.

Covering Capacity—Approximately, 25 to 30 sq. ft. per gal., 1 trowel coat.

Floor Hardeners

Iron-Clad Crystals No. 7B (Surface Treatment)—These crystals are dissolved in water, and applied to the concrete surface with a stiff brush or broom in 2 coats of equal strength for wearproofing, waterproofing and dustproofing of same.

Covering Capacity—Approximately, 2½ lb. will treat 100 sq. ft. of surface with 2 coats.

Liquid Floor Hardener (Integral Method)—This liquid is added to the water used in mixing the cement top coat for wearproofing, waterproofing and dustproofing cement floors.

Covering Capacity—1 gal. will harden, approximately, 100 sq. ft. of 1-in. top coat, 1:2 mixture cement mortar.

Crysteel Metallic Hardener No. 7—Metallic particles that are mixed with the cement used for top coating. It forms a metallic crust that will withstand most severe traffic. Designed for factories, warehouses, etc.

Covering Capacity—Approximately, 30 lb. mixed with 30 lbs. portland cement will treat 100 sq. ft. of surface dust coat.

Quick Set Anti-freeze and Accelerator

This liquid is added to the water used in mixing mass concrete, cement mortar, etc., for accelerating the set so as to prevent freezing. Causes a rapid evaporation of the water and speeds the final set permitting work to continue in temperatures as low as 20° F.

Floor Coatings

Wood Floor Preservative—A translucent liquid for preserving and dustproofing maple and yellow pine floors, without changing the appearance of the surface. It prevents rotting and decay, and adds to the wood those essential elements of preserving its life and appearance.

Covering Capacity—Approximately, 250 sq. ft. per gal. for 1 coat; 350 sq. ft. per gal. for 2 coats, depending upon the porosity.

Conco Cement Floor Paint—For coating cement floors above or below grade. It prevents dusting and disintegration of floors; is extremely durable, and resists wear to a remarkable degree.

Covering Capacity—Approximately, 250 sq. ft. per gal. for 1 coat; 150 sq. ft. per gal. for 2 coats.

Paints

Elasticote No. 6 Waterproof Paint—A highly specialized liquid cement coating for waterproofing and dampproofing exterior and interior concrete, brick, cement, stucco, plaster and masonry walls. Gives a handsome stonelike appearance and offers excellent wearing qualities. Made in various colors.

Covering Capacity—Approximately, 150 sq. ft. per gal. for 1 coat; 100 sq. ft. for 2 coats.

Marine Waterproof Paint—A decorative and protective coating for application to interior surfaces, swimming pools and surfaces immersed in water. It covers well and adheres firmly. Made in various colors.

Covering Capacity—Approximately, 150 sq. ft. per gal. for 1 coat; 100 sq. ft. per gal. for 2 coats.

Roof Coating No. 5—A pure Trinidad asphaltum product having remarkable adhesive and saturating properties for overcoating and waterproofing roofs of every description. Restores life and waterproofing properties to any roof which had been exhausted by exposure to the sun. It is applied cold with a brush.

Covering Capacity—Approximately, 100 sq. ft. per gal. for 1 coat.

Sterlite Flat Wal-Finish—A high grade washable paint for finishing interior plastered surfaces.

Wal-Wite Enamel and Undercoating (Mill White)—A high grade mill white possessing high light reflecting qualities. Particularly useful for application to walls, ceiling and columns for daylighting interiors. It retains its whiteness and can be repeatedly washed without injuring it. Will not turn yellow.

Fabricators Red Oxide, Carbonite Steel Coating (Structural Steel Coating)—A paint made of the best rust inhibitors or moisture excluders known. For the protection of structural steel. Resists electrolysis to the maximum degree.

Triple Seal System of Waterproofing

This system is used for waterproofing swimming pools, reservoirs, tunnels and basements where the water head is 2 ft. or more. It has a combination of the old membrane and the new integral systems.

Specialties

We furnish and apply dampproof coatings and colorless waterproofing, furnishing guarantee with same.

THE ASPHALT PRODUCTS CO., INC.

Manufacturers of Bituminous Products

SYRACUSE, N. Y.

DISTRIBUTORS IN MANY CITIES OF THE UNITED STATES, REPRESENTATIVES IN ALL

Products

123 "Hydro Proof"—a permanent waterproofing and Dampproofing Agent.

"Hydro Proof" Plaster Bond.

"Hydro Proof" Plastic—a Calking Compound.

"Bond-N-Seal"—a Setting Compound for Corkboards and Blocks.

"Bitumet"—a Protective Coating for all metals.

Hydro-Proof

123 "Hydro Proof"—A Permanent Waterproofing and Dampproofing Agent

For walls, floors, cisterns, pits, etc.

123 "Hydro Proof" is pure Mexican base asphalt atomized and held in suspension in a water vehicle without the use of oils, solvents or adulterants. Having the physical characteristics of water, it is carried by capillary attraction into every pore and void of the surface on which it is applied. It is odorless and tasteless, and expands and contracts without checking or cracking.

Superficial Method—Engineers and architects agree on the success of this method. It embraces the use of 123 "Hydro Proof" applied to the surface by brushing, mopping, or spraying. Its application on the outside of walls below ground level is desirable, and it will be found fully efficient for inside use except where high hydrostatic pressures exist.

Specification for Superficial Method—

For use on new or old walls where high hydrostatic pressure does not exist.

The outside [inside] face of all foundation walls below grade level shall be treated with 123 "Hydro Proof" Waterproofing as manufactured by The Asphalt Products Co., Inc., of Syracuse, N. Y.

Application—All surfaces shall be dry, free from dust, oil and grease to assure proper penetration. Thoroughly stir contents of container and reduce part for the bonding or priming coat with not more than 20% clean water by volume. "Hydro Proof" shall be applied at a temperature not lower than 50° F. with a clean brush or mop, (free from oil and grease) or spray, covering approximately 80 sq. ft. per gal. After priming coat has set, apply a full strength coat (material as received thoroughly stirred).

Protection—The final coat shall be protected with a ½-in coating of cement mortar.

Note: Where this waterproofing has been applied on exposed masonry surfaces and black color is objectionable, use the following clause:

Finishing Coat—The final coat on all exposed walls shall be covered with a thin wash of portland cement and sand brushed on. After the finishing coat has set apply with a brush a coat of ..... stucco color.

Membrane Method—Here again, the superiority of 123 "Hydro Proof" is apparent, as it bonds perfectly without decreasing the crushing or tensile strength of the construction, and in addition to its water, acid and alkali resisting qualities has the necessary characteristics of strength and flexibility to bridge over hair cracks in the concrete due to defective workmanship or other causes.

The membrane is built as an inset in the concrete wall, floor, etc., and forms an indestructible waterproof skin, excluding all moisture. It is protected from abrasion by the concrete on both sides.

It has been found by experience that about ½ in. from the finished thickness on the water pressure side is the proper place to introduce the 123 "Hydro Proof" membrane. It does not allow penetration of sufficient moisture in the remaining concrete applied over the membrane to cause trouble from freezing, or the penetration of acids, alkalis, etc.

Specification for Membrane Method—

For use on new walls and floors where hydrostatic pressure exists.

The outside face of all foundation walls, top of footings, and the surface of all concrete floors at least 4 in. below finished floor level shall be treated with 123 "Hydro Proof" Waterproofing as manufactured by The Asphalt Products Co., Inc., of Syracuse, N. Y.

Application—All surfaces shall be dry, free from dust, oil and grease, to assure proper penetration. Thoroughly stir contents of container and reduce part for the first coat with not more than 20% of clean water by volume. "Hydro Proof" shall be applied at a temperature not lower than 50° F., brushing it thoroughly on the unfinished concrete (the brush shall be free from oil and grease). When set, flow on a heavy second coat (full strength), using 2½ to 3 gal. per 100 sq. ft.

Protection—The final coat on all vertical surfaces shall be protected with at least ½-in. coating of cement mortar [.... in. of concrete].

The final coat on all floors shall be protected with .... in. of concrete including a 1-in. finished surface.

Note: Not less than 4 in. of concrete should ever be used where hydrostatic pressure exists. Mass concrete should be sufficient in weight to withstand the pressure, or where less concrete is desired, the concrete slab between waterproofing membrane and finished floor must be reinforced.

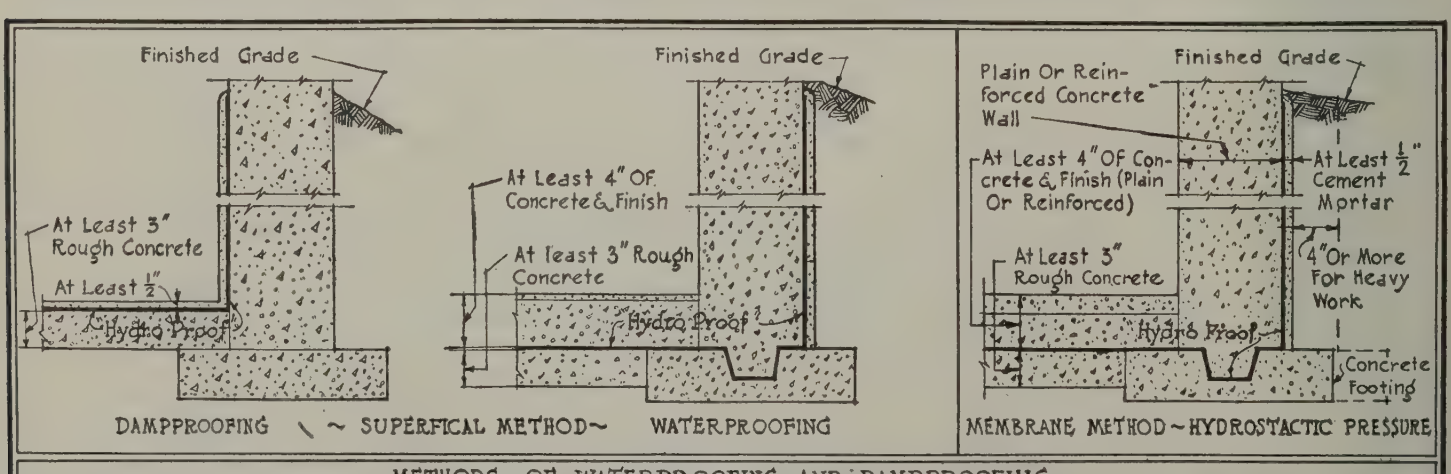
"Hydro Proof" Plaster Bond—

For bonding plaster or stucco to concrete, brick, tile, gypsum, etc.

This permanent waterproofing agent being atomized pure Mexican base asphalt, suspended in a water vehicle without the use of solvents, oils or adulterants, has the physical characteristic of being absorbed by capillary attraction into any porous wall construction over which it is applied, permanently sealing same against dampness and moisture which would otherwise penetrate and stain the interior finish.

"Hydro Proof" Plaster Bond eliminates the necessity of furring or lathing except on ceilings.

Used on woodwork to be set against new masonry or con-



METHODS OF WATERPROOFING AND DAMPPROOFING

Continued on next page

struction subject to moisture, it will prevent rotting, cracking or warping.

Remains elastic—expanding or contracting under all atmospheric variations.

Specification for Plaster Bond—

For use on old or new interior or exterior masonry walls and ceilings.

General—All interior and exterior—surfaces (specify surface) shall be given two (2) coats of "Hydro Proof" Plaster Bond as manufactured by The Asphalt Products Co., Inc., of Syracuse, N. Y.

Preparation of Surface—Surfaces shall be dry, and free from all loose and foreign materials. Where paint, oil, grease, etc. are present, a suitable cleaner shall be used, the surface flushed with clean water and permitted to dry.

Application—"Hydro Proof" Plaster Bond shall be applied in two (2) coats with a new, clean, wide brush or suitable spray.

If brush is used, the first coat shall be diluted with 20% clean water, by volume; the second and final coat undiluted and as received in container.

If sprayer is used, "Hydro Proof" Plaster Bond shall be diluted to the consistency required by spray nozzle. Only sprayer suitable for heavy paints or asphalts shall be used.

"Hydro Proof" shall be brushed or sprayed in a continuous coat over all surfaces of walls, working it well into all corners and joints; also on walls where partitions and floor slabs will abutt the exterior walls. When this is not feasible, it shall be carried out from the exterior walls for a distance not less than 12 in. on such intersecting partitions and floor slabs.

Note: The following provision shall be included by the Architect in his specification for Plastering Work.

Plaster or stucco shall be applied directly over "Hydro Proof" Plaster Bond after the latter has thoroughly set, which will be indicated by its being slightly tacky to the touch, but which will not adhere to the fingers.

"Hydro Proof" Plastic—A Glazing and Calking Compound

For glazing, calking, airproofing, soundproofing, waterproofing, dampproofing, etc.

A compound of pure Mexican base asphalt suspended in water and processed without the use of oils, solvents or saponifying agents. *It is not a coal tar product.* When applied, it contracts and expands under all climatic conditions without checking, cracking or peeling. It is fire-safe, odorless and tasteless.

To this asphalt base is added pure Canadian asbestos. It is automatically machine mixed, thus guaranteeing a uniform product.

Glazing—"Hydro Proof" Plastic is a permanent and economical glazing compound. Used the same as putty, it may be spread with a putty knife or our automatic gun. Does not check, crack or peel and is unaffected by the elements as it contains no oils or solvents to oxidize.

"Hydro Proof" Plastic seals the glass to the frame, making it impervious to moisture, snow, rain, air, acids, alkalis, chemical or noxious gases.

For greenhouses it is the most satisfactory glazing compound as it stays in place, never cracks or peels off from the vibration of the greenhouses during heavy winds, and it keeps the building watertight.

Calking—"Hydro Proof" Plastic, applied with our automatic gun or with a putty knife will permanently fill and seal all cracks and crevices around windows and doors, as well as seams in metal roofing or siding, cracks in masonry, etc. It also has the desirable quality of being a non-conductor of sound, and may be confidently used with soundproofing materials.

Colors—"Hydro Proof" Plastic is black. Where a maroon glazing compound is wanted, we can supply one of bitumen, an indestructible filler with just a sufficient quantity of high grade oil to hold the coloring matter.

Specifications for "Hydro Proof" Plastic—

For use as a glazing compound:

All wood [metal] sash throughout the building shall be glazed with "Hydro Proof" Plastic as manufactured by The Asphalt Products Co., Inc., of Syracuse, N. Y.

Application—"Hydro Proof" Plastic shall be applied with a putty knife or an automatic gun and smoothed the same as putty.

Note: The automatic gun is sold by The Asphalt Products Co., Inc., of Syracuse, N. Y.

For use as a calking compound:

All wood window and door frames shall be calked with "Hydro Proof" Plastic as manufactured by The Asphalt Products Co., Inc., of Syracuse, N. Y.

Application—All exterior staff beads or exterior moulds shall be removed and space between wood frames and masonry [metal] jambs, heads and sills shall be raked out and cleaned, then calked tightly with oakum leaving a recess at least ½ in. deep; this recess shall be filled and calked with "Hydro Proof" Plastic applied with a putty knife or an automatic gun. Smooth with putty knife.

Note: The automatic gun is sold by The Asphalt Products Co., Inc., of Syracuse, N. Y.

"Bond-N-Seal" — A Setting Compound for Corkboard and Block Insulation

This quick setting, odorless compound permanently bonds corkboard to walls and ceilings, also corkboard to corkboard and joints around same.

"Bond-N-Seal" is waterproof, airproof, acidproof, alkaliproof and verminproof. It is not affected by ammonia fumes, chemical or noxious gases or salt brine.

"Bond-N-Seal" is pure asphalt with a patented silica filler. Contains nothing to oxidize or deteriorate. The pure asphalt used in the manufacture of "Bond-N-Seal" contracts and expands under all temperature changes encountered in the cold industries without checking or cracking.

Specifications for "Bond-N-Seal"—

For setting corkboard lining of masonry refrigerators:

The interior walls, ceilings and floors of all masonry refrigerators shall receive a 3/32-in. thick coat of "Bond-N-Seal" applied with a trowel. After this coating has set (2 to 3 hours) the corkboard shall be set. Coat the back and edges of each board with "Bond-N-Seal" 3/32 in. thick and press firmly in place, all joints shall be thoroughly pointed. Cork must be held against ceiling with skewers until set.

Note: If walls and ceilings are to be protected or covered with cement plaster or tile and the floor covered with finished concrete or tile, use the following clauses:

The entire surface of the corkboard lining on walls, ceilings and floors shall receive a 3/32-in. thick coat of "Bond-N-Seal" applied with a trowel, as a bonding coat to the finished masonry lining.

The application of "Bond-N-Seal" shall not be done in a temperature lower than 65° F.

"Bitumet"—A Protective Coating for All Metals

A jet black, glossy, permanent preservative for all metallic surfaces. It is unaffected by any temperatures from a low minus to 400° F.

"Bitumet" is not affected by the action of any commercial acid or alkali, consequently it is immune to the action of any fumes or gases encountered in any industry.

Being composed of pure natural asphalts "Bitumet" is waterproof. It can be applied at any temperature where it works out under a brush, or it can be applied with a spray. It dries quickly and has a covering capacity of 300 sq. ft. per gal.

No distilled or blown asphalts are used in the manufacture of "Bitumet." It is a supercoating that will meet in a highly satisfactory way every problem for protecting metallic surfaces against all forms of corrosion. This blend contains no oxidizing agents whatsoever, consequently is not amenable to cracking or checking under varying temperature changes.

"Bitumet" is recommended for coating all structural steel, brine coolers, blowers, running gears of trucks, tanks, coils, condensers, ice cans, cooling towers, water softeners, steam and waterpipes, valves, fittings, etc.

Specifications for "Bitumet"—

The contractor shall thoroughly clean the surface of all structural steel (or insert other metal) free of all rust scale, dirt, grease, oil, etc., and shall then apply, with brush or spray strictly in accordance with manufacturer's instructions, one [two] coats of "Bitumet" as manufactured by The Asphalt Products Co., Inc., of Syracuse, N. Y.

WATERPROOFS PERMANENTLY
TRADE-MARK

Services and Guarantee Bond

Contractors for the execution of waterproofing in all sections of the country, making a specialty of difficult operations where other materials have failed.

Will furnish bond from any bonding company, when required, guaranteeing work to remain absolutely watertight for a long term of years.

An engineering department is maintained, which is at the service of all seeking advice on any questions concerning waterproofing of tunnels, subways, foundation walls, sewers, reservoirs, etc.

"B-M No. 78" Bitu-Mortar Liquid Waterproofing Compound

This is a bituminous emulsion which can be readily incorporated in ordinary portland cement mortar, rendering same absolutely and permanently impervious to water, even under severe pressure.

Mortar so prepared will bond perfectly to either old or new concrete, brick, stone or iron, and can be applied to surfaces even when water is coming through.

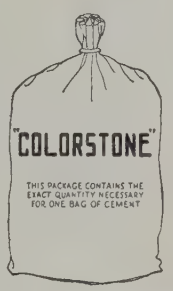
"Colorstone" for Coloring, Hardening and Dustproofing Cement Floors (Interior or Exterior)

"Colorstone" is a scientifically compounded mineral and chemical powder which, when added to cement mixtures, produces color effects that are permanent, non-fading, acid resistant and not affected by actinic rays of light. It makes the cement extremely dense and hard.

"Colorstone" can be used with equal satisfaction in portland cement mixtures for colored floors, walks, steps, porches, roof gardens, tennis courts, swimming pools, mortar, stucco, precast articles and fountains.

Method of Use

"Colorstone" comes packed in individual packages, each of which contains the exact quantity required for one bag of cement. This eliminates all weighing or guesswork on the job and insures a uniform result.



Quantities Required Per Bag of Cement

Red, brown, blue, battleship gray, french gray, yellow, orange and black...10 pounds
Green .....15 pounds
Cement Gray ..... 5 pounds

Also more than 100 special colors and shades.

"Colorstone Wax" for High Gloss Finish Floors

"Colorstone Wax" is supplied in colors to match "Colorstone" floors, and provides a permanent high gloss finish. One application of "Colorstone Wax" will last for many years.

Architect's Specification for "Colorstone" Floors

All cement floors as listed herein shall have incorporated in the finish coat, in strict accordance with the manufacturer's directions, "Colorstone" coloring and hardening compound, as manufactured by the Builders Specialty Company, Inc., Philadelphia, Pa. One package of the desired color shall be used per bag of cement in the mix.

Top Coat Mix—Shall be one part portland cement, two parts clean, sharp, coarse sand and one package of "Colorstone" of desired color for each bag of cement used in the batch. Only sufficient water shall be added to make a stiff mix, and the mixer shall revolve two full minutes before the discharge of each batch. Place the topcoat in the usual manner and at the proper time float and trowel to a smooth and even texture, mark off in blocks as directed by the architect. Three steel trowelings shall be given the surface, the last troweling to be done when the surface will finish off without defects of any kind.

Curing and Protection—After floors are sufficiently hardened so as not to be damaged they shall be covered with two inches of non-staining sawdust or sand and this protective covering shall be kept wet for five days.

Protection Against Stains—After the curing coat has been removed all floor surfaces shall be coated with "Anti-Stain" (as furnished by the Builders Specialty Company, Inc.) to protect the floors from plaster stains, etc. When all work liable to stain floors has been completed the "Anti-Stain" shall be removed by scrubbing, using hot water or water and ammonia.

Waxing and Polishing—After the "Anti-Stain" has been removed the floors shall be waxed with "Colorstone Wax" as furnished by the Builders Specialty Company, Inc., Philadelphia, Pa. The "Colorstone Wax" shall be applied as thinly as possible, using a soft cloth, and the floors immediately polished with hair brushes by [hand] [machine]. The "Colorstone Wax" shall match the floor color.

Gray Metallic Hardener "Orthite" No. 10

For use on interior cement floors which are subjected to heavy traffic such as will be found in warehouses, factories and garages. A product (secured by pulverizing iron) which is mixed with neat cement and applied as a dust coat to the fresh concrete floor. It produces practically wearproof, dustproof, waterproof and oilproof surfaces. Being of a much harder and tougher nature than the aggregate, it produces a wearing surface which withstands the most severe usage. In our fifteen years' experience we have seen "Orthite" No. 10 floors subjected to the severest kinds of traffic without a single failure.

Specification for "Orthite" No. 10 Floors—*Monolithic Method*—The concrete shall be 1:2:4 mix, using clean, sharp, coarse sand and ⅛ to ¾-in. stone or pebbles and shall be poured between screeds to the finished floor level, carefully straightedged so that no hollows or voids remain. As soon as the surplus water has left the surface, a dust coat, consisting of one bag (100 lb.) "Orthite" No. 10 Gray Metallic Hardener as furnished by the Builders Specialty Company, Inc., Philadelphia, Pa., mixed thoroughly with one bag of portland cement, shall be evenly dusted over the surface of the floor, using this quantity for each 300 sq. ft. of surface. This dustcoat shall be thoroughly floated into the concrete and at the proper time finished off with two steel trowelings, the last troweling to finish the floor smooth and even and free from defects of every kind.

Curing—After 48 hours (not before) the floors are to be covered with 2 in. of non-staining sawdust or sand and kept wet for five days.

Topcoat Method—Install 1:2 mix topcoat and apply "Orthite" No. 10 Gray Metallic Hardener as for monolithic method.

"Orthite" Colored Metallic Hardener

For interior floors only. Has all the advantages of "Orthite" No. 10 and in addition provides the decorative feature of a permanent color. For heavy duty floors where color effect is desired, such as powerhouse, dairy, shop, office and toilet floors. Furnished in red, brown, green, blue, tan and black.

Specification—For either monolithic or topcoat method apply in same manner as "Orthite" No. 10. Finished surfaces shall be protected during construction by applying "Orthite" Anti-Stain and, just before occupancy, the floors shall be waxed with "Colorstone Wax" of matched color.

Liquid Hardener After Treatment "Orthite" No. 14

For hardening and dustproofing cement floors after installed. Floors showing wear and dusting can be hardened and dustproofed by applying "Orthite" No. 14. "Orthite" No. 14 is a colorless liquid compound which is flushed over the floor surfaces and allowed to dry into the pores of the concrete. It forms granite-hard insoluble crystals in the pores, reinforcing the wearing surfaces and practically furnishing the equivalent of a new floor.

No skilled labor is required to apply "Orthite" No. 14. It is recommended for use in practically every type of building where previously described "Orthite" products are not particularly adapted or desired.

Specification—*Note: All floors to be treated must be clean and dry.* All cement surfaces to be hardened shall be flushed with two or more coats of "Orthite" No. 14 Liquid Hardener After Treatment, as furnished by the Builders Specialty Company, Inc., Philadelphia, Pa. The liquid shall be evenly distributed over the surfaces with brooms, the preceding coat to be allowed to dry in before applying the next coat. Not less than one gallon of "Orthite" No. 14 shall be used for each 200 sq. ft. of surface each coat. A sufficient number of coats shall be applied in this manner to harden the surfaces to the entire satisfaction of the architect.

Integral Liquid Hardener "Orthite" No. 8

A colorless liquid which is added to the topcoat mix to harden the topping throughout and produce plain cement floors of exceptionally smooth finish. Makes the topping mix very fat and enables the cement finisher to put a polish on the floor with his trowel, without additional effort or time.

This type of floor is very popular for schools, institutions and similar locations requiring dense, smooth, hard, waterproof, sanitary floors which are easily scrubbed. The cost of "Orthite" No. 8 runs less than one cent per square foot of surface for a one-inch topping.

Specification—The topcoat shall consist of one part cement and two parts clean, sharp, coarse sand. For each bag of cement in the batch, one quart of "Orthite" No. 8 Integral Liquid Hardener, as furnished by the Builders Specialty Company, Inc., Philadelphia, Pa., shall be placed in the drum of the mixer immediately before the aggregates are placed therein. The mixer shall be allowed to revolve a full two minutes before discharging the batch. The topping coat shall be placed in the usual manner, floated thoroughly with wooden floats and at the proper time finished off with two steel trowelings to a smooth and even surface, free from defects of every kind. The floor shall be protected with non-staining sawdust or sand, kept wet for five days thereafter.

BUILDING CHEMICALS CORPORATION

"Chemicals for Building Construction"

51 East 42nd Street, NEW YORK, N. Y.

REPRESENTATIVES AND DEALERS IN PRINCIPAL CITIES

Products

BRIXOPE CONCENTRATED—a brick cleaning compound.

WATERPROOFINGS and DAMPPROOFINGS—integral and surface treatments.

BITUMINOUS COATINGS—for dampproofing and calking.

ACCELERATOR and ANTI-FREEZE COMPOUNDS.

FLOOR HARDENER and SPECIAL FLOOR TREATMENTS.

COLORLESS DAMPPROOFINGS—for face masonry.

DRY FLOOR and MORTAR COLORS.

BONDING COMPOUND.

PLASTER PRIMER.

WOOD PRESERVATIVE POWDER.

Complete Service—Advisory, Research and Contract

(1) Sales engineers and dealers, located at important points—prepared to advise the correct use and application of our materials.

(2) A laboratory—equipped to analyze unusual problems of concrete and masonry construction.

(3) A service organization—trained to supervise or contract for the application of B.C.C. Products.

Note: We service all jobs where our materials are used.

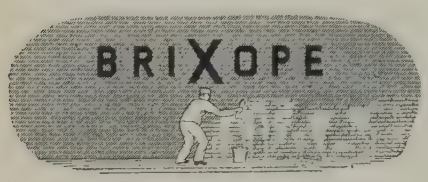
References

A list of installations, or of architects who approve or specify B.C.C. Products, will be furnished on request.

Catalogue

Our catalogue "Chemicals for Building Construction" contains complete information and detailed specifications. Your files should contain a copy of this booklet.

BriXope Concentrated

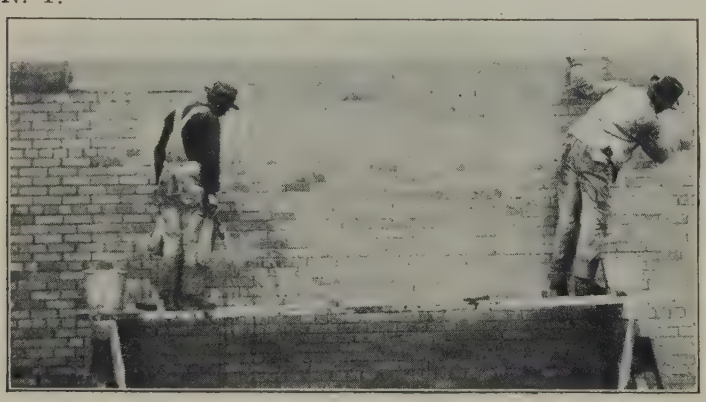


Removes Efflorescence, Cleans Any Ordinary Stain, Waterproofs the Surface

The ideal cleaner for brickwork. Removes efflorescence and gives greater resistance to moisture, without injury to the mortar joint. *All work is performed in one hanging of the scaffold.*

Estimated Cost—BriXope Concentrated does not raise the cost of cleaning a wall 10%. It is easy to apply, enhances the beauty of the wall and preserves the surface. The material cost is about 1¢ per sq. ft.

Specification—Clean down face brick and other masonry with BriXope Concentrated, scrubbing over and wetting each spot twice, in strict accordance with directions of the manufacturer, BUILDING CHEMICALS CORPORATION, New York, N. Y.



Cleaning a Brick Wall

The left side shows the finished surface

B.C.C. Integral Waterproofings (Liquid and Powdered)

For concrete below grade, cement finish and brick mortar. These chemicals are mixed with the gauging water or poured directly into the mixer. (The powdered form requires the addition of water, but goes into solution immediately.)

Result—a dense concrete or mortar, capable of resisting moisture. A lower cost and a lower freezing point due to acceleration of the set.

Estimated Cost—Liquid—$1.00 to $2.00 per cu. yd. of of concrete, labor and material; 1¢ to 1½¢ per sq. ft., labor and material, for cement finish; and $1.00 per thousand brick, labor and material. Powdered—30¢ to 40¢ per cu. yd. of concrete, labor and material; ½¢ per sq. ft., labor and material, for cement finish; and 35¢ per thousand brick, labor and material.

Specification—To all concrete below grade, cement finish and brick mortar, add B.C.C. Integral Waterproofing (specify Liquid or Powdered) in strict accordance with directions furnished by the manufacturer, BUILDING CHEMICALS CORPORATION, New York, N. Y.

B.C.C. Crystal Hardener

A chemical after-treatment for cement finish floors. It hardens the wearing surface, eliminates concrete dusting and protects the floor against disintegration.

Estimated Cost—1¢ to 3¢ per sq. ft., labor and material, depending on texture of the surface and the area to be treated.

Specification—All cement finish surfaces are to be treated with two applications of B.C.C. Crystal Hardener in accordance with directions of the manufacturer, BUILDING CHEMICALS CORPORATION, New York, N. Y.

B.C.C. Oil Waterproofing

A specially prepared waterproofing made up in oil, for mixing with brick mortar *during hot weather.* It prevents efflorescence and leakage.

Estimated Cost—$2.50 per thousand brick, labor and material.

Specification—Add to all brick mortar, B.C.C. Oil Waterproofing in accordance with directions of the manufacturer, BUILDING CHEMICALS CORPORATION, New York, N. Y.

B.C.C. Bituminous Coatings

Mastic (Fibrous Trowel Coating) and semi-mastic (asphalt and fibrous brush coatings, and asphalt paint). Also asphalt emulsions. Extensively used in all building construction for dampproofing, waterproofing and calking—above and below grade.

B.C.C. Colorless Dampproofings (Liquid and Powder)

Protects and preserves exterior concrete, stucco, artificial stone and light faced brick against moisture and dirt.

B.C.C. Accelerator—Anti-freeze (Solution and Powdered)

Speeds up the set of cement and prevents freezing of the mix at low temperatures.

B.C.C. Color Coatings

Furnished in natural, gray, brown, red and green.

Eliminate concrete dusting immediately and give to an otherwise cold-looking surface a warmth and color, rich and high in gloss.

B.C.C. Dry Floor Colors and Dry Mortar Colors

For coloring concrete or cement mortar by integral mixing.

B.C.C. Bonding Compound

For setting cement finish directly on stone or concrete arches. Also for bonding old floors to new.

B.C.C. Plaster Primer

The foundation for the decorative wall coat on important structures and expensive decorations. It hardens the plaster and prepares it for painting.

B.C.C. Wood Preservative Powder

An odorless crystalline chemical which destroys and prevents fungus growth and vermin.

NEW YORK, N. Y.

Services

Waterproofing and Dampproofing Engineers and Contractors, specializing in "Caffall's Scientific Process" of Preserving, Waterproofing and Cleaning all kinds of buildings above grade.

"Caffall's Scientific Process" of Preservation

This process is the standard method of permanently preserving all masonry exposed to the weather, and is recognized as such by government, state and city authorities as well as by the scientists.

The process consists in applying a special preparation of paraffin and chemicals to the exterior walls of marble, granite, brick, terra cotta, stucco, and masonry of all kinds, either old or new. All stone is porous. Moisture penetrates it, especially when accompanied by strong winds. In communities where there is much smoke from factories, etc., carbon soot settles upon the surface and is carried into the pores by the rain. The union of this soot and moisture gives a sulphuric acid solution which quickly causes stone to crumble. Lime salts and frost also cause quick disintegration and are very damaging, especially when moisture is present.

The compound employed in this process is invisible, insoluble and imperishable. It penetrates the material to which it is applied to a depth of ¼ in. or more, depending upon the porosity of the stone, but it is possible to impregnate a brick through its entire thickness. It completely fills all pores or voids, forming an impenetrable barrier to water or moisture and preventing all disintegration.

The preservative used is unaffected by acid and alkali solutions, gases and moisture, and is highly resistent to oxidation. One treatment will last as long as the surface to which it is applied.

"Caffall's Scientific Process" is not an experiment. It has stood the test of time and has an enviable record for durability. Structures treated with it over 50 years ago are still waterproof and in good condition.

Many public buildings of historic interest, as well as churches, monuments, commercial buildings and many private residences have been successfully treated by this process, some of which are:

The Obelisk in Central Park, New York, N. Y.
Fraunces Tavern, Broad Street, New York, N. Y.
The new American Wing of the Metropolitan Museum, New York, N. Y.
Trinity Church, New York, N. Y.
Alexander Hamilton Monument, New York, N. Y.
Christ Church Cathedral, Hartford, Conn.
Buckingham Memorial Fountain, Chicago, Ill.
Residence, I. N. P. Stokes, Greenwich, Conn.
Residence, Carll Tucker, Mt. Kisco, N. Y.
Hotchkiss School, Lakeville, Conn.
Residence, Mrs. Morgan-Hamilton, Sterlington, N. Y.
Hotel Savoy-Plaza, New York, N. Y.

Important Waterproofing Suggestions

There are certain vulnerable parts of the gable walls of buildings, which, if protected against the weather, will go far to insure a dry building. These are the parapet walls. If the average wall is examined, it will be found that the top of the parapet wall is the first part of the masonry to show signs of disintegration and wasting away of mortar joints. If the following specifications are used, the penetration of dampness will be eliminated. North and east exposures are always subject to dampness, but the commencement of the trouble is generally at the top of the building.

Specification Suggestions as Alternate Bid

When "Caffall's Scientific Process" is specified, the furring of walls is unnecessary from the standpoint of weather penetration, and no other form of waterproofing is required. This, with our guarantee, assures the architect and owner of a dry building over a long period of years.

Suggestion No. 1—All exterior walls above grade shall be treated with "Caffall's Scientific Process" for preserving and waterproofing, as applied by Caffall-Cornman Corporation, 225 Broadway, New York, N. Y.

Suggestion No. 2—Brickwork of penthouses, bulkheads, side, rear and fire walls topped with stone, tile or terra cotta from roof flashline over and including the coping, down to the lintel level of the top story windows shall be treated with "Caffall's Scientific Process" for preserving and waterproofing as applied by Caffall-Cornman Corporation, 225 Broadway, New York, N. Y.

Suggestion No. 3—Brick or stone work of chimneys above roof flashing shall be treated with "Caffall's Scientific Process" for preserving and waterproofing as applied by Caffall-Cornman Corporation, 225 Broadway, New York, N. Y.

Guaranteed Results

We guarantee that the masonry (stonework, brick or terra cotta) treated by us with "Caffall's Scientific Process" will not discolor, disintegrate, chip, break, crumble or allow the penetration of moisture or water for a period of twenty (20) years from date of treatment; or should any of the aforesaid defects occur during that period, we will treat same where necessary without charge.

Applying Carey Percoproof Coating to the Outside of Foundation Walls

Experience and Facilities

Established in 1873, THE PHILIP CAREY COMPANY has enjoyed over a half century of continuous growth. Our Waterproofing Engineers are at your command. Complete information, specifications and estimates gladly furnished on request.

Carey Percoproof Coating

A black, liquid, bituminous material which is applied in a cold state, similar to paint, using a long handled brush. This material provides an impermeable dampproofing coat on the outside of foundation walls. The first coat penetrates the cracks and pores of the concrete, brick or stone, even to a depth of several inches.

A second coat fills these pores and adds a film approximately $\frac{1}{64}$ in. thick, building up a dampproofing barrier that will withstand the average conditions of ground moisture encountered around the foundation walls of residences or structures built 8 to 10 ft. below ground level.

Carey Percoproof Coating will dry to a tacky state but will not become brittle, flake or peel, and will respond to expansion or contraction of concrete, brick or stone structures. Covering capacity averages 100 sq. ft. per gallon. Comes ready for use, packed in containers from gallon cans to 50 gallon barrels.

Carey Percoproof Plaster Bond

Applied directly over rough hollow tile or brick upon which the plaster is to be applied without the use of furring or lathing. A thin, black, liquid, asphaltic compound, like thin paint, which penetrates and waterproofs the walls. Applied in single coat in order to keep the original rough surface of the wall so that the plaster will bond satisfactorily to same. Forms a barrier to infiltration (percolation) of dampness and prevents hideous plaster stains and loosening of the plaster wall. Also used on outside of masonry walls prior to stuccoing. Comes ready for use and is applied without heat or the addition of any further solvents.

Carey Plastic Waterproofing Compound

A thick, plastic, asbestos waterproofing cement like putty, applied cold with a trowel to foundation walls for uses similar to Percoproof Coating, except that it will stand moderate hydrostatic (water) pressures of 1 to 10 ft.

Consists of tough waterproofing cements, selected solvents, and asbestos rock fibre. The result being a plastic, fibrous cement that will form a tough, flexible waterproof membrane within 24 to 48 hours.

It is unaffected by the acids and alkalies in ground water. It is permanent, dependable and simple to apply in a cold state using an ordinary trowel. Responds to moderate expansion and contraction without injuring the coating, and will adhere to any rough, smooth, wet, dry, cold or warm surface.

Comes ready for use, packed in 10 to 500-lb. containers.

Carey Waterproofing Primer

Carey Waterproofing Primer is a pure asphalt primer manufactured from natural asphaltic petroleums and well selected solvents. It is a standard product, manufactured to meet the specifications of the American Society for Testing Materials for a primer to use with asphalt in dampproofing and waterproofing below and above ground or water level. It comes ready for use, packed in 3 gallon cans to 50 gallon barrels.

Carey Waterproofing Asbestos Felts

These felts are especially applicable to waterproofing floors in chemical plants and mill construction on account of their acid, alkali and fire resisting qualities.

Made of pure asbestos rock fibre and impregnated with a specially prepared asphalt that makes the felts waterproof, flexible and tough. They contain nothing that will deteriorate or decay.

Carey Waterproofing Fabrics

These materials are made from 100% pure cotton fabrics thoroughly saturated with a flexible asphaltic compound so as to insure an extremely high tensile strength with a reasonable percentage of stretch. They are applicable in waterproof membranes for railroad bridges and other structures where expansion and contraction or vibration are excessive.

Carey Waterproofing Felts

These materials are high grade asphalt saturated rag felts.

A waterproof membrane built up of waterproofing

Continued on next page

felts according to our specification forms a flexible, economical permanent application.

Carey Dampproofing Specification "B"

For Dampproofing the Interior Surfaces of Outside Masonry Walls, Prior to Plastering

(1) Work Included—This specification contemplates furnishing all materials and labor required to properly apply Carey Percoproof Plaster Bond to the interior of all outside brick or masonry walls above ground level, prior to plastering.

(2) Work Not Included—This specification does not include pointing up masonry or plastering and cementing of any kind. All cracks and holes shall be carefully filled with portland cement mortar, prior to applying Carey Percoproof Plaster Bond. Twenty-four hours after applying Carey Percoproof Plaster Bond the plaster may be applied.

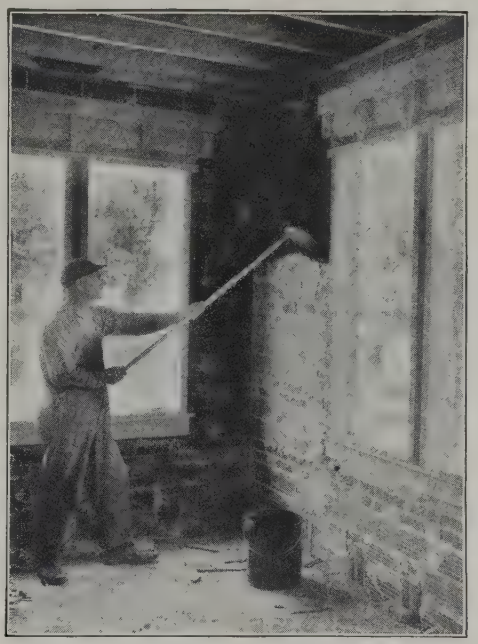
(3) Materials—1 coat Carey Percoproof Plaster Bond, 1½ gals. per 100 sq. ft.

(4) Application—After all cracks and holes have been filled carefully with portland cement mortar and the wall is perfectly dry and free from any foreign matter that would interfere with the penetration or bonding qualities of the dampproofing coat, Carey Percoproof Plaster Bond shall be applied uniformly, with a good bristle brush, to the interior of outside masonry walls from grade level to roof.

In cases where the Carey Percoproof Plaster Bond can not be applied to the walls continuously through the floor construction, it shall be applied back on the ceiling for at least 12 in. from the wall.

Carey Percoproof Plaster Bond shall be applied behind window casings and to all cut-outs and recesses in the wall.

A second coat of about 1 gal. per 100 sq. ft. shall be applied to all very absorbent portions of the wall only.



Applying Carey Percoproof Plaster Bond Prior to Plastering

Carey Dampproofing Specification "C"

For Dampproofing the Outside of Foundation Walls, Concrete Bridges, Abutments, Culverts, Retaining Walls and Other Structures Below Ground Level

(1) Work Included—This specification contemplates furnishing all materials and labor required to properly apply Carey Percoproof Coating to the outside of all foundation walls below ground level.

(2) Work Not Included—This specification does not include pointing up masonry or cementing of any kind. All cracks and holes should be carefully filled with portland cement mortar, and the surface shall be thoroughly cleaned and shall also be smooth and sufficiently dry to obtain good adhesion prior to applying Percoproof Coating. Drain tile may be laid around the footings.

(3) Materials—1 coat Carey Percoproof Coating 1½ gal. per 100 sq. ft.; a second coat Carey Percoproof Coating 1 gal. per 100 sq. ft.

(4) Application—After all cracks and holes have been filled carefully with portland cement mortar, and the foundation wall is perfectly dry and free from any foreign matter that would interfere with the penetration or bonding qualities of the dampproofing coat, Carey Percoproof Coating shall be applied uniformly with a good bristle brush or spraying machine to the outside of foundation walls from footings to ground level.

Not less than twenty-four hours after applying the first coat of Carey Percoproof Coating a second coat shall be applied.

Carey Dampproofing Specification "D"

For Dampproofing the Outside of Foundation Walls, Earth Filled Bridges, Abutments, Culverts, Retaining Walls, and Other Structures Below Ground or Water Level

Work Included—This specification contemplates furnishing all materials and labor to properly apply the dampproofing coat to all outside surfaces below ground or water level.

Work Not Included—For this specification the excavation should be made at least 2 ft. beyond the foundation wall line, to permit a man working room for application of the dampproofing coat to the outside of the foundation walls.

Pointing up masonry or cementing of any kind is not included. All cracks, holes and voids should be carefully filled with portland cement mortar and the surface shall be thoroughly cleaned and shall also be smooth and sufficiently dry to obtain good adhesion prior to applying the primer and asphalt.

Earth backfilling may be started twenty-four hours after the last coat.

Drain tile may be laid around the footings.

Materials—(a) 1 coat Carey Waterproofing Primer—(1½ gal.) 14 lb. per 100 sq. ft.

(b) 1 coat Carey Dampproofing Asphalt No. 113—(6 gal.) 54 lb. per 100 sq. ft.

Application—After all cracks, holes and voids have been filled carefully with portland cement mortar, and the wall is perfectly dry and free from any foreign matter that would interfere with the penetration or bonding qualities of the primer, the Carey Waterproofing Primer shall be applied uniformly with a good bristle brush, using at least 1½ gal. for each one hundred square feet.

When the primer has dried to a slightly tacky state it is ready for the asphalt coat.

Carey Dampproofing Asphalt, No. 113, shall be heated to about 250° F. to 300° F. in a kettle. From there it shall be transferred to large buckets and mopped on the primed surface using a minimum of (6 gal.) 54 lb. for every 100 sq. ft.

Carey Specification No. 31

For Waterproofing Outside Foundation Walls Below Ground Level and on Underbed of Basement Floor

(1) Work Included—This specification contemplates furnishing all materials and labor to properly apply Carey Waterproofing Compound to the foundation walls below ground level and underbed of basement floor.

(2) Work Not Included—For this specification the excavation should be made at least 2 ft. beyond the foundation wall line, to permit a man working room for application of the waterproofing compound to the outside of the foundation walls.

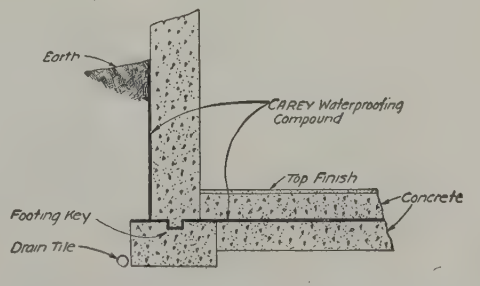
Pointing up masonry or cementing of any kind is not included. The foundation walls, whether masonry or concrete, should be placed immediately on the fresh waterproofing compound applied to the footings. The waterproofing compound on the foundation walls shall be permitted to dry for 48 hours before back filling with earth, and then back filling should be done very carefully in order not to injure the membrane. The underbed of the basement floor shall be made by the cement contractor and shall consist of 1 in. thick concrete well tamped and leveled off.

(3) Materials—Carey Waterproofing Compound ⅛ in. thick on foundation walls—approximately 80 lb. per 100 sq. ft. Carey Waterproofing Compound ¼ in. thick on underbed of basement floor and footings—approximately 160 lb. per 100 sq. ft.

(4) Application—***Footings***—Carey Waterproofing Compound shall be smoothly troweled ¼ in. thick on all footings.

Foundation Walls—A smooth trowel coating of Carey Waterproofing Compound shall be applied to the outside of all foundation walls below ground level. This coating shall be approximately ⅛ in. thick and at no place shall the wall appear uncovered.

Basement Floor—In waterproofing the basement floor Carey Waterproofing Compound shall be applied ¼ in. thick to the underbed. It shall be troweled over small areas and the concrete for the finished floor applied immediately by cement contractor, so that no hauling or tramping is done in waterproofing compound.



Cross Section Showing Application of Carey Waterproof Compound. Specification No. 31

Continued on next page

Carey Waterproofing Specification No. 32

For General Waterproofing

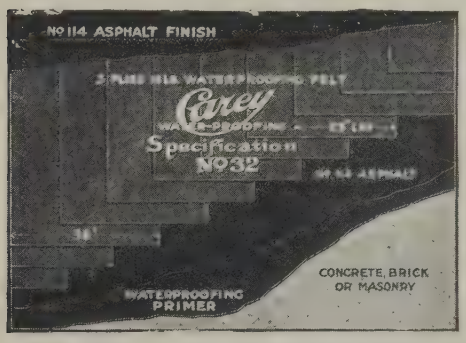
(1) Work Included—This specification contemplates furnishing all materials and labor to properly apply the built-up waterproof membrane to (state here surfaces to be waterproofed) below ground or water level.

(2) Work Not Included—This specification does not include pointing up the concrete, brick, stone, tile, masonry or cementing of any kind. All cracks, holes and voids shall be carefully filled with portland cement mortar. The surface shall be thoroughly clean and shall also be smooth and sufficiently dry to obtain good adhesion prior to applying the Primer.

(3) Materials—Carey Waterproofing Primer (1 gal.) 9 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 50 lbs. per 100 sq. ft.; Carey Waterproofing Felt, 15 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey Waterproofing Felt, 15 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey Waterproofing Felt, 15 lbs. per 100 sq. ft. and Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft. Total approximate weight per 100 sq. ft. to be 179 lbs.

(4) Application—Carey Waterproofing Primer shall be applied uniformly and thoroughly brushed in. When the primer has dried to a slight tacky state the surface shall be mopped with Carey Waterproofing Asphalt No. 114, into which, while still hot, shall be embedded the first sheet of Carey Waterproofing Felt. The successive sheets of felt shall overlap the previous sheet 25 in., making eight courses of asphalt and felt, including the primer. All the sheets of felt shall be solidly cemented together with asphalt so that at no place shall felt touch felt.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt No. 114 applied hot, into which shall be embedded one thickness of 15-lb. Carey Waterproofing Felt cut to extend at least 6 in. each way from the angle. Two such sheets shall be applied—one immediately after applying the primer, and another after the membrane is completed.



Carey Waterproofing Applied to Outside Walls and Underbed. Specification No. 32

Application of Carey Membrane System of Waterproofing Specification No. 34

Application of Carey Membrane System of Waterproofing Specification No. 35

Carey Waterproofing Specification No. 33

For Waterproofing Floors in Mill Construction, Alkali, Acid and Fire Resistant

(1) Work Included—This specification contemplates furnishing all materials and labor to properly apply the built-up waterproof membrane to the wood floors in mill construction.

(2) Work Not Included—All knotholes and open cracks shall be tightly sealed. The floor shall be made free from splinters and nails before applying the waterproofing. Over the membrane shall be laid a second flooring and the flashings on the walls shall be covered with baseboards.

(3) Materials—Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey 35-lb. Waterproofing Asbestos Felt, 35 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey 15-lb. Waterproofing Asbestos Felt, 15 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey 15-lb. Waterproofing Asbestos Felt, 15 lbs. per 100 sq. ft. and Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.

(4) Application—The clean dry base floors shall be mopped with Carey Waterproofing Asphalt No. 114, into which, while still hot, shall be embedded sheets of 35-lb. Carey Waterproofing Asbestos Felt lapped 2 in. Over this shall be applied 2 plies 15-lb. Carey Waterproofing Asbestos Felt overlapping one another 19 in. and also embedded in hot asphalt No. 114.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt No. 114 applied hot, into which shall be embedded one thickness of 35-lb. Carey Waterproofing Asbestos Felt cut to extend at least 6 in. each way from the angle. Two such sheets shall be applied—one prior to applying the first sheet, another after the membrane is completed. A finishing coat of Carey Waterproofing Asphalt No. 114 shall be applied over the entire membrane.

Carey Waterproofing Specification No. 34

(1) Work Included—This specification contemplates furnishing all materials and labor to properly apply the built-up waterproof membrane to (state here the surfaces to be waterproofed) below ground level.

(2) Work Not Included—Proper excavation or other provision must be made to permit working room for applying the membrane.

Pointing up masonry or cementing of any kind is not included. All cracks, holes and voids should be carefully filled with portland cement mortar, and the surface shall be cleaned and shall also be smooth and dry prior to applying the waterproof membrane. A cement mortar or brick protection shall be placed over the waterproofing for best results.

(3) Materials—Materials used in the construction of the waterproofing shall be as follows:

Carey Waterproofing Primer (1 gal.), 9 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 50 lbs. per 100 sq. ft.; Carey Fabricated Membrane, 40 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft.; Carey Fabricated Membrane, 40 lbs. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lbs. per 100 sq. ft. Total approximate weight per 100 sq. ft. to be 189 lb.

(4) Application—Carey Waterproofing Primer shall be applied uniformly and thoroughly brushed in. When the primer has dried to a slight tacky state the surface shall be mopped with Carey Waterproofing Asphalt, No. 114, into which, while still hot, shall be embedded the first sheet of Carey Fabricated Membrane. The second sheet of Fabricated Membrane shall overlap the previous sheet 19 in., making six courses of asphalt and Fabricated Membrane including the primer. Both sheets of Fabricated Membrane shall be solidly cemented together with asphalt, so that no place shall membrane touch membrane.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt, No. 114, applied hot, into which shall be embedded one thickness of Carey Fabricated Membrane cut to extend at least 6 in. each way from the angle. Two sheets shall be applied. One immediately after applying the primer and another after the membrane is completed.

Carey Waterproofing Specification No. 35

For Waterproofing Bridges and Structures Where Expansion and Contraction Are Excessive

(1) Work Included—Use paragraph 1 Specification No. 32.

(2) Work Not Included—Use paragraph 2 Specification No. 32.

(3) Materials—Carey Waterproofing Primer (1 gal.), 9 lb. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 50 lb. per 100 sq. ft.; Carey Heavy Waterproofing Fabric, 11 lb. per 100 sq. ft.; Carey Waterproofing Asphalt No. 114, 25 lb. per 100 sq. ft.; Carey Heavy Waterproofing Fabric, 11 lb. per 100 sq. ft. and Carey Waterproofing Asphalt No. 114, 25 lb. per 100 sq. ft.

(4) Application—Carey Waterproofing Primer shall be applied uniformly and thoroughly brushed in. When the primer has dried to a slight tacky state the surface shall be mopped with Carey Waterproofing Asphalt No. 114, into which, while still hot, shall be embedded the first sheet of Carey Heavy Waterproofing Fabric.

The second sheet of Carey Waterproofing Fabric shall overlap the previous sheet 19 in. and also be embedded in hot asphalt No. 114 so that at no place shall fabric touch fabric.

Reinforce all angles at corners, walls, etc., by cementing with Carey Waterproofing Asphalt No. 114 applied hot, into which shall be embedded one thickness of Carey Waterproofing Fabric cut to extend at least 6 in. each way from the angles. Two such sheets shall be applied—one immediately after applying the primer and another after the membrane is completed. A finishing coat of Carey Waterproofing Asphalt No. 114 shall be applied over the entire membrane.

CELITE PRODUCTS COMPANY

CELITE PRODUCTS LIMITED, New Birks Building, Montreal, Que.
CELITE PRODUCTS CORP., 147 Windsor House, Victoria Street, Westminster, London, England

Products

CELITE, a Workability Agent for Concrete.
SIL-O-CEL HIGH TEMPERATURE INSULATING MATERIALS.
Also Filter-Cel and Super-Cel Aids to Filtration.

Celite

Celite is a dry powder composed of extremely fine particles of amorphous silica. Added to a concrete mixture with the other dry materials it stabilizes the mass, holding the portland cement, water, sand and coarse aggregate in the same relation to each other throughout handling and placing as when they left the mixing drum.

Improved Workability—The first benefit of Celite in a concrete mixture is improved workability. It obviates the use of excess mixing water and makes it possible to successfully place concrete of drier consistencies in mass structures or in intricate forms, without danger of honeycombing or segregation.

What Improved Workability Means—(1) It results in quicker and cleaner discharge.

(2) The concrete can be placed with less labor and manipulation.

(3) The concrete will flow into place in the forms around intricate reinforcing, completely filling all corners and recesses.

(4) Relatively dry concrete can be satisfactorily handled by chutes without the need for excess water.

(5) In cases where central mixing is employed no segregation will be encountered in transit from the mixer to the job, and difficulties in dumping from trucks will be eliminated.

Uniformity and Strength—Segregation is the principal cause of non-uniformity in a concrete structure. It can be absolutely overcome through the correct use of Celite, so that the minimum strength (which is in fact the effective crushing strength of the concrete) is greatly increased.

A higher average strength also is made possible since concrete containing Celite can be placed with a lower slump, ordinarily, than would otherwise be used.

Water-tightness—Celite provides integral water-tightness in concrete in which it is used—a result of improved uniformity and decreased void sizes.

Amount of Celite Necessary—The quantity of Celite which should be used to secure best results varies with the mix. Harsh aggregates may require a slight increase over the amounts specified. In any case, however, the amount of Celite constitutes only a very small proportion of the entire mixture.

AMOUNT OF CELITE RECOMMENDED

Concrete mix	Economic limits per bag of cement	Average recommendations per bag of cement
1 : 1½ : 3	1½–3 lb. Celite	2 lb. Celite
1 : 2½ : 3½	2 –4 lb. Celite	3 lb. Celite
1 : 2 : 4	2 –4 lb. Celite	3 lb. Celite
1 : 2½ : 5	3 –6 lb. Celite	4 lb. Celite
1 : 3 : 6	4 –8 lb. Celite	5 lb. Celite

Increased Yield—The cost of Celite in many cases is repaid alone by the increased yield of finished concrete in place. In a 1:2:4 mix, for example, the use of 3 lb. of Celite per bag of portland cement ordinarily results in an increase in the yield of finished concrete of approximately 5 per cent.

1:2:3½ Concrete Containing 3 lb. of Celite per Bag of Cement
Slump 3 in. Note extreme workability and freedom from segregation

Method of Use—No changes of equipment or in methods of mixing or placing concrete are involved in the use of Celite. This powdered material is simply added with the other dry ingredients at the mixer. The mix is handled in the usual manner. No more water is added to a concrete mix containing Celite than is necessary to give an equal or lesser slump than would be secured with plain concrete.

Standard Specifications—Celite shall be used in all concrete in the proportions set forth below for the different concrete mixtures.
... : ... : ... concrete ... lb. per bag of cement
... : ... : ... concrete ... lb. per bag of cement.
The Celite may be measured by a pre-determined volume in such a manner as will insure the correct proportion by weight, and shall be added at the mixer with the dry materials.

Only sufficient water shall be used to give a workable consistency and in no case shall more water be added than will give a slump of ... in.

Sil-O-Cel Insulating Materials

For the insulation of all types of boilers and auxiliary heating and power plant equipment, Sil-O-Cel is provided in the form of brick, block, powder, plastic and hard finish cements and coarse aggregate (C-3) for making insulating concrete.

Building walls, partitions and roofs are ordinarily insulated and sound deadened with a filling of Sil-O-Cel Coarse Grade Powder.

Sil-O-Cel Standard Insulating Brick—Recommended for insulating service behind the refractory or over steel surfaces where direct temperatures will not exceed 1600° F.

Sil-O-Cel C-22 Insulating Brick—These brick are free from shrinkage at direct temperatures as high as 2000° F.

Sil-O-Cel Super Brick—Semi-refractory, withstand direct temperatures up to 2500° F. without shrinkage or deterioration.

Mortar for Laying Sil-O-Cel Brick—This is included with each shipment. The brick are well packed in cartons of 25 for convenience in storage and handling.

Insulating Powder and Coarse Grade Insulation—Used as an insulating filler in hollow walls and over the tops of heated equipment.

C-3 Aggregate—A coarsely ground calcined material used as an insulating filler in hollow walls or bases where temperatures behind the refractory run as high as 2000° F. Weight in place, 31 lb. per cu. ft. Four parts of C-3 mixed with one part by volume of portland cement make an insulating concrete of great durability, which weighs when dried, only 60 lb. per cu. ft.

Insulating Cements—"Plastic" and "Hard Finish," made with Sil-O-Cel, are provided for covering irregular surfaces where insulating brick could not be conveniently used.

Insulating Blocks—Made of Sil-O-Cel and long fibered asbestos, are supplied in 6 and 12-in. widths, lengths of 18 and 36 in., and thicknesses of 1, 1½, 2, 3 and 4 in.

Celite Engineering Service

Celite Engineering Service is freely available at every office of the Company to co-operate toward the solution of any problems relative to the proportioning and placing of concrete, or the insulation of buildings or heated equipment.

CERESIT WATERPROOFING CORPORATION

Waterproofings, Dampproofings, Floor Hardeners, Protective Coatings

512-514 South Canal Street
CHICAGO, ILL.

Products

CERESIT WATERPROOFING COMPOUND.
CERESIT WATERPROOFING POWDER.
CRESOLAC TRANSPARENT WATERPROOFING.
CERESIT METALLIC HARDENER.
INDURITE LIQUID HARDENER.
CRAXEMENT CONCRETE REPAIR COMPOUND.
CRESCRETE ACCELERATOR and FROSTPROOFING.
CEROX COLORED CEMENT.
CERETONE CEMENT COLORING PIGMENT.
CEM-BRIC WATERPROOF PAINT.
CERESIT ASPHALTIC DAMPPROOFING.
CERESIT ASPHALTIC PLASTER BOND.

Service

Advisory engineering service available on waterproofing or concrete surfacing problems.

Literature

Bulletins describing materials and containing complete data sent on request.

Ceresit Waterproofing Compound

(a) An integral waterproofing in paste form.
(b) To be added to portland cement mixtures at the time of mixing.
(c) Its use increases workability.
(d) Reduces labor costs in placing.
(e) Permits reduction in water content without loss in plasticity.
(f) Densifies and permanently waterproofs concrete, cement stucco and cement plaster.

Requirements—For mass concrete, use 8 lb. per cu. yd. For portland cement plaster, use 2 to 3 lb. to each sack of cement. For portland cement stucco use 2 to 3 lb. to each sack of cement.

Standard Specification—All concrete [cement plaster] [cement stucco] shall be waterproofed by the addition of Ceresit Waterproofing Compound, an integral waterproofing, manufactured by CERESIT WATERPROOFING CORPORATION, Chicago, which shall be used in accordance with the manufacturer's directions.

Ceresit Waterproofing Powder

An integral waterproofing in powder form. Added to concrete at the time of mixing. This material performs the same function as Ceresit Waterproofing Compound.

Requirements—Use 2 to 3 lb. to each sack of cement. Mix dry with cement before adding water or aggregates to batch.

Cresolac Transparent Waterproofing

A transparent liquid applied with a brush or spray to concrete, brick or other masonry for protection against penetration of water or moisture. This material penetrates the surface pores and makes the treated surface water repellent. It does not affect or change the original color. It is particularly effective on concrete block or tile.

Covering Capacity—Two coats required. 1 gal. covers 200 sq. ft., 2-coat work.

Crescrete Accelerator and Frostproofing

For accelerating the set of portland cement and protection against freezing at low temperatures. Also of value as an integral hardener and waterproofing agent.

Ceresit Metallic Hardener

A finely ground and graded metallic compound for incorporation in the top of wearing course of concrete floors. This material is particularly well adapted for heavy duty floors, producing a surface which is dustless and extremely dense and hard. It is furnished in gray or red.

Requirements—25 to 35 lb. to each 100 sq. ft., depending on traffic conditions.

Indurite Liquid Hardener

A colorless liquid for application to concrete floor surfaces. This material greatly increases hardness, and eliminates dusting. The treatment is made in two applications.

Requirements—1 gal. will treat 100 sq. ft.

Craxement Concrete Repair Compound

A special quick-setting repair cement for permanently repairing cracks, holes, breaks and worn spots in concrete floors. It bonds securely to old concrete and produces a hard, dense surface of high strength and wearing quality.

Cerox Colored Cement

A colored waterproof portland cement for use wherever colored concrete surfaces are required. Used in the same manner as standard portland cement. Made in a variety of colors. Eliminates measuring and mixing of colors and cement on the job.

Ceretone Cement Coloring Pigment

Ceretone densifies, hardens, waterproofs and colors cement mixtures. Its greatest use is for colored cement floors. It provides an attractive floor surface which is durable both as to service and permanence of color.

Ceretone colors are red, brown, buff, green and black.

It is shipped in 20 and 100-lb. containers.

Cem-Bric Waterproofing Paint

A specially prepared paint for use on concrete, brick and masonry surfaces. Dries to dense and hard surface.

Ceresit Asphaltic Dampproofing

A heavy asphaltic paint for application on foundations of concrete, brick, or other masonry, below grade, to protect against dampness or surface water. It is also used for a primer and cement coat for membrane waterproofing.

Covering Capacity—For 1-coat work, 1 gal. will cover 60 to 70 sq. ft. For 2-coat work, 1 gal. will cover 40 to 50 sq. ft.

Ceresit Asphaltic Plaster Bond

A heavy asphaltic compound for application to the inside surfaces of outer or exposed walls on which plaster is to be applied. This material prevents injury to the plaster from dampness.

Covering Capacity—For 1-coat work, 1 gal. will cover 60 to 70 sq. ft. For 2-coat work, 1 gal. will cover 40 to 50 sq. ft.

CONTRACT WATERPROOFING CO.

Services

We are ENGINEERS and CONTRACTORS for the perfect WATERPROOFING, OILPROOFING, FROSTPROOFING or FUMEPROOFING of any structure of concrete, brick, tile or stone.

Ferro-Tite Method

Ferro-Tite, the iron method of waterproofing, is used in the performance of all of our contracts.

The surfaces are first thoroughly prepared, after which sufficient coats of Ferro-Tite are applied to secure the desired results.

The first coat penetrates the concrete and, on oxidation, expands and perfectly seals all pores of the concrete.

The succeeding coats form a solid sheet of oxidized iron on the surface. After these coats have thoroughly set, slush coats of sand and cement containing Ferro-Tite are applied, which restores the surface to the color of ordinary concrete.

Plaster may be applied directly to this surface, or it may be painted over.

Specifications

Walls—The following surfaces.....shall be waterproofed by the application of Ferro-Tite, the iron method of waterproofing as applied by the CONTRACT WATERPROOFING CO.

Floors—All floors resting on earth shall be waterproofed by the application of Ferro-Tite, the iron method of waterproofing as applied by the CONTRACT WATERPROOFING CO.

This contractor shall apply his material to the top of the rough slabs for these floors, after which others shall at once apply the finish topping.

USE FERRO-TITE METHOD

Guarantee

We will guarantee any surfaces waterproofed by us to be waterproof and dampproof for a period of ten years, subject to causes beyond our control, such as fractures in walls, etc.

Resistance to Hydrostatic Pressure

Although we prefer to, and usually do, apply Ferro-Tite to the inner surfaces of exterior walls, etc., it will withstand any pressure of water that the walls can withstand. This is also the case where Ferro-Tite is applied to the outside of exterior walls.

Engineers, Architects and Contractors

Write for our handbook on structural waterproofing, which contains valuable information, suggestions and hundreds of references from the foremost architects, engineers and contractors in the country.

Our reputation as waterproofers is based on accomplishment.

CONCRETE SURFACE CORPORATION

"Surfacing Concrete for Bond or Appearance"

342 Madison Avenue
NEW YORK, N. Y.

FACTORY AT CLEVELAND, OHIO
REPRESENTATIVES IN PRINCIPAL CITIES

What Con-Tex Does

Con-Tex, in its several forms and usages, makes concrete a new and better medium for construction and for architectural expression. Through the agency of Con-Tex, concrete becomes more than a material of structural utility alone and lends itself to manifold new uses, to better uses and with new advantages in economy.

LICENSED UNDER PRODUCT AND PROCESS PATENT RIGHTS OF NATHAN C. JOHNSON, IN U.S.A. AND ABROAD

How Con-Tex Acts

Con-Tex is applied to concrete either by brushing it on forms before concrete is cast and allowing it to dry, or by brushing or spraying it on the fresh surface of concrete, as in top surface work.

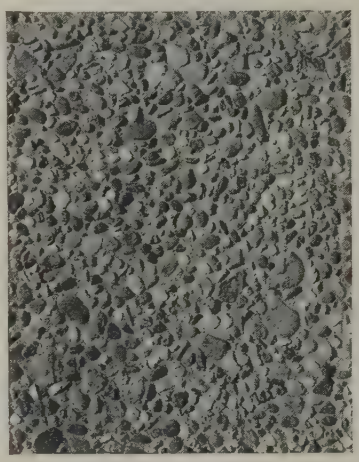
During the hardening of the concrete, this Con-Tex keeps the surface layer of cement and sand from setting, so that this surface layer may be easily removed by wire brushing when the body concrete has hardened.

Con-Tex neutralizes and stops the setting action of a surface film of cement only. The action stops entirely at the predetermined depth and there is no partially set material.

This unset material when brushed or washed off leaves a surface of cleanly exposed stone and sand.

Con-Tex has no action on concrete that has already hardened.

The labor cost of using Con-Tex, both for applying Con-Tex and for brushing away the unset material, should not exceed ⅝¢ per sq. ft. at the highest. The material cost of Con-Tex depends on the quantity purchased, but should not exceed 2¾¢ per sq. ft., without job overhead or profit.



A Typical Con-Texed Surface on Cast Concrete

Types of Con-Tex

There are three types of Con-Tex and the following different strengths:

(1) Form Con-Tex, a liquid, varnishlike material—applied to wood, metal or other forms. This is manufactured in four grades or strengths—light, medium, heavy and bonding. All grades dry quickly and when dry are quite impervious to weather.

(2) Top Surface Con-Tex, a creamy liquid—applied directly to the surface of freshly placed concrete. This is also manufactured in four grades—light, medium, heavy and bonding. This is used for preparing the surfaces of underslabs to receive topping; for ornamental work on plaza areas, roadways, sidewalks, etc.

(3) Stucco Con-Tex—a creamy liquid. Applied to the surface of freshly troweled stucco to reveal the aggregate and to prevent cracking of the stucco. It also exerts a strongly curative effect on the stucco. Dries slowly and is not impervious to weather. Furnished in one strength only, except for special requirements.

Con-Tex Fabric

A preshrunk, impregnated fabric, fastened to the inside surfaces of forms. Must be stretched tightly and fastened securely with staples or nails and tin washers every 4 in., or with our special fasteners. Can be used on wood forms only. Regular fabric produces shallow, checkerboard indentations in the concrete, but does not remove form skin or laitance. These impressed indentations furnish a mechanical bond only and do not reveal sand or stone.

The material cost of regular Con-Tex Fabric is about the same as for the liquid

Continued on next page

Con-Tex Surfaced Gateway and Fence, Estate of Maynard D. Smith, Port Huron, Mich.
Leslie G. Larkin, Architect, Detroit, Mich.
Note the effect secured by using Con-Tex

Con-Tex. The labor cost of using Con-Tex Fabric is indeterminate, depending on the nature of the operation and the skill and care of the users.

Special Con-Tex Fabrics can be supplied which will produce the full revealed stone, just as Con-Tex produces it, but the ordinary fabric is designed to produce a mechanical lock only.

Use of Con-Tex to Secure Architectural Textures on Cast Concrete Surfaces

Architectural textures, varied by the selection of aggregates, are easily produced on concrete poured in forms by coating the forms with Form Con-Tex before the concrete is placed.

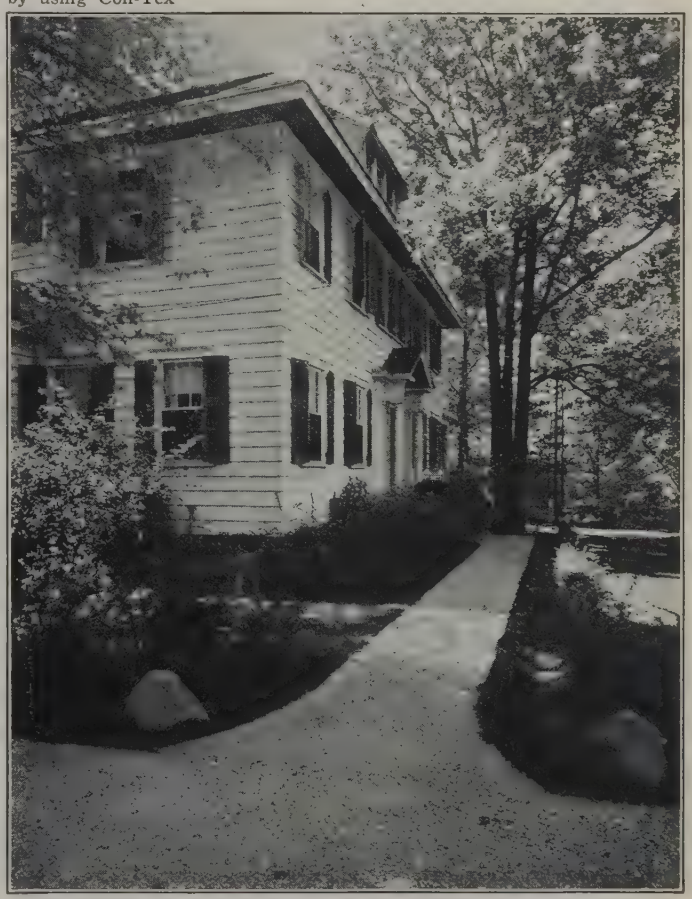
A certain care must be exercised in selecting aggregates for such work, and in placing the concrete. Naturally, fine aggregates produce a more even texture, while coarse aggregates give a more rugged relief. The use of Form Con-Tex removes from the concrete surfaces all trace of the usual dull, uninteresting, flat "form skin" and reveals the colorful aggregates, producing a surface texture of architectural character and permanence.

Send for our Bulletin No. 1, which illustrates and describes the use of Con-Tex to produce architectural textures on form cast concrete.

Con-Tex for Architectural Textures on Plazas, Areas, Driveways, Sidewalks, and other Horizontal Areas

Architectural textures, non-slip surfaces, etc., are easily obtained on horizontal planes by the use of Top Surface Con-Tex, which is sprayed on after the concrete has been finished to a level.

Further information, specifications, etc., may be obtained by writing for our Bulletins Nos. 1 and 4.



Con-Tex Surfaced Driveway and Walk, Residence of Nathan C. Johnson, Englewood, N. J.

Continued on next page

Con-Tex Bonding Surfaces on Concrete

"All cementitious materials will unfailingly bond to clean sand and clean stone." Success in bonding is easy, once this fact is known and recognized, for right beneath the "form skin" of concrete are clean sand and clean stone in quantity, and it only remains to uncover this perfect bonding surface.

Acid washing, thorough hacking of the surfaces, bush hammering and power tooling of various kinds have long been attempted methods of securing a bond surface but usually prove either unpleasant, slow or costly, or have all three disadvantages.

Con-Tex, supplied either to the surfaces of the forms before the concrete is poured, or sprayed on after the slab is placed but not set, provides a method both economical and efficient for all classes of concrete.

When concrete is thus treated with Con-Tex certain "active" elements are slowly fed from the Con-Tex into the surface film of concrete and stop the "set" of a thin surface layer of the concrete. This action is so controlled that it obtains to a definite and predetermined depth and no further. Con-Tex has no effect on hardened concrete.

Forms are removed as usual when the mass of concrete has hardened. Then the thin surface film of unset concrete produced through the action of Con-Tex is brushed off with wire brushes, thus exposing or "revealing" the aggregates ordinarily hidden beneath the "form skin." In top surface work the unset film is broomed away with wire brooms.

It is this revealed aggregate surface that constitutes the bonding surface which unites so perfectly with new cement, mortar, plaster or other materials of similar character in a secure and permanent bond of full strength.

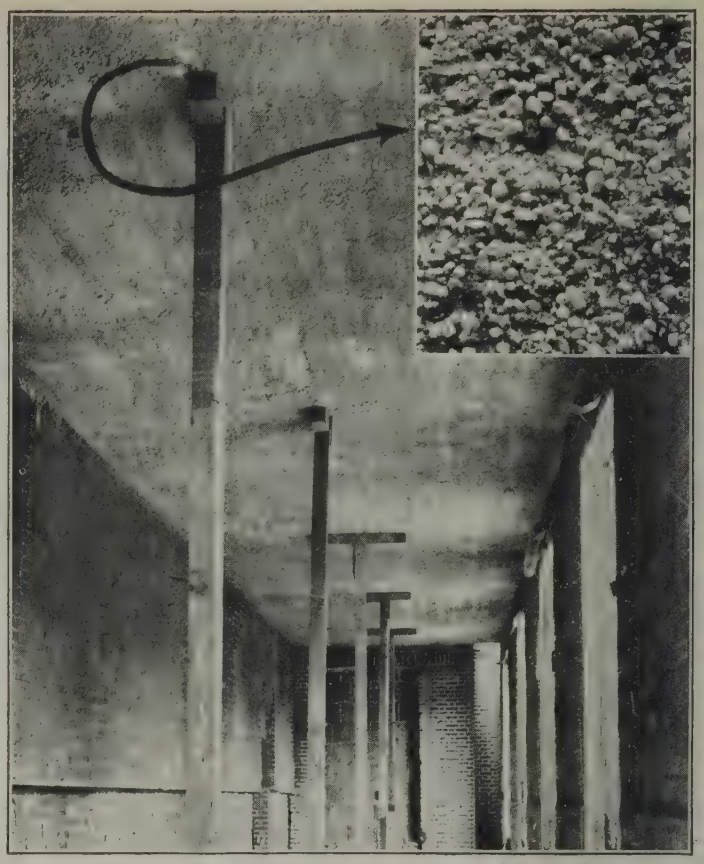
This Con-Tex "Interlok Bond" surface provides a sure method for bonding together the various sections of monolithic work, for bonding tile, brick, etc., to vertical walls, bonding stucco to a concrete base, and for bonding the floor finish to the rough slab.

The whole process is simple, economical and sure. Many millions of square feet of concrete surfaces are treated in this way each year and the demand for Con-Tex is constantly increasing.

Send for our Bulletin No. 2 for further details regarding the use of Con-Tex to produce bonding surfaces.

Plaster Bond Surfaces on Concrete

Plastered ceilings—with many thousands of pounds suspended overhead—must be made assuredly secure. With Form Con-Tex Bonding Grade specified, ceilings and walls have a clean stone bond surface which automatically assures lasting satisfaction because of the true union of the exposed stone surfaces of the concrete with the plaster finishes applied thereafter.



Garden City High School, Garden City, L. I.
Permanent plaster bond on Con-Texed concrete
Starrett & Van Vleck, Architects

Floor and Other Top Bond Surfaces

Top Surface Con-Tex is sprayed or brushed on after the rough slab has been screeded and before the concrete takes its initial set. After the body of the concrete has set, the loosened surface layer is removed by wire brooms. Bonding the top surface to the slab beneath makes sure a permanent, satisfactory floor and credit may be obtained in most codes for the topping as an integral and permanent part of the slab.

Permanently Beautiful Stucco Effects Secured Through the Use of Con-Tex

Concrete is structurally excellent, but stucco over concrete, to be permanently satisfactory must be so thoroughly bonded to a concrete surface as to become an integral part of the concrete. To secure this bond it is absolutely essential that the stucco be allowed to bond (as it will, unfailingly and permanently) to a clean sand and clean stone surface such as is produced by the use of Con-Tex. By this proven method of construction the stucco becomes as permanent as the concrete itself.

Unless such a bond is obtained between the stucco and the concrete, early loosening will result, followed sooner or later by the scaling and peeling of the stucco. But by means of Bonding Con-Tex a full-area bonding surface of clean sand and clean stone is obtained. To this rough, clean-stone Con-Texed surface stucco will bond in a firm and lasting union—so strong that even hammer blows, repeated to the point where the stucco and the concrete beneath are *pulverized,* will not loosen one material from the other.

Write for our Bulletin No. 5.

Revealing Color and Texture in Stucco by Stucco Con-Tex

The possibilities of stucco finishes over concrete, once a bond is furnished by Bonding Con-Tex, are limited only by creative and artistic ability, for another variety—Stucco Con-Tex—comes forward at this point to play its part.

Stucco Con-Tex is sprayed or brushed on the stucco after screeding and floating, to remove an exceedingly thin layer, just sufficient to give a slight reveal to the aggregates which have been incorporated in the stucco.

In this way stucco can have a permanent color, without resort to mortar colors for the sole effect, although mortar colors may be used where desired, and a texture as well.

Revealed stucco over Con-Tex bond-surfaced concrete provides permanent, colorful and architecturally beautiful construction. Our Bulletin No. 5 furnishes further information.

Southampton Beach Club Swimming Pool, Southampton, L. I., N. Y.

Peabody, Wilson & Brown, Architects

Other Specific Applications of Con-Tex Bonding Surfaces on Concrete

Brick Veneer and Tile—Con-Tex produces so satisfactory a bond that brick veneer can be bonded to concrete without the use of metal ties.

Tile, when set against or laid on a Con-Texed surface, are permanently locked to the base.

Concrete Steps—Bonding the top surface to the rough cast concrete through the use of Con-Tex eliminates cracking off and peeling away of the finish coat from the structural concrete.

Swimming Pools—When sides and floors of swimming pools are treated with Con-Tex, a sure bond for the tile or mortar or stucco sidewalls and floors results. This has become standard for pool construction.

Pouring Planes to Pouring Planes—Disintegration of concrete at and near pouring planes in such structures as dams, reservoirs, tanks, swimming pools, bridges and every other kind and class of structure, causes serious trouble. Con-Texed surfaces produce non-leaking, permanently tight joints which are both chemically and mechanically an integral part of the mass.

No. 60, Des Moines Elaterite for Waterproofing and Bonding; No 65, Des Moines Elaterite for Stone Backing.

Also manufacturers of Preservative Paints for all classes of surfaces, including Acid and Heat Resisting Paint; and Metal Protective Paint.

DES MOINES ELATERITE

TRADE-MARK

No. 60, Waterproofing and Bonding

No. 60, Des Moines Elaterite, is both a waterproofing and a bonding material. Its base is an intensely adhesive, extremely elastic, non-porous, acid resisting, absolutely waterproof hydro-carbon known as "mineral rubber." It seals the pores of concrete, cement, brick, tile or stone, destroys capillary attraction and provides a continuous film which completely shuts out dampness. In addition, its intensely adhesive quality makes it an ideal bonding material, permitting the direct application to it of plaster or stucco coats.

Applying Plaster Coat Directly to "Des Moines Elaterite" Waterproofing and Bonding Coat

Uses—For waterproofing all brick, stone, concrete and cement surfaces and as an integral waterproofing to be mixed in concrete or cement mortars, plaster, floor and roof toppings and stucco, and for bonding plaster, stucco, tile, linoleums, etc.

Advantages—Intensely adhesive, permanent character; extreme resistance to all acids, preventing disintegration; permanent pliability and elasticity, preventing breaking of the waterproof film from hair cracks or expansion and contraction; smooth liquid character, providing a continuous, rubbery blanket; absolute waterproof character, sealing the surface against passage of dampness; combination of waterproofing and bonding, permitting doing away with lath or furring, economizing room and saving in labor and material costs. It meets every waterproofing requirement, thus there is no need to specify a different material for outside foundations, inside walls, basement floors or bonding or integral waterproofing.

Application—Applied cold, it spreads rapidly with broad flat brushes or may be applied with an air gun or spray. No hot swabbing or layers of felt required and any workman can apply it.

Covering Capacity—100 to 150 sq. ft. (one coat) per gal. or from 80 to 100 sq. ft. (two coats) on cement, brick or stone, depending on porosity; 250 to 300 sq. ft. on wood or metal.

Specifications—*(a) For Waterproofing Substructures*—The waterproofing contractor shall apply a waterproof membrane of No. 60, Waterproofing and Bonding, Des Moines Elaterite, manufactured by The Elaterite Paint & Manufacturing Co., Des Moines, Iowa, to the outside of all foundation walls to a point 6 in. above grade, including piers, and to be carried over all footings and properly joined to waterproofing course on outside walls. Membrane to consist of 2 coats properly applied so there shall be no pinholes or uncovered spaces. At least 24 hours must elapse after the application of first coat before applying a heavy second coat, allowing it to dry thoroughly before covering. Walls shall be cleaned thoroughly to remove all loose particles, must be dry and, if of concrete, thoroughly set before applying No. 60, Waterproofing and Bonding, Des Moines Elaterite.

(b) For Dampproofing Interior Walls Which Are to Be Plastered, or for Waterproofing Exterior Walls Which Are to Be Stuccoed—The contractor is to apply 2 coats of No. 60, Waterproofing and Bonding, Des Moines Elaterite, manufactured by The Elaterite Paint & Manufacturing Co., Des Moines, Iowa, over the inside surface of all exterior walls which are to be plastered, and outside surface of all walls which are to be stuccoed. The walls are to be clean and dry and the application to be so made that there shall be no pinholes or uncovered spaces. At least 24 hours must elapse between the application of the first and second coat, which is to be a heavy coat.

Plaster is to be applied directly over the coating of No. 60, Des Moines Elaterite, after the second coat is "set" but while it is still "tacky," though not sooner than 3 hours after the second application, nor longer thereafter than 10 days. Stucco is to be applied directly over the coating of No. 60, Des Moines Elaterite, while it is "tacky," but not sooner than three hours after application of the second coat nor longer thereafter than 10 hours.

The waterproofing and bonding coats may be applied with air gun or spray, if contractor prefers.

(c) For Integral Waterproofing Use—All mortar to be made waterproof must have No. 60, Waterproofing and Bonding, Des Moines Elaterite, as manufactured by The Elaterite Paint & Manufacturing Co., Des Moines, Iowa, incorporated integrally, proportioned either with the water used for tempering or with the quantity of portland cement used in the batch in the following manner:

If proportioned with the water used for tempering it should be 1 to 8—1 part No. 60, Des Moines Elaterite, to 8 parts water.

If proportioned with the portland cement it should be 1 gal. No. 60, Des Moines Elaterite, to each 1⅔ bags of portland cement used.

The No. 60, Des Moines Elaterite, is to be added to the mixture in the foregoing proportions after the water has been put in for tempering, and the mixing is then to be continued until there is complete and thorough distribution throughout the mixture. It must not be added to the water before the latter has been put in for tempering the mixture.

This specification covers mortars for laying up brick or rubble stone; for stucco; plaster for coating the inside of cellar and other walls; for cement floor and roof toppings; for cement slabs to be spread over cinder fill in roof construction; for concrete not subject to heavy water pressure.

For integral mixture in waterproofing concrete which is subject to heavy water pressure, the proportion should be changed to 1 part No. 60, Des Moines Elaterite, to 4 parts water used—1 gal. No. 60 to each 4 gal. of water. The No. 60 to be added after the water has been stirred into the mixture and the stirring continued until there is complete distribution.

No. 65 Stone Backing

Specification—All stone to be coated, before setting, on the five unexposed sides; also entire inner surface, including joints, to be coated after the stone is set with No. 65, Stone Backing, Des Moines Elaterite, as manufactured by The Elaterite Paint & Manufacturing Co. of Des Moines, Iowa.

EUCLID CHEMICAL CO.

Manufacturers of Concrete Floor Hardeners and Waterproofings

CLEVELAND, OHIO

Products

Euco Iron Waterproofing.
Euco Concrete Floor Bond.
Euco Floor Hardener Crystals.
Also Integral Hardeners; Waterproofings; Colors; Anti-Freeze Compounds; Window Caulking Compounds; Floor Enamels.

Engineering Service

Our Engineering Department is at your service. They will be glad to study your problems in connection with cement or masonry construction and recommend the best methods for waterproofing, hardening, bonding or other treatment of cement and masonry.

Euco Iron Waterproofing

Description

Euco Iron Waterproofing is a heavy powder, chemically prepared, one of the principal ingredients of which is finely divided metallic iron. It is applied in a mixture of cement grout to the interior or exterior. While the grout or cement is setting the iron oxidizes, forming a binder which hermetically seals all pores and forms an effective barrier against water.

Advantages

Positively seals the surface of masonry and concrete walls against pressure.

Easily applied by any handy building laborer.

Applicable to either old or new jobs.

Inexpensive, 20 lbs. will cover 100 sq. ft. of surface with 3 coats.

Directions for Use

Clean the walls with a stiff brush to remove all loose particles.

Wet the surface before the waterproofing coat is applied.

Mix dry 2 qts. of Euco Iron Waterproofing with 1 qt. of Portland cement in a 2-gal. bucket and add water until the mixture has the consistency of heavy paint. Keep well stirred so that the iron, which is heavier than cement, does not settle to the bottom.

Apply with a brush, giving three coats, allowing time for each coat to dry.

Continue to apply over moist portions until leaking is completely stopped.

"Bleed" the wall, if flow is very heavy, by chiseling a small hole and inserting pipe. Apply waterproofing around pipe. After waterproofing is hardened remove pipe and plug hole with blue clay or yellow ochre mixed with Euco Iron Waterproofing.

Leaks around doors may be stopped by removing frame and waterproofing surface against which frame rests.

Euco Concrete Floor Bond

Description

Euco Concrete Floor Bond is a finely pulverized metallic substance chemically treated, which, when applied to concrete slabs prior to laying the topping, effectively and permanently bonds the topping to the slab and forms a bond stronger than the concrete itself.

It is a time-tried and time-tested product that has been used with unfailing success. Its trifling cost makes its use profitable on all jobs.

Advantages

Eliminates for all time the risk of toppings coming loose as it bonds the slab and topping together with a lasting mechanical key.

Topping and slab are made into one unit that has the same co-efficient expansion so that it is unaffected by temperature changes.

Inexpensive, 5 lbs. will bond 100 sq. ft. of floor surface at a cost of a fraction of a cent per square foot.

Directions for Use

The floor slab should be thoroughly cleaned with a wire brush or broom. If surface is extremely smooth, roughen slab.

Remove all loose particles, dust, etc.

Where surface is oil soaked, greasy, etc., wash the slab with one part muriatic acid and 5 parts of water.

Twelve hours before applying floor topping, soak the slab with water. When the water is absorbed, apply bond coat as follows:

Mix 1 measure of Portland cement and 2 measures Euco Concrete Floor Bond, into a 5-gal. bucket. This should be mixed thoroughly (dry), then add sufficient water and stir until this mixture becomes the consistency of a heavy paint.

Apply with whitewash brush or broom, thoroughly brushing this slush coat into the surface and immediately follow with the floor topping, laid in the usual manner.

Euco Floor Hardener Crystals

Description

It is a well-known and definite fact that Magnesium Fluosilicate is the hardening agent in practically all liquid surface floor hardeners. Euco Magnesium Fluosilicate Crystals have won a widespread reputation in surface hardening operations on concrete floors based on their convenience, economy and uniformly good results. Instead of buying trade named hardening solutions that carry a large element of advertising expense and a still larger profit let us furnish you with Euco Magnesium Fluosilicate in dry (crystal) form.

After careful investigation, the Associated General Contractors of America conferred its "Seal of Successful Performance" on Euco Crystals based upon recommendations from members who had used them and were unanimously favorable in their reports.

Directions for Use

Euco Crystals of Magnesium Fluosilicate are furnished in barrels of 325 lbs., half barrels of 200 lbs., kegs of 125 lbs., pails of 40 lbs.

Mix them in the proportion of 2½ lbs. to 1 gal. of water. One gallon treats 100 sq. ft. with three coats.

Euco Crystals will keep indefinitely without deterioration.

GENFIRE STEEL COMPANY

(THE GENERAL FIREPROOFING BUILDING PRODUCTS)

Waterproofing and Dampproofing Products and Technical Paints

YOUNGSTOWN, OHIO

For Branch Offices, see page B1694

Products

WATERPROOFINGS, Integral and Membrane; DAMPPROOFINGS, above and below grade; ROOFINGS, built-up membrane and plastic; CEMENT ACCELERATORS and FROST PREVENTIVES; FLOOR HARDENERS and PRESERVATIVES for cement or wood, integral, plain and colored, and after-treatments; STEEL and IRON PAINTS; ACIDPROOFINGS; BONDING COMPOUND; TIMBER PRESERVATIVE; OILPROOFING.

For Windows, see page A1175; for Metal Lath, Steel Joists and other Metal Building Specialties, see pages B1694-1695.

Waterproofings, Integral

GF 10 Waterproofing Paste—An ammonium stearate paste used in the gauging water for densifying and waterproofing all kinds of concrete and cement work.

GF 11 Waterproofing Powder—Especially suitable for cast stone, cement blocks, and other similar work where a minimum of water is used.

GF 12 Cement Accelerator—A colorless liquid to be mixed with the gauging water. It accelerates the set of cement so that in 2 days the work is as hard, throughout, as ordinary work in 30 days. It raises the temperature of the mass and lowers the freezing point of water, so that it becomes a frost preventive, thereby eliminating the necessity of heating water, aggregates or finished work. It densifies the mass and makes cement work waterproof.

GF 14 Ironcote—A finely ground iron powder chemically treated to form a waterproofing for walls and floors subjected to hydrostatic pressure.

Waterproofings, Membrane

GF 17 Bitumen—A high grade pure bitumen to be melted and used hot, with either GF 18 Waterproof Felt or GF 21 Saturated Fabric.

GF 18 Waterproof Felt—A strong, bitumen-saturated felt, made of all rag stock weighing 15 pounds per 100 square feet, single-ply. Each fiber is impregnated with bitumen.

GF 21 Saturated Fabric—A cotton duck fabric, saturated with GF 17 Bitumen. For use in deep foundations or on bridges and floors subject to vibration and stresses.

Dampproofings

GF 16 Brush Coating—A pure bitumen paint, applied cold as a brush coating to the exterior faces of walls below grade, and on concrete underbed below wood floors.

GF 250 Mastic Cement—A heavy plastic coating, applied cold with a trowel for the same uses as GF 16. Can be applied to damp surfaces. Also made in colors for caulking.

GF 251—A special form of GF 250 made in light and dark gray of a heavy consistency to be used by hand for caulking.

GF 100 Transparent Waterproofing—For waterproofing exposed exteriors of brick, stone, stucco or concrete. Prevents staining, discoloring and efflorescence.

GF 101 Brick and Cement Coating—Made in various colors for the same uses, under the same conditions, as GF 100. It is unaffected by the alkalis and lime of cement and will not crack or peel.

GF 102 Cement Paint—A dry cement paint powder to be mixed with cold water. Made in a variety of colors.

GF 200 Dampproof Coating—A bitumen paint to be applied to interior surfaces of exposed walls above grade.

GF 220 Stainproof Backing—A bitumen paint to be applied cold to the built-in parts of all cut stone, to prevent staining and discoloration.

Floor Hardening and Preserving

GF 12 Accelerator—Described under Waterproofings. Also made in colors to make an integrally colored cement floor equal in appearance and durability to tile.

GF 12 Colored Wax—Made in the same colors as GF 12 colored, for application to colored cement floors to give a gloss finish and to rectify patchiness of the surface.

GF 140 Metallic Hardener—Pure iron particles properly graded and specially treated to become temporarily nonabsorbent for troweling on to the surface of cement floors at the time of laying.

GF 141 Oilproofing—A finely ground pure iron powder for mixing with cement and sand.

GF 145 Crystalrox—To be dissolved in water and applied to exposed cut stone, or cement work, to harden the surface and prevent stains.

GF 155 Floor Enamel—A colorless or colored cement floor paint to hide or cover any stains or discolorations of the surface, being unaffected by the alkalis of cement.

GF 160 Wood Floor Preservative—A highly wear resistant transparent oil filler and finish combined, for either hard or soft wood floors, that is unaffected by water, oils, alkalis, etc. Prevents dry rot, shrinkage and splintering. Gives an eggshell gloss finish, that can be varnished, waxed or polished.

Roofings

GF 17, 18, and 21 Membrane—Described under Waterproofings.

GF 250 Plastic and Mastic Cement—Described under Dampproofings.

GF 250 Colored—A trowel coating, for the same purpose as GF 250 Mastic Cement, made in brown, red, gray, buff and green.

GF 253 Brush Coating—A brush coating containing asbestos fiber and of a similar nature to GF 250 Mastic Cement, to be used cold, for recoating and repairing all kinds of built-up membrane roofings.

Coatings for Structural Steel, Iron and Timber

GF 300 Steel Coating—A shop coating for structural steel.

GF 325 Alkali Coating—A bitumen paint to be used on structural steel embedded in masonry or exposed to the weather.

GF 350 Galvanic Primer—A transparent coating that penetrates the greasy film left by the galvanizing process, bonds to the iron and forms a bond for any ordinary linseed oil paint.

GF 550 Timber Preservative—For application to structural timbers to be embedded in earth or masonry, or exposed to the elements. Prevents dry rot and disintegration from heat, cold, dampness, oils, insects and fungi.

GF 160 Wood Preservative—Described under Floor Hardening.

Acidproofings

GF 99 Acidproofing—Renders surface immune to the action of acetic acid, alcohol, alkalis, ammonia, blood, caustic soda 50%, disinfectants, ensilage, garbage, hydrochloric acid 25%, lactic acid, live steam, malic acid, molasses, muriatic acid, oxalic acid, picric acid 25%, septic fluids, sewage, smoke, sodium chloride, sugar, tannic acid, wine.

GF 17 Bitumen—Applied hot to protect against alum, ammonia, hydrofluoric acid, hydrochloric acid, mineral acids and dilutes, nitric acids, picric acid, sulphuric acid.

GF 145 Crystalrox—Protects concrete and cement work against creosote, lactic acid, malic acid, molasses, sugar.

GF 220 Bitumen Paint—Applied cold with brush to protect against acetic acid, mineral acids and dilutes, cyanides.

Bonding Concrete

GF 140 Bonding Compound—A powerful acid powder applied to any concrete or cement surface to afford a monolithic bond for new work. Develops a bonding strength of 80 pounds per square inch.

Service and Handbooks

The Waterproofing Handbook covers all ordinary problems in waterproofing, dampproofing and preservation of different parts of building construction. We also maintain a Waterproofing Service Department at Youngstown, Ohio, whose advice and assistance are supplied without cost or obligation.

THE HYDROLITHIC WATERPROOFING CO., INC.

Engineers and Contractors for Waterproofing

725 Grant Building
PITTSBURGH, PA.

TELEPHONE, ATLANTIC 1890, 1891

EASTERN REPRESENTATIVE: TAYLOR-HYDROLITHIC CO., 95 Liberty Street, New York, N. Y.—Telephone, Bowling Green 3295

Services

We are ENGINEERS and SPECIALISTS for WATERPROOFING, making a specialty of Cement Coat Waterproofing.

Registered HYDROLITHIC TRADE-MARK

We contract for the waterproofing of basements, subways, reservoirs, vaults, tunnels, swimming pools, boiler rooms, elevator pits, etc.; guaranteeing a positive and permanent waterproofing for all kinds of masonry construction.

Our Engineering Department is always at the service of architects, contractors, or others.

Advantages

The advantages of our Hydrolithic System over the old membrane method or integral waterproofing are many, as follows: it is permanent; it is cheaper, no extra supporting walls are required; no additional floor finish is necessary; ease and economy with which repairs can be applied without delaying the other building trades; it can be applied as readily to old buildings as to new; it forms a good wearing surface on the floor and an attractive wall finish; it is not affected by heat and can be used in boiler rooms and other places where the heat would destroy pitch and felt waterproofing.

Thirty Years without a Failure

All work is executed in the well-known Winslow's Hydrolithic System which was invented by E. J. Winslow more than 30 years ago. It is the original plaster coat method and, although its wonderful success has inspired a host of imitators, it is still easily the leader in its field. During the thirty years it has been in use, we have not had a failure.

Application

Hydrolithic is applied as a cement plaster coat to the inside of exterior walls and top of floors. Wall coatings are 5/8 in. and floor coatings 1 in. thick, all surfaces being thoroughly chipped and cleaned before application. Due to the special qualities of Hydrolithic and the expert care with which it is applied, a perfect bond is secured. Hundreds of successful installations are in existence all over the country where Hydrolithic has for many years remained absolutely dry, although subjected, in some cases, to very high hydrostatic pressure.

Specifications

The interior surface of all exterior walls to a height of .... feet above the finished basement floor and the upper surface of the concrete floor slab of the entire basement [sub-basement] as well as all trenches, pits and machinery foundations shown on the plans, shall be waterproofed with Winslow's Hydrolithic Cement Coatings, applied by THE HYDROLITHIC WATERPROOFING CO., INC. All surfaces, before waterproof coating is applied, shall be thoroughly chipped and cleaned. Wall coating shall be 5/8 in. thick, applied in 2 coats, thoroughly floated and troweled to a smooth and even finish, free from imperfection. Floor work shall be 1 in. thick and serve the double purpose of a waterproofing agent and a wearing surface. Floor coating shall be floated and finished as described for wall coating.

Guarantee—THE HYDROLITHIC WATERPROOFING CO., INC., shall furnish a written guarantee covering their work for a period of three years. During this time they shall, at their own expense, promptly repair any leaks which may develop; providing such leaks are not due to structural changes in the building or to external damage to the waterproofing for which they are not responsible.

Products

HYDRATITE INTEGRAL WATERPROOFINGS for concrete; DEHYDRATINE DAMPPROOFING COMPOUNDS; SYMENTREX, Decorative Waterproof Coating for concrete and masonry; KONCREX, Decorative Coating for cement floors; VULCATEX CALKING COMPOUND, for windows and joints; HORN'S DRY COLORS for coloring cement, mortar and stucco; STAYBRITE for coloring, hardening and waterproofing cement floor finish in one operation; HORNSTONE CRYSTALS for dustproofing and hardening cement floors; FERRO-FAX METALLIC FLOOR HARDENER; TRIPLEFLEX COTTON FABRIC for membrane waterproofing; KERAMIK KEMIK PROCESS for producing pottery effects in concrete.

Also Kopper Karbol Wood Preservative; China Flat Wall Paints; Bondsit for Bonding Old and New Concrete; Expansion Joint Cement; Hornrock, a Decorative Waterproof Coating, can be applied on green concrete and wet surfaces.

Service

We have a waterproofing engineering staff that designs materials and methods for unusual situations. Their service is offered gratis to engineers, architects and contractors. *An architect's folder, containing specifications on individual sheets,* offered free on request.

References

Over thirty years of experience. Tests made by governmental departments, engineers, laboratories, etc. We have a long list of jobs where our materials have given satisfactory service in every section of the world.

Hydratite Integral Waterproofing Compound

A compound to be mixed with cement to make permanently watertight concrete mixtures. Made in paste and powder form. Paste is a white, smooth material to be dissolved in gauging water and distributed by it through the concrete or cement mortar. In mass concrete, use 1 part to 33 parts of water; in cement plaster and stucco work, 1 part to 17 parts of water.

Dehydratine Dampproofing Coating

These black compounds are applied to the inside surfaces of exterior brick, stone and terra cotta walls, dampproofing them and providing insulation. Dehydratine No. 1 brush coating for use on brick, stone or terra cotta. Dehydratine No. 10 trowel coating for use on brick walls only. The use of these materials eliminates the necessity of furring and lathing. Gypsum plaster may be applied directly to the dampproof film thus provided.

Dehydratine No. 2 Transparent Exterior Waterproofing Brush Coating

A transparent liquid for dampproofing and reducing the porosity of brick, stone, stucco, masonry or concrete surfaces. It is applied with a brush and has a high penetrating capacity, thereby completely filling the pores and preventing absorption. It is applied on the outside of the building only.

Dehydratine No. 3 Stone and Trim Stainproofing Backing

A specially prepared, quick-drying, black, brush coating to be applied on all unexposed surfaces of cut stone or of wood trim.

Vulcatex Calking Compound

Vulcatex is a permanently elastic material, unaffected by the changes in temperature: Is unexcelled for calking windows, pointing up terra cotta and masonry joints, and for expansion joints in concrete or masonry. It is made in gray, red, and brown.

Hornstone Crystals

A chemical floor hardener composed of mineral salts, dissolved in water. It is flushed over cement floors, producing a harder, more compact and dustless surface, that is proof against absorption of all liquids for all time. It can be used on old or new floors.

Ferro-Fax Metallic Floor Hardener

A ground metallic aggregate and hardener introduced into the top surface of cement floors when laid, and mixed with cement finish coat or topping. Ferro-Fax insures a smooth, hard, dense surface that withstands severe traffic. Furnished in gray, black, red or green.

Symentrex—Decorative Waterproof Coating for Concrete, Stucco and Masonry

Symentrex applied, presents the finest surface texture and meets most effectively the severe requirements for enduring waterproof effect combined with sustained fine appearance.

Symentrex is produced in four attractive colors, permitting a wide choice of color schemes. It is furnished in liquid form and is applied to the dry surface in two coats by means of brush or spray. The coating bonds effectively to the underlying surface, is thoroughly waterproof and provides a uniform, non-fading color effect which is easily kept clean with soap and water.

Staybrite (Integral Coloring, Waterproofing and Hardener for Cement Floor Topping)

This material integrally colors, hardens and waterproofs cement floor topping in one operation. Furnished in following colors: Tile Red, Mexican Red, Japanese Black, French Gray, Persian Yellow, Alaskan Brown, Linoleum Brown, China Blue, Egyptian Green.

Horn's Dry Colors—Coloring for Cement, Lime and Composition Mixtures

These colors are high grade metallic oxides, and have great tinctorial strength. They are unaffected by the actinic rays of light as well as by the various chemical reactions prevalent in cement mortar and masonry.

These colors are economical as but small quantities are required to the bag of cement, and because of the small percentage needed to permanently color cement for floors and mortar, the strength of the cement is maintained.

Quantities Required per Bag of Cement—Tile Red, 8 lb.; Mexican Red, 8 lb.; Japanese Black, 3 lb.; Persian Yellow, 8 lb.; Alaskan Brown, 10 lb.; Linoleum Brown, 10 lb.; China Blue, 8 lb.; Egyptian Green, 8 lb.

The foregoing proportions are for maximum depth of color. Lighter shades are obtained by reducing the quantity of color per bag of cement used.

Dehydratine No. 80 Liquid Integral Cement Accelerator, Antifreeze Compound and Hardener

A liquid compound to lubricate, harden and permanently strengthen cement, mortar and concrete mixtures. Cuts the time and labor by accelerating the set of cement. In freezing weather, it acts as an Antifreeze, makes cement mortar more "fatty" and increases the bond in masonry work. It is mixed in the gauging water.

Koncrex Liquid Protective Coating for Cement Floors

Prolongs the life of cement, producing a hard, dustproof, washable surface, impervious to the destructive action of oils and other liquids.

Continued on next page

Waterproof Basements

The use of Hydratite Integral Waterproofing renders mass concrete and cement plaster thoroughly and permanently waterproof.

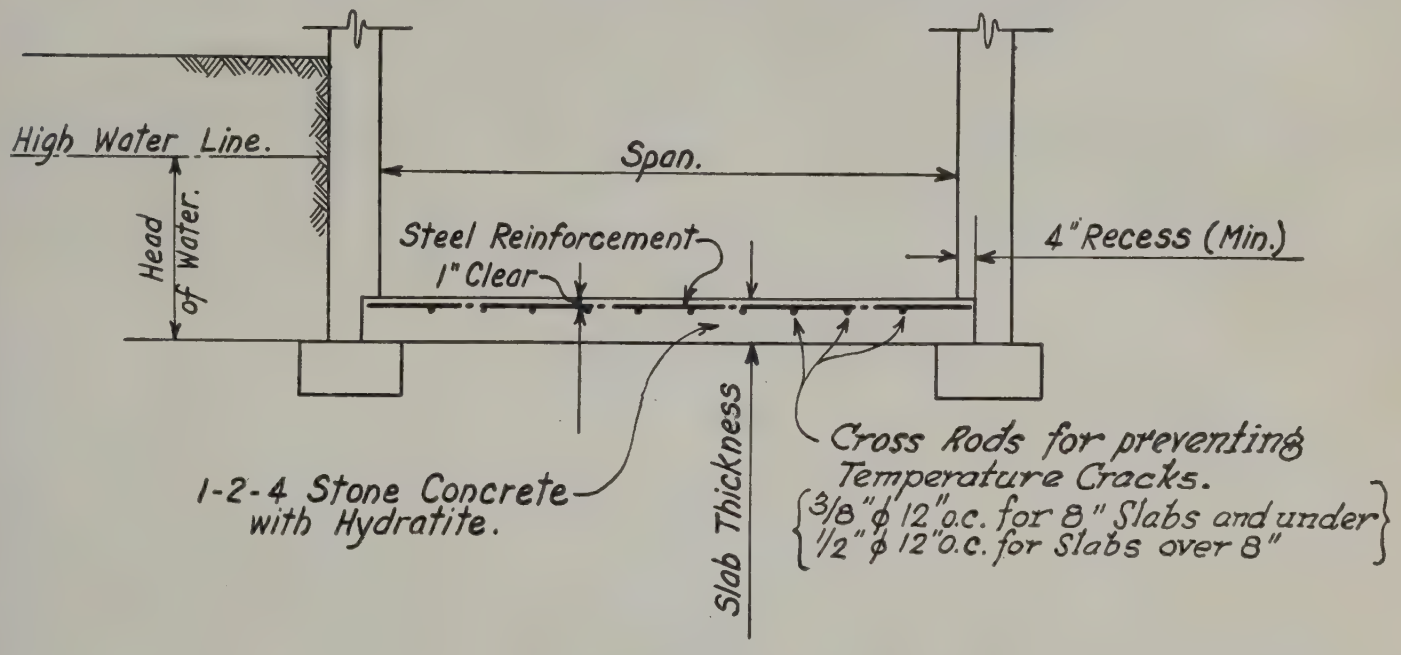
In foundation work, however, in addition to waterproofing, the walls and floors must be properly designed to prevent cracking under the action of hydrostatic pressure.

While basement walls are ordinarily able to withstand such pressure, the floor slabs in contact with earth require special design to prevent lifting or cracking as a result of the upward load thus imposed.

Therefore, for the architect's convenience in designing such slabs, our Engineering Department has prepared the table below.

CONCRETE FLOOR SLABS

Waterproofed by Hydratite Integral or Plaster Coat Methods



All reinforcement to be round deformed rods. For greater head of water or larger spans our Engineering Department should be consulted for special layout.

Use of Table:

Problem—Head of water = 8'-0". Distance between walls = 15'-0". Opposite the 8'-0" Head and the 15'-0" Span column we find an 11" slab reinforced with 5/8" ϕ @ 4" o.c. which should run from wall to wall. This slab should have 1/2" ϕ @ 12" o.c. cross rods.

Detailed Specifications for solution of any Waterproofing Problem furnished upon request.

METALTITE

TRADE-MARKS

Advantages

Years of specialized experience has taught us that the *proper application* is no less important than the use of the highest quality materials. This has led to the maintenance of reliable men with experience pertaining to the application of waterproofing and dampproofing materials.

In using our materials we co-operate with the architect to see that he receives the results that he desires, as well as to see that the material is being applied correctly.

Our liquid materials such as Hydroseals, Kling-Koat Cement Coating and Penetrite Transparent Waterproofing Compound, are applied by spray under 80-lb. pressure. This method insures the Hydroseal, etc., penetrating the surfaces by force, and at the same time gives the surface a coating, making a perfect plaster bond, dampproof coating or waterproofing.

The many prominent buildings on which our materials have been used successfully are permanent testimonials of the quality of our materials and our knowledge of waterproofing.

Policy

After more than ten years' experience in manufacturing waterproofing materials we are convinced that they should be made only of the highest quality.

From the time we started we adopted the policy of making the very best possible materials. Regardless of competition we have maintained the highest standard of our materials. *Due to our quantity production you can obtain the greatest possible value.*

Our customers appreciate that it does not pay to jeopardize the entire result of the work when the proportionate cost of the waterproofing materials is practically a few per cent of the entire contract. *We have never sacrificed the high quality of our products to meet competition.*

When you use materials manufactured by the HYDROSEAL WATERPROOFING COMPANY you are insuring yourself against unsatisfactory results.

Brands, Uses and Specifications

PURPOSES	MATERIAL	SPECIFICATIONS
For Dampproofing and Waterproofing Concrete, Brick and Cement		
To dampproof exposed walls to be plastered—unfurred or furred with hollow brick, furring tile or concrete blocks.	*Hydroseal* No. 330	Coat the interior of all exposed walls 1 coat, and, if necessary, 2
To prevent surface infiltration and dampness in basements and cellars	*Hydroseal* No. 640	Apply 2 heavy continuous coats
For dampproofing the interior of exterior walls above or below grade	*Hydroseal Semi-mastic*	To be applied (stipulate where) by a 4 knot brush, to be a continuous coating from grade to roof line, 1 ft. on ceiling
To prevent and resist severe conditions of dampness and water below sub-level	*Hydroseal* No. 640, in conjunction with burlap, felt or cheesecloth.	Apply No. 640, and burlap, etc., alternately 3 to 5-ply until the hydrostatic pressure is equalized
To render waterproof by physical mixture with concrete and cement	*Penetrite* Integral Waterproofing Paste	For ordinary work add 1 gal. to 32 gal. of water
	Penetrite Integral Waterproofing Powder	Use 2 lb. to a bag of cement; under most severe conditions, 3 lb.
An iron waterproofing applied on the inside face of exterior walls below grade, and on top of structural slabs	*Hydroseal Metaltite*	To be applied and guaranteed by Contract Department of H. W. Co.
Used as an integral waterproofer, an integral hardener, as well as an anti-freeze	*Conwatco Mix*	Conwatco Mix as waterproofer for mass concrete, use 1 gal. to 15 gal. of gauging water
For Stainproofing Limestone and Marble		
For the protection of limestone, marble, etc., against stain caused by the cement through surrounding masonry	*Hydroseal* No. 309	Apply to all unexposed sides of stone, 1 continuous coat
To prevent water penetration through old walls of stucco, cement faced brick or stone by an exterior application	*Penetrite* Transparent Compound	Apply 2 coats, having joints well mortared
For the Protection of Metal		
For prevention against electrolysis and corrosion of exposed structural steel	*Hydroseal* No. 352	Apply 1 shop coat, to be followed by a field coat, different color
For Waterproofing and Beautifying Concrete and Plaster Surfaces		
To beautify and protect exterior walls of brick, stucco cement, and concrete	*Kling-Koat* Cement Coating (flat and gloss)	Applied like paint, 2 coats
To prevent water penetration through old walls of stucco, cement faced brick or stone by an exterior application	*Penetrite* Transparent Compound	Apply 2 coats, having joints well mortared
For Treatment of Floors		
To prevent the dusting and abrasion of concrete floors	*Penetrite* Floor Finish	Apply 1 coat primer and 2 coats finish. Allow 24 hours between applications
For application after cement or concrete floor is laid. Makes the floor hard, dustproof and waterproof	*Penetrite* Liquid Floor Hardener	One application is all that is necessary if the condition is not severe
Mixed with the cement to harden and waterproof	*Penetrite* Metallic Floor Hardener	Approximately 20 lb. to a sq. ft. in the 1-in. top coat
Used as an integral waterproofer, an integral hardener	*Conwatco Mix*	For mass concrete and top coat use 1 gal. of gauging water. For mortar work use 1 qt. to 1 bag of Portland cement
For Caulking		
	Hydroseal Caulking Compound

Asbestos Ebony and Electrical Products.....page C3413

Also Packings for all purposes; Floorings; Refractory Cements and Furnace Linings; Asbestos Wood; Insulating Lumber; Asbestos Products of all kinds.

Waterproofing

Installed only by approved contractors.

The Johns-Manville system of waterproofing is based on the membrane, and not on the integral, method.

The latter method is reliable only in so far as the walls retain their integrity and do not crack—a condition which the incorporation of the waterproofing media into the cement cannot eliminate.

In the membrane method, however, the waterproofing is practically a separate unit, dependent for its waterproof characteristics, not on the integrity of the concrete, but on its own strong, flexible, substantial construction.

The Johns-Manville system of waterproofing uses only high grade materials, the reason why experience has proved it to be most economical and most satisfactory.

In the Johns-Manville system of waterproofing the following materials are used:

Johns-Manville Concrete Primer
Johns-Manville Asbestos Felted Fabrics
Johns-Manville Standard Saturated Cotton Fabrics
Johns-Manville Asphalt Waterproofing Cement

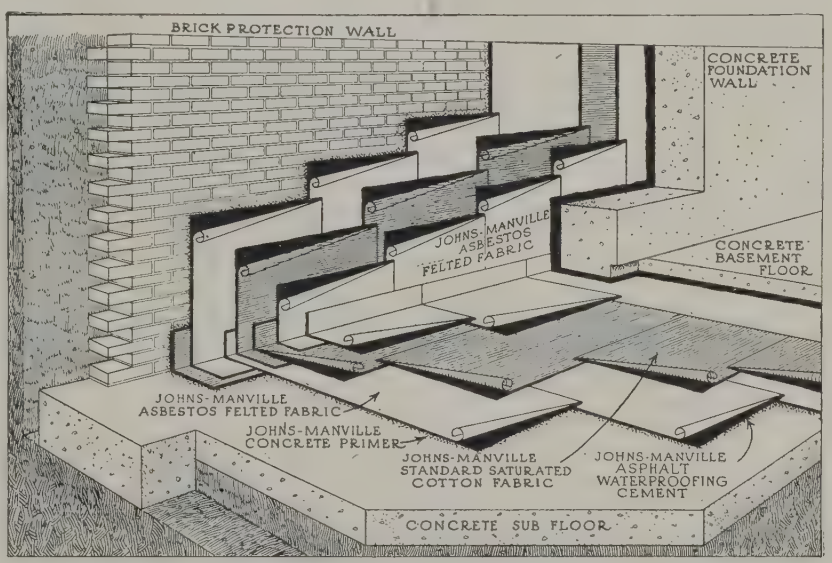
The amount of waterproofing that should be used on any particular building is so intimately related to that building, and is influenced to such an extent by local conditions, that it is not practical to write a specification for waterproofing that will be applicable in all cases.

Dampproofing

Dampproofing, which is the protection against moisture or dampness on the inside surface of walls or floors, is used only when the presence of this moisture is not caused by hydrostatic pressure. Whenever there is any indication of hydrostatic pressure, waterproofing methods must be used. Dampproofing is, therefore, a simpler problem than waterproofing, but in this case also a proper specification can only be written when the local conditions are thoroughly understood. Johns-Manville recommends the following materials for dampproofing:

Johns-Manville Aquadam
Johns-Manville Concrete Primer
Johns-Manville Liquid Waterproof Coating
Johns-Manville Waterproof Cement
Johns-Manville Asbestos Felted Fabric

These materials are used singly or in combination depending on local conditions and amount of dampproofing required to successfully combat the moisture.



Typical Installation of Johns-Manville Waterproofing

Johns-Manville Service

Architects are urged to avail themselves of the free service of the waterproofing engineers maintained at all branch offices of JOHNS-MANVILLE CORPORATION, for consultation on waterproofing and dampproofing problems, and for the preparation of proper specifications.

Karnak Membrane Waterproofing System

The Karnak system is based on the use of a highly refined and very ductile asphalt, reinforced and held in place by a strong elastic interlocking membrane, made of cotton cloth saturated with asphalt. Because Karnak asphalt contains no impurities or foreign matter and because this waterproofing is held in place by a strong elastic binder, less plies are required than in felt systems. In the usual case, 2 plies of Karnak fabric with 3 heavy moppings of Karnak asphalt will give absolutely adequate results.

KARNAK

Uses—This system will be found to be thoroughly dependable for use on building foundations, bridges, viaducts, pump wells, retaining walls and wherever sub-level construction is exposed to water pressure.

Karnak Asphalt—Melting point 150° to 160° F.; penetration at 32° F. not less than 10, at 115° F. not more than 100; ductility at 77° F. not less than 30 cm.; loss in weight and penetration under the standard A.S.T.M. heat test, less than 0.5% and 10% respectively.

Karnak Fabric—An elastic cotton fabric, thoroughly impregnated with Karnak Asphalt, having a minimum tensile strength of 50 lbs. per in. and a minimum stretch of 10% in either direction. The thread count shall be between 18 and 26 threads per inch assuring an open mesh. The raw weight shall be less than 4½ oz. and the saturated weight from two to three times the raw weight.

Architects' Specification—The waterproofing course shall consist of 2 plies of Karnak Fabric and 3 layers of Karnak Asphalt, applied in strict accordance with the manufacturer's directions.

Tests—Every lot of asphalt and fabric is tested at the source by an independent laboratory which places its seals and identification numbers on each package. A copy of this test will be sent directly to the architect by the testing laboratory.

Publications—We have bulletins covering all points: a technical discussion of bituminous waterproofing; lists of architects, engineers and railroads who use Karnak; lists of typical Karnak installations; detailed descriptions of some particularly interesting projects.

Karnak Cut-backs and Plastics—We make a complete line of primers, brush plastics, trowel plastics, joint fillers.

Karnak Special Purpose Asphalts—To meet the needs of manufacturers. State your needs to our Engineering Department.

Karnak Roofing—The same as the waterproofing blanket. Particularly adaptable for roofs protected with tile or concrete because the expansion of the surfacing will not tear the roofing blanket.

Krodeproof

A Preventive of Corrosion and a New Method of Applying Asphalt as a Waterproofing Agent—Krodeproof consists of minute particles of asphalt suspended in water together with a special agent. When applied to any surface, wood, steel or concrete, the water evaporates and there is left a composite structure of asphalt and agent particles which is actually more effective than pure asphalt as a protective coating.

KRODEPROOF

TRADE-MARK

Advantages—Krodeproof, being a dispersion of asphalt and water, is always applied cold. It can be applied with an air spray, brush or trowel; and it may be built up to any thickness. After the Krodeproof has set up it will not flow, bleed or run at any temperature up to 300° F.

Uses—Krodeproof is most effectively used wherever protection is required against moisture, acid or alkali fumes.

Users—Railroads; against locomotive gases, brine drip and on the decks of concrete bridges, and retaining walls.

Marine; against salt water corrosion.

Contractors and engineers; against moisture below grade and for surfacing roofs.

Hydro-electric plants; on penstocks, transmission towers, etc.

Manufacturing plants; for lining coal bunkers, for lining acid chimneys, boiler setting compound, etc.

Coverage—80 sq. ft. per gal. on steel; 40 sq. ft. per gal. on concrete.

Korkseal

Korkseal is an asphalt plaster used for the protection of cork board insulation. It is made from Krodeproof mixed with inert materials; which gives a creamy plastic, very easy to apply, firmly bonding to the corkboard—setting up into a tough rubbery protection coating which will not crack, and will not permit the penetration of moisture into the corkboard—thereby preserving the original usefulness of the insulating material.

KORKSEAL

TRADE-MARK

Engineers and contractors have found Korkseal more efficient, and less expensive. A representative list of installations will be sent on request.

Refrigeration Specifications—To maintain the efficiency of corkboard as an insulator, it must be kept dry; to do this it is necessary to keep all "live" air out of the corkboard. Therefore: (1) Prime the masonry wall with Krodeproof. (2) Erect the corkboard to the primed masonry wall with 180° M.P. Karnak Asphalt. (3) Protect exposed surface with a ⅛-in. coat of Korkseal. All of these materials to be applied strictly in accordance with the instructions of the manufacturer.

Master Builders Concrete Hardening, Waterproofing and Dampproofing Products

Integral Hardeners—MASTER BUILDERS METALLIC CONCRETE HARDNER, a waterproofer and dustproofer in standard gray and seven other colors, for use in either topping type method or Master Builders Monolithic Method on floors subject to heavy usage....page A83

MASTER MIX, colorless hardener, waterproofer and dustproofer of cement floor topping for commercial, light industrial or foot traffic. Functions at all low temperatures down to 15° F.....page A84

COLORMIX, in nine basic permanent colors, for producing wear-resisting, dustproof, waterproof concrete floors in colors .....page A84

STAINPROOF, a jellylike coating applied 36 hours after troweling, which dries to a tough, impenetrable film, to protect surfaces of new floors during construction period. Removed after job is completed and floor cured .....page A84

COLORWAX, for finishing Colormix floors.....page A85

Surface Hardeners—*In Colors*—DYCROME, a hardening, dustproofing and coloring "after treatment" for finished cement floors. Comes in seven colors. Used singly or in duo-tone combinations.....page A85

DYCROME WAX, a special wax for finishing Dycrome processed floors.....page A85

DYCROME STAINLESS OIL, a special oil for finishing Dycrome floors exposed to weather or staining.....page A85

Colorless—SANISEAL, an "after treatment" for plain floors. Makes porous, dusting concrete floors hard, wear-resisting and dustproof .....page A86

EFFLOREX, a liquid chemical for removing efflorescence permanently.....page A86

Surface Waterproofings—*Colorless*—MASTERSEAL, for use over decorative surfaces.....page A86

Colored—MASTERTEX, in 10 colors for tinting and waterproofing concrete, stucco, masonry, brick and non-glazed tile, etc.....page A86

Integral Waterproofing for Mass Concrete and Cement Mortar—

Liquid—Concentrated .....page A87

Powder .....page A87

Paste.....page A87

Cold Weather Waterproofing—MASTER MIX, for waterproofing winter brick mortar or floors...page A87

Pressure Resisting—METALLIC WATERPROOFING .....page A87

Dampproofings—*Surface Applications*—PLASTER BOND, an interior dampproofing.....page A87

FOUNDATION COATING, for the exterior of masonry below grade .....page A87

Descriptions and Advantages of Masterbuilt Floors

In 1910 THE MASTER BUILDERS COMPANY instituted the principle of hardening concrete and produced the first concrete hardener. Since that time THE MASTER BUILDERS COMPANY has been supplying hardeners for concrete floors in practically every type of building—to serve under every sort of industrial or commercial process, to resist the wear of every kind of traffic or use. It is the policy of THE MASTER BUILDERS COMPANY to base their recommendation in each instance on knowledge of what each type of hardener will do under the kinds of traffic to which the floors will be subjected.

Masterbuilt Floors are constructed according to definite, standardized principles, employing Master Builders Integral and Surface Hardeners of five general types.

Type 1—Metallic Hardener—Integral—For new floors, Master Builders Metallic Hardner, a water-absorbent, pure metallic granular aggregate, produces a surface half iron, half cement. Metallic Hardner is floated and troweled into the finish of the cement floor when it is laid and exact specifications, which govern quantities and qualities of materials and method of workmanship, control the installation of the top finish from start to completion. This type hardener is made in standard gray, red, buff, green, blue, brown, battleship gray, and black.

Type 2—Integral Admixture Hardener—For new floors, Master Mix, a semi-liquid chemical, which, added to the gauging water, is introduced into the mortar when it is being mixed, resulting in one operation in increased resistance to abrasion, to acid and alkali action, and produces a non-dusting and a waterproof floor. Although less resistant to wear than the metallic hardened floor, this surface is ideal for office and commercial buildings, loft and light manufacturing purposes. Here again, the hardener, added during installation, is made an integral part of the floor; the strength and density are built in throughout the thickness of the wearing course. Master Mix contains no calcium chloride.

Type 3—Colored Hardener—Integral—An adaptation of Type 2 is Colormix, which produces wear-proof, waterproof and dustproof concrete floors in permanent colors—tile red, linoleum brown, battleship gray, nile green, buff, white, french gray, blue, and black. Colormix contains no calcium chloride.

Continued on next page

Type 4—Surface Hardener (After Treatment)—For floors already installed, Saniseal, a powerful chemical combination, is applied to the set surface of a finished floor. By the ensuing chemical reaction, the surface is made dust-proof and wear-resisting. This type of hardener meets the demand for a hardening remedy for floors that are already in, and for old floors that are dusting and wearing out. Applied to the set concrete, any surface treatment is superficial and effective only on a thin layer of the surface. Although its principal function is dustproofing of surfaces already down, surface hardener is frequently specified for new floors under the *baseless assurance* that it enables them to bear heavy traffic indefinitely. (See "Integral vs. Surface Treatments" below.)

Type 5—Colored Surface Hardener (After Treatment)—A development of Type 4 is Dycrome, a colored liquid hardener which, applied to the surfaces of plain cement floors, both hardens and colors them through chemical reaction. Recommended for floors in apartments, hotels, stores, residences, theaters, clubs, etc.

What Building Owners Say about Hardened Concrete Floors

Since the introduction of hardeners in 1910, thousands of the integrally hardened type of concrete floors have been laid; thousands of plain concrete floors have been treated with surface hardeners. To determine what the comparative performance of the two methods has been over the seventeen-year period, the H. P. Gould Company, industrial investigators, asked the engineers and owners of 2250 leading American industrial concerns what their experience has been with floor hardeners. 412 replied. The questions and answers are summarized below.

Briefly, these answers prove (1) That over 60% of plants use hardened concrete floors, (2) That additional expense for hardening is considered justified, (3) That the majority of integrally hardened concrete floors have a life exceeding ten years, while the effectiveness of surface treatments is only from one to four years.

Summarized Reports

(1) "Have you installed or operated on *hardened concrete floors?*" 257 owners said "Yes." 155 owners said "No."

(2) "If so, has it been your experience that *hardened concrete floors* are, as a general rule, sufficiently more efficient and longer lived to warrant the additional cost of the hardening treatment?" 202 owners said "Yes." 36 said "No."

(3) "Is it your experience or judgment that a floor, into which the hardener is incorporated, *when the floor is laid,* is longer lived than one treated with a surface treatment?" 110 owners said "Yes." 21 owners said "No."

(4) With reference to your experience with *floors hardened with Integral Hardener,* over what period of time have these treatments seemed to be effective?" 45.3% said "10 years or over"; 27.5% said "5 to 9 years"; 27.1% said "1 to 4 years."

(5) "With reference to your experience with floors treated *with Surface Applications,* over what period of time have these treatments seemed to be effective?" 11.7% said "10 years or over"; 30.3% said "5 to 9 years"; 58.0% said "1 to 4 years."

How Hardened Concrete Floors Resist Abrasion

At the recommendation of the Portland Cement Association, the Engineering Experiment Station of Ohio State University was engaged to test the various types of hardened and unhardened concrete surfaces to determine their relative wear under abrasion. The results of these tests are shown graphically here. Complete report of the Gould Survey and of these tests in a book entitled "Plain Talk About Concrete Floors" sent upon request.

Master Builders Metallic Concrete Hardner

This perfectly graded metallic aggregate is especially manufactured for mixture with the sand and cement used in production of concrete floors. As it replaces its own volume of brittle sand, it imparts to the aggregate its own metallic qualities: ductility, toughness, strength, permanence. Master Builders Metallic Concrete Hardner consists of water-absorbent, scientifically graded, rough, jagged particles that lock securely in the mixture. It is absolutely free of impurities and exactly uniform in every respect at all times.

Master Builders Metallic Concrete Hardner gives concrete a ductility, or elasticity which plain concrete does not have. This characteristic gives the Masterbuilt Floor a "give and take" that greatly lengthens its life under even the most severe service.

Compressive Strength Tests—How the introduction of metallic hardener greatly increases the strength of the floor is demonstrated by tests made by the Robert W. Hunt Company's Pittsburgh Testing Laboratories.

SUMMARY OF RESULTS OF COMPRESSIVE STRENGTH TESTS

Age of concrete	Plain concrete*	Metallic hardened concrete*	Percentage of increase
3 days	3274	6927	111%
7 days	3626	8695	139%
28 days	6129	13245	116%
90 days	6583	14302	117%

*Pounds per square inch.

Master Builders Metallic Concrete Hardner is especially recommended for heavy duty floors; boiler rooms, trucking aisles, shipping platforms, loading docks and elevator approaches in all buildings; and for all floors in such structures as warehouses, railroad stations, forge shops, foundries, machine shops and industrial buildings generally.

Specifications for Topping Type Method

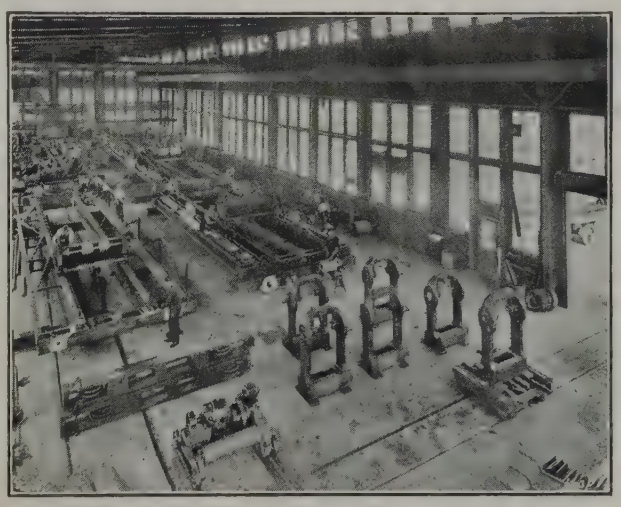
Preparation of Topping—Wherever practicable, topping to be laid before base has set. Topping (not less than full ¾-in. thickness) shall consist of following proportions by *volume*: 1 part tested portland cement to 2 parts coarse, gritty, clean sand.

For heavy duty, specify as follows: 1 part tested portland cement; 1½ parts roofing gravel, trap rock or equal (not exceeding ¼ in. size) free of dust; 1 part clean, coarse, gritty sand.

Mixing—Aggregate and cement shall be thoroughly mixed dry until uniform in color, showing no streaks or patches of the constituents. If mixed by hand the mass shall be turned over dry at least three times. Sufficient water to saturate the mixture shall be added and the mix turned over once again. Special care shall be taken to avoid a sloppy consistency.

Application of Topping—The topping shall be laid and straightedged to a true and even surface, well floated to close all voids and hollows.

Application of Metallic Hardner—After the surface has been floated, but before steel troweling, a dry mixture of 1 part of Master Builders Metallic Concrete Hardner, to 1 part tested portland cement (by weight), mixed to an even color, shall be sprinkled evenly over the surface, using a sieve to get uniform distribution. Not less than 30 lbs. of Master Builders Metallic Concrete Hardner and 30 lbs. of tested portland cement shall be distributed in this manner over each 100 sq. ft. of surface. This shall be floated in thoroughly and troweled; a second steel troweling shall be given the surface when it has set sufficiently to finish hard and smooth. Under no circumstances shall the mixture of hardener and cement be applied when there is any surplus water on the floated surface.



Typical Metallic Hardened Floor Under Heavy Foundry Service at Chesapeake Iron Works, Baltimore, Md.

Expansion Joints—Are recommended at regular intervals in all topping floors. Joints to be cut through the full thickness of the topping with narrow tool and edges to be hard finished.

Safeguarding the Floor—The green floor surface shall not be wet until it is 48 hours old. After the surface has set up 48 hours, the contractor shall cover it with a uniform layer of soft-wood sawdust, shavings or other suitable covering. This covering must not be applied until experiment shows surface hard enough to prevent the covering from scratching or injuring the finish. Surface shall then be kept wet for not less than 5 days. Floors, when prepared as above, will be ready for light traffic in about a week, and for heavy traffic in about 3 weeks under favorable weather conditions.

Exceptions—The use of 30 lbs. of Master Builders Metallic Concrete Hardner to every 100 sq. ft. of surface provides a wearproof finish sufficient to withstand any normal usage.

For floors to bear heavier than normal traffic specify 35 lbs. of Master Builders Metallic Concrete Hardner to every 100 sq. ft.

For floors to bear extra heavy traffic specify 40 lbs. of Hardner per 100 sq. ft.

Specifications for Monolithic Method

The term "monolithic" is interpreted in various ways—and these various interpretations produce various results. Master Builders Monolithic Method is the proven method, by which the floor slab is poured, straightedged, finished and troweled in one operation.

Master Builders Monolithic Method should be definitely specified to secure a Masterbuilt Floor with the following definite results: (a) base and topping are one, with no danger of loose bond, cracking or breaking under service; (b) time, labor and material for extra topping saved; (c) dead weight of topping and necessity for expansion joints eliminated; (d) surface hardened with Master Builders Metallic Hardner resulting in the same great increase in wearing strength as in the topping type method.

Mixing and Placing Slab—The slab shall consist of a mixture of: 1 part tested portland cement, 2 parts coarse, gritty, clean sand, and 4 parts crushed rock (or 1: 2½: 5, when gravel is used). All aggregate to pass 1-in. screen. These materials must be thoroughly mixed; then deposited between screeds to the finished floor level (on heavy slabs, exceeding 6 in. in thickness, ⅛ in. allowance must be made for shrinkage). Thoroughly tamp and screed with straightedge, taking special care to leave no hollows, pits or pockets on the surface.

First Application Metallic Hardner—Shall immediately follow leveling off of concrete slab. A dry mixture containing 1 bag (100 lb.) Master Builders Metallic Concrete Hardner, 2 bags standard portland cement, and 3 bags clean, coarse sand shall be thoroughly (dry) mixed and then distributed evenly (using a sieve) over approximately each 1000 sq. ft. of surface. This preliminary finish will immediately become saturated with the surplus water remaining on the surface; it must then be thoroughly floated into the concrete with heavy wooden floats.

Final Application Metallic Hardner—Immediately following the floating in of the preliminary finish, a dry mixture consisting of 1 bag (100 lb.) Master Builders Metallic Concrete Hardner and 1 bag (100 lb) of standard portland cement, thoroughly mixed to a uniform color, shall be evenly distributed (using a sieve) over each 500 sq. ft. of the floated surface. This final finish must be floated in with wooden floats and immediately steel troweled, with a second steel troweling after surplus water has disappeared. Finished surface must be free from depressions or defects of any kind, presenting a smooth and even texture.

Curing and Protecting Floor—Sawdust or curing sand without grit shall be evenly distributed over the surface to a depth of not less than 2 in., as soon as the concrete has sufficiently hardened. This covering shall be kept moist for not less than 8 days. Contractor to provide sufficient canvas or other covering and heat, before work starts, to protect surface from damage in event of rain, frost, etc.

Master Mix Integral Hardener and Waterproofer

Master Mix CONTROLS CONCRETE
TRADE-MARK

Master Builders Master Mix is a chemical admixture which is added to the gauging water to permanently increase the strength of concrete floors throughout the entire wearing course or topping. Master Mix contains no calcium chloride.

Master Mix improves the workability and increases the density of mortar, introduces a hardening element and a waterproofing element and increases resistance to acid and alkali action. It functions regardless of temperature down to 15°, specially valuable for winter construction of floors, brickwork and masonry.

Master Mix accelerates the final set of cement from 2 to 4 hours; greatly increases the tensile strength in the first 24 hours and from 10 to 20% permanently; increases the ultimate compressive strength from 10 to 13%. Master Mix has been in use for over twelve years to produce Masterbuilt Floors that are wear-resisting, non-absorbent, dustproof and acid-resisting.

Compressive Strength Tests—How the introduction of Master Mix greatly increases the strength of the floor is demonstrated by tests made by the Robert W. Hunt Company's Pittsburgh Testing Laboratories.

SUMMARY OF RESULTS OF COMPRESSIVE STRENGTH TESTS

Age of concrete	*Plain concrete	*Master Mix concrete	Percentage of increase
3 days	2950	4051	37.3
7 days	3670	4066	10
28 days	4261	4806	12.7
90 days	6265	7046	12.6

*Pounds per square inch.

Specifications

1-in. topping shall be installed, proportioned 1 part fresh, tested, portland cement and 2 parts clean, coarse, sharp sand. Mix thoroughly, dry. Add Master Mix to gauging water, gradually, in proportion of 1 qt. Master Mix for every bag of cement used. Pour, float and trowel cement in usual manner. A second troweling shall be given when surface is sufficiently set to produce a hard, smooth finish.

Protect surface from injury with not less than 2 in. soft wood sawdust or curing sand, and keep it wet until surface is hard.

Colormix Colored Integral Hardener

COLORMIX
TRADE-MARK

Colormix is an integral colored hardener for producing wearproof, dustproof, waterproof concrete floors in permanent colors, for use where decorative, hard type floors of tile-like beauty and durability are desired. Dissolved in the gauging water, Colormix dyes every particle of sand and cement in the entire topping a deep, uniform, permanent color.

Whereas ordinary coloring agents seriously weaken concrete, Colormix contains hardening elements which maintain the full tensile and compressive strength.

Colormix is made in the following colors: Tile Red, Linoleum Brown, Nile Green, White, Buff, French Gray, Black, Battleship Gray and Blue.

Uniformity, purity and color permanence characterize Colormix, and the color permanence has been tested and reported satisfactory by the Portland Cement Association. Colormix contains no calcium chloride.

Stainproof—Used to protect the fresh Colormix surface from staining and marring during the construction period and to promote proper curing, insuring clean, unstained floor, free from efflorescence. This invaluable protection for colored concrete floors is an exclusive Colormix advantage.

Specifications

Colormix Top Finish—A top finish of not less than 1½-in. thickness shall be used on a set slab and not less than ¾-in. thickness shall be used on a green slab, topping to be composed of 1 part cement to 2 parts clean sharp sand.

Colormix can be used in the entire thickness of the top finish, but from the standpoint of cost, it is advisable to run the top finish in two layers, using Colormix in the top layer only.

If two layers are run, it is simply necessary to scratch a layer of ordinary 1:2 top finish over the slab, leaving it ¾ in. below finished surface line.

This must be followed immediately by the Colormix top finish.

To Mix Colormix Top Finish—If mixed by machine, first place a small quantity of water in the mixer and then throw in a shovelful or two of sand; then add the right proportion of Colormix as specified below. The above should be agitated by the mixer 10 to 20 revolutions, which dissolves the Colormix. Then add the balance of the batch into the mixer. Allow this total mix to be thoroughly mixed so as to assure a uniform and even color. Care should be taken that mortar is not mixed too sloppy.

If mixed in mortar box by hand, proceed as follows: procure a 1-gal. open top paint pail and a small spring scale. Dissolve the proper amount of Colormix for each batch in the pail first.

Use this solution as the gauging water to hydrate the 1:2 sand and cement mixture in the mortar box. If additional water is required to get proper mortar consistency, add slowly and sparingly, making sure that a perfect and complete mix is secured.

Proportions of Colormix to Be Used—As each color of Colormix weighs differently per unit of volume, one color must not be confused with any other color. Colormix must be proportioned exactly to each bag of cement per the following schedule:

Color	Per bag cement
Tile Red	Use 12 lb.
Linoleum Brown	Use 12 lb.
Battleship Gray	Use 5 lb.
Nile Green	Use 17 lb.
Buff	Use 17 lb.
White	Use 14 lb.
French Gray	Use 10 lb.
Black	Use 10 lb.
Blue	Use 17 lb.

Laying the Top Finish—Apply the Colormix Top Finish to the floor and straightedge, float and trowel in the usual manner. Hard trowel the surface a second time, when it begins to set hard, to a glossy smoothness.

Typical Gray Colormix Floors in John Wanamaker's New York Store Help to Attract Crowds of Shoppers and Withstand the Heavy Traffic

Continued on next page

Expansion Joints—Shall be cut through the full thickness of the topping, at intervals of not exceeding 6 ft.

Protecting the Finished Surface—Master Builders Stainproof, a specially prepared compound for protecting new floors, shall be applied to the surface wherever possible, 36 hours after final troweling is completed, without the previous use of water for curing the concrete surface. A simple test: When the surface is not marked by thumbnail scratching the surface is ready for the stainproof application.

However, where the absorbent nature of the base or fill causes quick drying out of the topping, the surface shall be kept wet with clear water for 3 days. On the fourth day, when surface moisture has disappeared and the thumbnail test has been applied, a heavy paintlike film of Stainproof shall be applied from the container over the entire surface.

This Stainproof film shall be left to dry for 36 hours and shall not be removed until just before the floor is to be turned over for use.

Removing Stainproof Film—After the plastering, painting, labor, and other trades have finished and are out of the building, and just before the floors are to be made available for use, the Stainproof film shall be removed. *First*—cover a limited portion of surface with water (hot preferred) and let stand for 15 minutes. *Second*—remove by brushing or scraping any area of film spotted with plaster or paint droppings. *Third*—with brushes or squeegees remove balance of film on area moistened.

Proceed with a second limited area in same manner. When all debris is removed, the surface shall be mopped thoroughly with clear water, allowed to dry, and then polished, preferably with machine polisher.

Note to Architect: Include next paragraph in specifications where high gloss finish is desired.

Color Waxing the Floor—After the Stainproof film has been removed and the floor is again dry, the surface shall be given an application of Master Builders Colorwax of the same color as the floor.

Dycrome Hardening and Coloring "After Treatment" for Finished Floors

Dycrome is a chemical compound which, applied to concrete surfaces, produces by chemical reaction with the cement a variety of permanent, attractive tints and colors. At the same time, Dycrome hardens and renders the surface wear-resisting and dustproof. Unusual color results are obtained as the degree of chemical reaction between Dycrome and cement varies on different parts of the floor, giving variegated tones that lend interest and distinctive character to the floor.

The colors include Flemish Oak, Weathered Bronze, Cordovan, Palmetto Green, Jade, and Nile Green, and various combinations of these colors in duo-tone effects.

Merits and Advantages—Dycrome can be applied to any unmarred plain cement floor that is clean, free from oils, greases and other foreign substances. This treatment is recommended for surfaces that were left as "plain cement" in the original specification, but which are later found to require a decorative finish. This is of material advantage to those erecting buildings to be occupied by tenants with varying requirements which cannot be incorporated in the original specifications, but must be provided before the tenants move in.

Complete Application Service—The Dycrome treatment may be applied by any capable contractor or workman, or on important jobs is applied by or under the direction of Master Builders Service, Inc., a corps of experts specializing in Dycrome applications.

Specifications

All cement floor toppings to be treated with Dycrome shall be of proportions 1 part standard portland cement and 2 parts clean, sharp sand. Before the cement is added there shall be mixed thoroughly into the sand 2 lb. of hydrated lime for every bag of cement used. Cement shall then be added and mixed dry, then tempered with just sufficient clear water to make a workable mortar. No integral or surface hardeners or waterproofers, other than Dycrome, shall be used.

All surfaces shall be given 2 hard steel trowelings and shall be left uniformly smooth and free from trowel marks. Joints shall be cut throughout the full thickness of the topping, where and as indicated on plans, and shall be kept clean and unmarred by troweling. All special jointing or marking as indicated on plans shall be exactly followed. Under no circumstances shall retempering of surface be done by sprinkling water, nor shall any cement be dusted on surface.

Curing of Cement Surface—All cement floors to be treated with Dycrome shall be cured by spraying once or twice a day with water for 4 days. If this is not possible, floors shall be covered 48 hours after final troweling with 2-in. layer of clean sand which shall be kept thoroughly wet for a period of a week. No building paper, sawdust, earth or shavings shall be used to cover floor.

Floors should be at least 30 days old before Dycrome is applied.

Protection of Cement Floor During Curing Period—Traffic shall be kept off floors for a period of not less than 4 days, and no heavy traffic shall be permitted until the Dycrome Process is fully completed.

Drop cloths shall be used to protect surface from staining by paint, putty, oils, solder paste, marking by wire insulation, or any other damage that may result from other crafts working over the floors.

These floors to be treated with Dycrome shall be turned over to Master Builders Service, Inc., or the Dycrome contractor, free from paint, grease, oil, scratches, mars, stains or other disfigurements which will in any way interfere with the Dycrome Processing or injure the final results.

The general contractor shall arrange to keep these areas free from interruption or trespassing during the application of the Dycrome treatment, and any surfaces that are injured by other crafts either before or after treatment shall be replaced or reconditioned at the expense of the craft responsible for the damage.

Weathered Bronze and Cordovan Dycrome Floor, in the Studio of F. R. Walker of the Firm of Walker & Weeks, Architects, Cleveland, Ohio

Special Finishes — *Dycrome Wax*—Interior areas are finished with Dycrome Wax, a special wax manufactured by The Master Builders Company, to emphasize the color values of Dycrome Floors and give the floors a smooth, soft feel under foot like that of linoleum.

Dycrome Stainless Oil—Exterior areas of floor subject to moisture or staining are finished with Dycrome Stainless Oil, which will not stain nor turn white when wet, an exclusive advantage with Dycrome treatments.

Saniseal, Colorless Hardening and Dustproofing "After Treatment" for Plain Floors

SANISEAL

Saniseal is a corrective for concrete floors which have started to dust, crumble and disintegrate.

It is a liquid chemical preparation which combines with the lime in the cement, forming a new crystal that is exceedingly hard and wear-resisting. It changes the soft, porous surface to a flintlike hardness.

Saniseal is easy to use. No complicated dilutions or applications necessary. Except where a floor is particularly porous, 1 gal. of Saniseal will cover approximately 100 sq. ft.

It does the work overnight in most cases, thus preventing delays.

Specifications on request.

Master Builders Efflorex

Efflorescence on exposed walls of masonry buildings is an unsightly nuisance for which a permanent cure has long been sought. The complete remedy was found through the development by Master Builders Research Laboratories of Efflorex. Where masonry walls are waterproofed following construction with a product such as Masterseal (see below) efflorescence is prevented. Otherwise efflorescence often appears and even a thorough acid wash removes it only temporarily.

Master Builders Efflorex is a liquid chemical compound which, when applied in accordance with the manufacturer's directions, removes all signs of efflorescence and permanently waterproofs the wall against its return.

Master Builders Surface Waterproofings

MASTERSEAL COLORLESS SURFACE WATERPROOFING

TRADE-MARK

Master Builders Masterseal—A specially prepared transparent colorless liquid for waterproofing the exposed surfaces of brick, stucco, stone or concrete walls, where it is necessary or desirable to retain the original appearances. Protects surfaces indefinitely against disintegration, stain, efflorescence, mildewing, checking, cracking, spalling, etc.

Masterseal is a permanent treatment that renders the surface, including the mortar joints, waterproof, by introducing a highly water-repellent element into the surface pores. The penetration is greater than that of the usual treatment. The treatment prevents dirt, grime, soot, etc., from becoming embedded in the pores and, as a result, makes cleaning of the surface easy.

Masterseal is manufactured from a solid hydrocarbon base which is acidproof and alkaliproof, and insures permanency.

Specifications—Master Builders Masterseal shall be applied in 2 coats to all surfaces as indicated, and shall be applied exactly in accordance with the manufacturers' directions.

E. W. Goebel Residence, Kansas City, Mo.
E. W. Tanner, Architect
Waterproofed with Masterseal

MASTERTEX

TRADE-MARK

Master Builders Mastertex—A waterproof cement-base coating that both decorates and waterproofs concrete, brick, stucco, and other masonry surfaces. Colors are White, Brick Red, Blue, Light Green, Cream Ivory, Light Gray, French Gray, Dark Gray, Brown and Pink.

Applied with equal success on exterior or interior surfaces. It can be applied to wet surfaces, such as moist basement walls, fresh stucco, fresh reinforced concrete or surfaces of tanks, vats, pools, etc.

Mastertex takes a set like that of concrete, forming an insoluble, non-porous, crystalline coating which, unlike oil paints, is not affected by extreme weather conditions nor by any of the elements in the concrete. Does not dry out to a chalky, dusty coating; does not wash or rub off. An ideal white coating for common brick houses. Does not check, peel or turn yellow.

By excluding air and moisture from reinforced concrete both Mastertex and Masterseal prevent cracking or spalling due to the corrosion of reinforcing metal and overcome this common form of disintegration which is both difficult and expensive to repair.

Specifications—Master Builders Mastertex shall be applied in 2 coats to all surfaces as indicated, and shall be mixed and applied exactly in accordance with the manufacturers' directions.

Master Builders Integral Waterproofing for Mass Concrete and Cement Mortar

Master Builders Waterproofing Liquid (Concentrated)—Added to the gauging water. Waterproofs by depositing insoluble, water-repellent coating. Increases colloid formation. Requires less water to complete hydration. Produces high initial strength.

Because its use is so simple and easy—the workmen merely adding it to the gauging water, which carries it to every part of the mix—complete, efficient results are insured. No extra labor needed for weighing out, dissolving or mixing; hence, nothing can be neglected to the detriment of the job.

Specifications—Master Builders Waterproofing Liquid, Concentrated, shall be added to the gauging water in the proportions of ⅔ qt. of Waterproofing Liquid to each bag of cement in the mixture to be gauged. This requires 1 gal. per cu. yd. for 1:2:4 concrete.

Concrete shall be poured as dry as consistent with good practice, shall be placed in one continuous operation, and shall be thoroughly spaded to procure uniform density.

Special care shall be taken to clean and roughen the surfaces of previous pourings that have been set before placing additional concrete.

Master Builders Waterproofing Powder—An insoluble, water-repellent powder which coats cement particles, preventing seepage. Permanent insolubility insures permanent watertightness. Prevents the early evaporation of moisture, thereby increasing the colloid formation.

Specifications—Master Builders Waterproofing Powder shall be mixed dry with the portland cement in the proportions of 8 lb. of Waterproofing Powder to each barrel of cement (400 lb.) used. This mixture shall be thoroughly stirred so that a complete and uniform mixture is assured.

This mixture of Waterproofing Powder and cement shall then be added to the other aggregates. The whole volume shall then be thoroughly mixed until a uniform color and mixture is obtained, before adding the tempering water.

Master Builders Waterproofing Paste—A white, concentrated paste which is dissolved readily in the gauging water and is carried to every part of the mass. Produces a stable, water-insoluble, water-repellent crystal, which coats cement particles, nullifying the capillary action.

In complicated formwork it is sometimes considered necessary to use an excessive amount of water to obtain proper flowability of the mixture; with Master Builders Waterproofing Paste less gauging water is required to give complete hydration and proper flowability. Increases colloid development, colloid swells to fill the voids thus giving double protection against percolation of water.

Specifications for Waterproofing Mass Concrete—To 6 lb. or three qts. of Master Builders Waterproofing Paste add 1 gal. of water, and stir to a smooth mixture.

Use this mixture, together with sufficient clear water (about 33 gal. additional) to hydrate 1 barrel (400 lb.) of cement and its corresponding sand and stone, which shall be in the proportions of 1 part cement, 2 parts sand, 4 parts stone.

Special care shall be taken to clean and roughen the surface of previous pourings that have become set before placing additional concrete.

Specifications for Waterproofing Cement Mortar—To 6 lb. or 3 qt. of Waterproofing Paste add 1 gal. of water and stir to a smooth mixture.

Use this mixture, together with sufficient clear water (about 16 gal. additional) to hydrate 1 barrel of cement (400 lb.) and its corresponding sand, which shall be in the proportions of 1 part cement, and 2 parts sand.

Master Mix—A chemical admixture, a combination concrete hardener and waterproofer, which is added to the gauging water. Refer to page A84 for description and functions of this product.

Master Mix
CONTROLS CONCRETE

Specially recommended for winter construction of brickwork and masonry, as it improves the workability and increases the density of cement mortar, hardening and waterproofing the joint, doing so uniformly regardless of temperature down to 15° F.

Specifications for Waterproofing Brick Masonry—Mortar in which bricks are laid shall be 1 part cement and 2 parts sand. Mortar shall be tempered with water to which has been added 1 gal. Master Mix to each 10 gal. of water. Carefully grout each course of brick, taking care that all joints are filled with mortar.

Specifications for Waterproofing Mass Concrete—Master Builders Master Mix shall be added to the gauging water for mass concrete in the proportions of 1½ gal. of Master Mix per cubic yard of concrete.

Master Builders Metallic Waterproofing

Metallic Waterproofing—A perfectly graded uniform metallic powder used on outside or inside face of concrete or other masonry surfaces to make them impervious to water, even under pressure. Its application varies with the conditions to be remedied.

Specifications and Data—On request.

Master Builders Dampproofings

Master Builders Plaster Bond—For application to the inside of exterior walls. Prevents dampness from passing through exterior walls into the atmosphere of the rooms, insulates and prevents staining and discoloration. Forms a perfect bond between surface and plaster coat.

Foundation Coating—For coating exterior walls below grade. Semipliable, yielding to expansion and contraction without breaking, checking or peeling.

Specifications for the Use of Plaster Bond and Foundation Coating—Master Builders Plaster Bond [Foundation Coating] shall be applied to all surfaces indicated, strictly in accordance with the manufacturers' directions.

Supplementary Literature and Samples

All products described in greater detail, in either concise data manuals suited for the architect, or more descriptive catalogues for the layman, all 8½x11 in., indexed and tabbed for A. I. A. filing.

These booklets, as well as specimen blocks of concrete treated by each Master Builders Method and mounted on file-size boards, are sent without charge upon request.

Consultation and Service

The pages which follow present, in condensed form, complete data on Minwax products. A more detailed discussion is furnished in separate bulletins, which will be gladly furnished on request. Our engineers will present complete recommendations on design and specifications and furnish estimates either on the entire problem or on some specific detail or question. Consult with local representative where possible, or write direct giving details as completely as practicable.

Through 24 years of study and experience in this field, our purpose has been to develop for each problem the material best suited for that particular group of conditions. The record of accomplishment made by each product establishes its outstanding efficiency and permanence, and, in many cases, has created new standards of service.

To list or recount the accomplishments of these years in the limits of this catalogue is impracticable, but complete detailed data and a list of nearby installations will be gladly furnished on request.

To assist the architect in immediately locating information on the kind of work he is interested in, we are furnishing a paragraph index below. Necessarily this index cannot perfectly cover all the possibilities of the several materials, but the heading and descriptions will suggest further uses.

Guide and Index for Minwax Materials

Kind of Work	Paragraph No.
Below Ground Level	
Dampproofing Foundations and Retaining Walls	7, 8
Dampproofing on Damp or Green Concrete	21–23
Dustproof Finish for Basement Floors	41, 42
Joints between Footings and Walls	14–16, 18, 19
Waterproofing (Membrane) Against Pressure	1, 2, 6
Outside Walls Above Ground	
Efflorescence or Salts, Prevention of	24–26, 28
Joints between Brick and Concrete Spandrels and Pilasters or Beams	18–20
Painting and Waterproofing Exposed Walls of Concrete, Brick or Stucco	34, 35, 36–39
Pointing (Waterproof) for Joints in Brick or Cracks in Stucco	27, 39
Pointing (Elastic) for Terra Cotta and Stone Joints, Copings, Cornices, etc	11, 14, 17

Minwax Membrane Waterproofing System

(1) For Bridges, Pools, Reservoirs, Tanks, Subways, Floors, Roofs, Foundations, Sidewalks, etc.—The Minwax Membrane System is the original cotton fabric or elastic system. It consists of hot moppings of Minwax Waterproofing Asphalt reinforced with Minwax Fabric which has previously been saturated with the same asphalt.

The asphalt possesses four requisite qualities to an unusual degree: Permanence, elasticity at all temperatures, toughness at all temperatures, and smooth flowing and high filming qualities.

Minwax Fabrics are woven from a long-fiber cotton and embody to the highest possible degree all the necessary properties: permanence, strength and elasticity at all temperatures, ease in handling and placing without wrinkles. They become an integral part of the mopping courses.

Note: The Minwax Company, Inc. manufactures two standard Fabrics: Specification Fabric 80-lb. strength, Cotton Cord Cloth 50-lb. strength. Higher strength will give greater protection and is generally recommended. Bulletin No. 31 gives complete data.

Uses—The Minwax Membrane System is recommended by the Joint Committee on Concrete and Reinforced Concrete for *all locations* where thorough waterproofness is required. Being elastic and stretchable, it is the logical system for slab, pool, floor or deck conditions exposed to variations in temperature or vibration where danger of cracking or checking definitely exists.

Tests—Pittsburgh Testing Laboratories show an elasticity of over 10% for the completed waterproofing.

Tests by Columbia University show that the completed waterproofing will stretch, without rupture, ¼ in. at 0° F. under field conditions.

Tests by the Pittsburgh Testing Laboratories show that the completed 2-ply unsupported membrane is waterproof up to a bursting pressure of 374 lb. per sq. in.

Approvals—Since introduced by this company in 1906, the Minwax Membrane System has established the standard of waterproofing efficiency. The results obtained with the Minwax System definitely established the superiority and greater final economy of the cotton fabric system over all others in the face of slightly higher first cost, and largely formed the measure for the standards established by the American Society for Testing Materials, American Specification Institute, Federal Specifications Board and the United States Bureau of Standards.

Minwax materials meet and exceed all requirements of these specifications and deliver many valuable properties which could not be included in a general open specification.

Number of Plies—Two plies of fabric and three moppings of asphalt for average conditions; use a third ply on heads of over 15 ft. or under difficult working conditions.

Covering Capacity—Use 12½ yd. of fabric per ply and 4 to 5 gal. of asphalt per mopping for each 100 sq. ft. of surface.

(2) How Shipped—Fabric, 50-yd. rolls 36 in. wide; asphalt, 50-gal. sheet metal drums.

Specification—The waterproofing shall consist of not less than 2 plies of Minwax Specification Fabric [Cotton Cord Cloth] and 3 moppings of Minwax Waterproofing Asphalt applied by experienced mechanics in accordance with the manufacturer's directions.

All surfaces shall be smooth, firm and temporarily dry. Completed work shall be protected from puncture.

(3) *Slabs, Sidewalks, Floors, Promenades, etc.*—Membrane waterproofing shall be continuous, extending over and into expansion joints and connected to wall waterproofing, or flashed 3 in. above finished grade.

(4) *Pools, Tanks, etc.*—Reinforce all corners and angles with 18-in. strip. Build first ply on walls, lapping 6 in. out on floor. Build two-ply on floor, lapping 6 in. up on wall. Build second ply on walls. Provide 9-in. flange on all pipes for flashing. Waterproofing shall turn over top of wall and across floor where necessary. Use third ply on pools in upper stories.

Note: Do not place tile directly on waterproofing membrane. There should be a minimum of 3 in. of concrete or 4 in. of brick between tile and waterproofing.

(5) *Showers*—Two-ply membrane waterproofing shall be installed continuous over entire surface of the shower stall floor, and shall extend up on sidewalls or curbing at least 6 in. In no case shall this distance be less than 3 in. above finished shower stall floor level. Waterproofing on walls shall be 1-ply carried to height shown.

Note: Tile can be applied over membrane in stalls only. In rooms handle as for swimming pools.

(6) *Foundations*—From grade, membrane waterproofing shall be carried down outside of walls, through at footings, across basement floor, under and around all pits and trenches, and under or up all columns, forming a complete, watertight envelope. Protect all waterproofing with 1-in. coat of cement mortar.

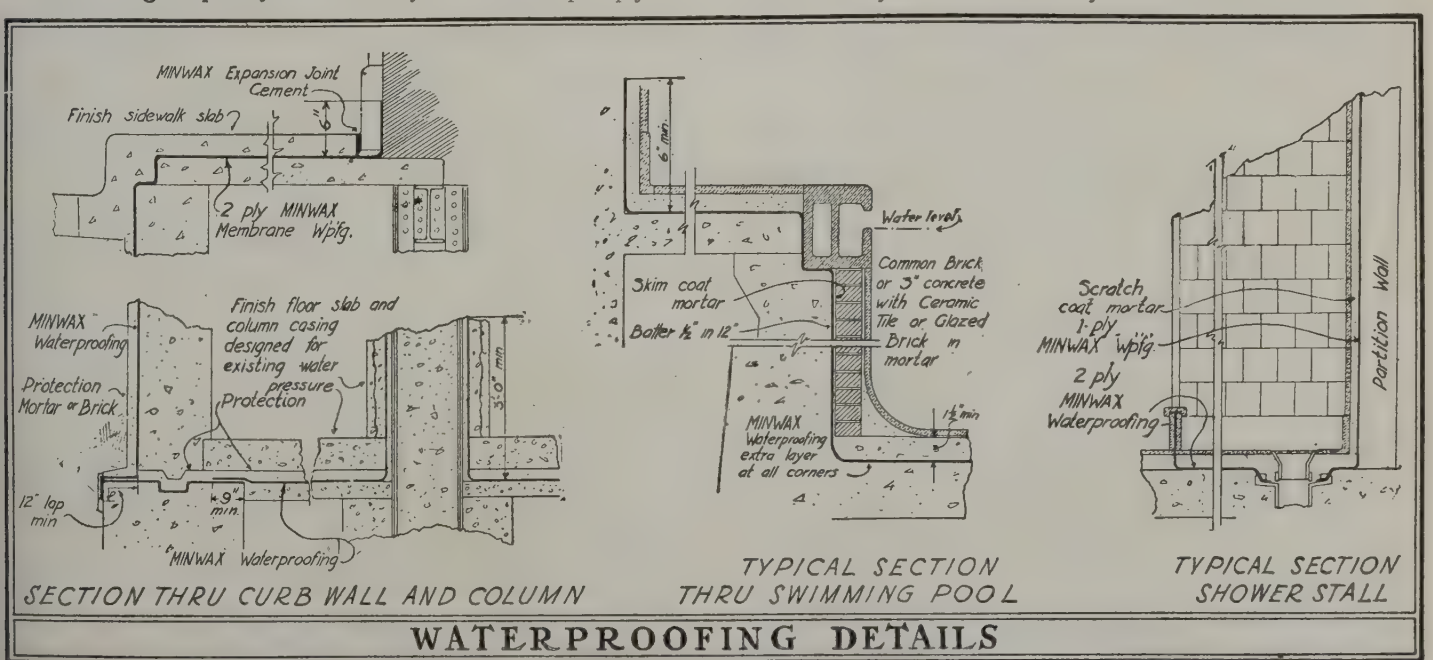
Where impossible to work outside of wall, build brick course against sheathing, apply waterproofing and cast wall against same.

Where waterproofing must be applied inside structural walls, cover same immediately with concrete designed to hold existing pressure.

Provide pumping to remove all pressure and seepage, and keep surface dry during waterproofing and until concrete has set.

Minwax Fibrous Brush Coat (Semi-mastic)

(7) For Dampproofing the Backs of Abutments, Retaining Walls, Foundations, Underneath Plaster, etc.—This material is applied cold (as delivered) with a long handled roofer's brush. It eliminates heating equipment cost, wastage, etc. It is a combination of Minwax Asphalts and special graded asbestos fiber. The asphalts penetrate the surface and a soft, sticky, fibrous skin is formed which closely approximates a full membrane system in efficiency.



SECTION THRU CURB WALL AND COLUMN — TYPICAL SECTION THRU SWIMMING POOL — TYPICAL SECTION SHOWER STALL

WATERPROOFING DETAILS

Continued on next page

This coating can not be chipped or flaked off, and backfilling handled in a normally careful manner will in no way cut or damage it.

Covering Capacity—Approx. 100 sq. ft. per gal. per coat.

(8) How Shipped—In 5, 30 and 55-gal. containers.

Specification—Walls shall be coated from grade to footing with 2 thorough applications of Minwax Fibrous Brush Coat, allowing 12 hours to elapse between coats. Materials shall be applied cold, without adulteration, with a long handled roofer's brush and well brushed into all surfaces, leaving no voids. Backfill in not less than 12 hours, exercising care to prevent damage of surface. Material shall be thoroughly stirred before and during application.

Note: It is important to provide subsoil drainage to carry off water and prevent development of hydrostatic pressures.

Special Asphalt Fillers for Sidewalk Lights, Grooves, Expansion Joints, etc.; Putties and Caulking Compounds

(9) Minwax Vault Light Cement—An asphaltic cement for sidewalk or vault light joints and other horizontal grooves and joints as in promenade decks, etc. It develops a strong watertight bond to concrete, stone or metal and its reliability has made it a standard in the trade. It will not "stew" under sun action or become brittle in cold weather. Use only in joints and grooves that are nearly level. Prime the joints with Minwax Asphalt Primer, heat the Minwax Vault Light Cement and pour it into the joints.

(10) Minwax Fibrous Expansion Joint Cement—For expansion joints in waterproofing membrane or joints where there is considerable movement. Prime the joints with Minwax Asphalt Primer, heat the Fibrous Expansion Joint Cement and pour it into the joints.

How Shipped—Both Minwax Vault Light and Fibrous Expansion Joint Cement are shipped in 1, 5 and 25-gal. containers (231 cu. in. per gal.).

(11) Minwax Caulking Rope—A moulded, fibrous, asphaltic rope for vertical joints, grommets, etc. Prime surfaces before using. Made in $\frac{3}{16}$, $\frac{5}{16}$ and $\frac{7}{16}$-in. sizes. Shipped as desired.

(12) Minwax Asphalt Primer—Thin liquid primer to assure perfect bond. Allow at least 1 hour after application.

(13) Minwax Asphalt Caulking Compound—A black fibrous asphaltic putty compounded of Minwax Asphalts and asbestos fiber for caulking around windows. Will not harden or become brittle. Applied cold as received, this material is of proper consistency for use in hand caulking gun or with trowel.

Covering Capacity—1 gal. fills 45 to 70 ft. of ½-in. joint.

(14) Minwax Caulking Compounds Nos. 1 and 2 (Gray)—A special elastic non-staining composition that never becomes hard and adheres strongly to all materials. Made in standard gray, special colors extra. When filling joints in stone or wood, first coat the sides of joint with Minwax Caulking Primer, a special non-staining priming liquid. Used also for glazing in steel or wood sash. Made in consistencies: No. 1 for hand gun, No. 2 for trowel.

How Shipped—5, 25, 50, 100, 500 and 800-lb. containers.

(15) Specifications—*Wood Windows, Doors, etc.***—Pack space to within ¾ in. of face with oakum and fill solidly with Minwax Asphalt Caulking Compound forced in with hand caulking gun. Replace staff bead, or finish to smooth triangular bead.

(16) *Steel Windows***—For new work butter inside edge of masonry opening or surfaces of sash to be embedded, with thin coat of Minwax Asphalt Caulking Compound. Caulk finished job or old work around head, jamb and sill carefully with Minwax Asphalt Caulking Compound, finishing to neat bead.

**Note:* Use Minwax Caulking Compound (Grey) where color or non-staining is essential.

(17) *Pointing Stone, Terra Cotta, etc.*—Rake out all joints for elastic pointing ¾ in. deep. Paint sides thoroughly with Minwax Caulking Primer. and fill with Minwax Caulking Compound, color to match or as selected. Horizontal joints in copings, cornices, sills, etc., especially important.

(18) Minwax Fibrous Mastic—A stiffer grade asphaltic putty for application with trowel. Especially valuable for damp courses and for making tight joint between concrete and brick or for shrinkage joints in concrete. Bonds firmly to fresh concrete or mortar.

Covering Capacity—1 gal. spreads over 10 to 14 sq. ft., ⅛ in. thick.

How Shipped—Minwax Fibrous Mastic shipped in 1, 5, 30 and 55-gal. containers.

(19) Specifications—*Waterproof Cut-off for Damp Courses, Window Sills and Heads, Parapets, Footings, Joints, etc.*—Prime surface with Minwax Asphalt Primer and trowel on good heavy coat of Minwax Fibrous Mastic. Set masonry, sill or coping. For severe exposures use fabric reinforcing as recommended in paragraph 20. Caulk coping joints with Minwax Asphalt Caulking Compound or Caulking Compound (Gray).

(20) *Spandrel Waterproofing*—Apply 2 good trowel coats of Minwax Fibrous Mastic reinforced with 1 layer of Minwax Cotton Cord Cloth, extending from within 1 in. of face of wall at base of beam, up face and across top of beam, under back-up tile, turning up 4 in. or connecting with inside dampproofing.

Minwax Bituloid (Emulsified Asphalt) Plain for Brush Application, Fibrous for Trowel Application, Fibrated Flooring for Mixing with Sand, etc.

(21) Minwax Bituloid consists essentially of fine asphalt particles suspended in water and has the same protective value as a hot mopped-on coating of acidproof asphalt without the difficulty and expense of the latter. Minwax Bituloid adheres perfectly to damp surfaces. Applied cold with brush or spray, it reaches cracks and corners apt to be overlooked in mopping. Made plain and fibrous for brush or trowel application.

(22)—In addition to its use as dampproofing, Bituloid can be mixed with sand and cement for flooring or floor patching and is especially valuable for cork protection in refrigeration work.

Covering Capacity—Average 80 sq. ft. per gal. per coat.

How Shipped—In 1, 5, 30 and 50-gal. containers.

(23) Specifications—All surfaces to be coated shall be free from oil and loose scale. No coating work shall be carried on at a temperature below 40° F.

Apply 2 generous coats of Minwax Bituloid, flowing it on with a soft, long bristle brush, or use a spray. Allow first coat to become touchdry before applying second coat. Shall be applied in consistency as received, first stirring it thoroughly.

Minwax Transparent Waterproofings for Waterproofing, Frostproofing, Stainproofing and Preserving Concrete, Brick, Stucco and Stone

(24) There are three types of Minwax Transparent Waterproofings: Minwax Clear Waterproofing for concrete, stucco, stone and brick surfaces; Minwax Heavy Clear Waterproofing for especially porous brick, stucco or concrete and for surfaces subject to immersion; Minwax Colorless Waterproofing for limestone, artificial stone, cream faced brick and other light colored surfaces. These three types are necessary to most efficiently meet the wide variety of conditions and materials for which a penetrative surface waterproofing is required.

Advantages—All Minwax Transparent Waterproofings are liquids applied as received with a brush or spray. Ease of application assures positive effective results regardless of the character of the surface. When applied they penetrate into and below the surface for a considerable depth, sealing all pores and making the material waterproof. There is, therefore, nothing to be worn off, broken through or to scale loose; the waterproofing is really inside the surface. Minwax Transparent Waterproofings are applied as the final application, protecting the finished job, sealing craze checks and porous spots. They are independent, positive insurance against moisture penetration. Their waterproofing value is highly permanent, the result of the mineral wax base, and is proven by 24 years' service and test.

How Shipped—All Minwax Transparent Waterproofings are shipped in 1 and 5-gal. cans, 30 and 55-gal. drums.

(25) Minwax Clear Waterproofing—For concrete, stucco, stone and brick surfaces. A light amber-colored liquid which, when applied, penetrates deeply into the surface and cures, depositing a tough mineral

Continued on next page

gum which, in two applications, will completely fill and seal the surface. Its action is purely physical or mechanical rather than chemical and is absolutely positive and independent of the nature of the surface to be waterproofed. It does not form any film or deposit on the surface or change the texture in any way. It changes the color slightly, which change decreases in time.

Covering Capacity—Saturate surface. Generally requires 1 gal. for each 200 to 250 sq. ft. per coat on concrete and stucco; 150 to 200 sq. ft. per coat on brick.

(26) ***Specification***—*General*—Surfaces shall be thoroughly dry, clean, sound and carefully pointed. No work shall be done at wall temperatures below 50° F. Brush dirt and dust off surface and apply 2 thorough coats with a brush or air spray, saturating and working the material into every part of the surface at each coat. Waterproofers shall do further incidental pointing, rubbing Minwax Pointing Paste into small cracks or holes immediately after application of first coat. Allow 24 hours between coats.

(27) *Wall Waterproofing*—All exposed surfaces must be waterproofed from roof flashing over and including coping and down outside surface to grade. Test all brick joints and repoint as necessary, repairing or replacing loose stucco or concrete. Test and carefully recaulk all window and door frames. (See Minwax Caulking Compounds.) Apply 2 coats as above specified.

(28) *Preventing Efflorescence*—Wall must be allowed to become absolutely thoroughly dry, work should only be undertaken under most favorable conditions. Clean off efflorescence with wire brush or dilute muriatic acid solution. When surface is thoroughly dry proceed as above for wall waterproofing.

(29) Minwax Heavy Clear Waterproofing—For especially porous brick, stucco or concrete and for surfaces subject to immersion. This material is heavier grade having a larger percentage of mineral wax and is applied and functions in the same way as Minwax Clear Waterproofing.

Covering Capacity—*See Minwax Clear Waterproofing.*

Specifications—*See Minwax Clear Waterproofing.*

Special Note: No work shall be done at temperatures below 60° F.

(30) Minwax Colorless Waterproofing—For limestone, artificial stone, cream colored face brick and light colored surfaces. This material, developed from Minwax Clear Waterproofing, deposits a superrefined mineral wax supplemented by certain preservative water-repellent chemicals and causes absolutely no change in color even on the lightest surfaces.

On artificial and natural stone, Minwax Colorless Waterproofing performs three important functions: (1) Applied at the mill it protects the surface of semicured stone from absorption of dirt and stain while in transit and prior to setting. (2) In the completed job it waterproofs the exposed surface so as to prevent the accumulation of grime and stain and assists in keeping the building in a light, clean condition. (3) It prevents water and frost action and serves as a protective preservative treatment against disintegration and weather.

Covering Capacity—Saturate surface. Generally requires 1 gal. for each 150 to 300 sq. ft. per coat.

(31) ***Specifications***—*General*—Same as for Minwax Clear Waterproofing except that this material can be satisfactorily applied at temperatures down to 35° F.

(32) *Cut Stone* (new)—All stone shall be absolutely clean and dry before application of the waterproofing. After erection and cleaning and when dry, all exposed surfaces shall receive the second thorough saturating coat of Minwax Colorless Waterproofing. Special attention shall be paid to horizontal and projecting surfaces, as at cornices, copings, etc.

(33) *Existing Stone Work*—Surfaces shall be cleaned down by washing with soap and water or sandblasting and shall receive 2 thorough saturating coats of Minwax Colorless Waterproofing applied with a brush or spray, 12 hours between coats.

Minwax Brick and Cement Coating for Waterproofing and Decorating Exposed Surfaces of Cast Concrete, Brick or Stucco

(34) This Minwax product is a pigment coating produced in a series of attractive flat color tones. It is a combination of the highest grade inert mineral pigments obtainable in a carrying vehicle based on Minwax Clear Waterproofing (one of the oldest, best known and most efficient mediums for exposed wall waterproofing).

This vehicle not only binds the coating on the wall surface so that it stays put, but it penetrates and eliminates the porosity factor and thus prevents the possibility of a dusty, loose coating.

It is not saponifiable and will not burn or peel from alkali action. The coating penetrates and becomes part of the concrete or brick, and the Minwax Clear Waterproofing vehicle penetrates well below the surface and permanently waterproofs it.

The effect produced is flat, without a painty sheen. It changes the texture of concrete or stucco but slightly and maintains the tone of the structural material and gives it the fresh, clean, uniform color selected. On masonry and brick, it gives a whitewash effect.

Applied with a brush or spray. Handles with unusual ease. Covers rapidly and effectively.

Uses—Because Minwax Brick and Cement Coating is primarily a waterproofing, it is a very efficient means of decorating and beautifying concrete, brick or stucco and of preserving them from the disintegrating effects of water and frost

Recommended also as a coating for light courts where a durable, fadeproof, white surface is desired.

Colors—Finished in 11 standard colors: white, cream, yellow, cement gray, limestone gray, caen stone, green, brownstone, terra cotta, water blue and brick red. Special colors extra.

Covering Capacity—Varies between 160 and 250 sq. ft. per gal. per coat, depending upon the roughness and porosity of the surfaces to be treated.

How Shipped—In 1, 5, 30 and 55-gal. containers.

(35) Specifications—***General***—All exposed surfaces as directed shall receive 2 thorough coats of Minwax Brick and Cement Coating, color as selected. These surfaces shall be thoroughly dry, clean and sound, and shall be subject to the approval of painter before work proceeds. They shall be brushed to remove dust immediately before application of first coat. No work shall be carried on at temperatures below 45° F. The first coat shall be thinned with Minwax Brick and Cement Thinner according to the porosity of the surface. (Average conditions require from 10% to 20%.) Painters shall do incidental pointing of open cracks or joints rubbing them full of Minwax Pointing Paste immediately after first coat is applied, brushing surplus from edges of crack and retouching to uniform appearance. When dry retouch light spots in surface with first coat mixture. After 48 hours apply second coat using material as received.

Note: It is especially important that parapets and horizontal surfaces should be done with greatest care. For dampproofing work all exposed surfaces from roof flashing to ground must be coated as per paragraph 27.

(36) ***Newly Laid Brick Walls or New Cast Concrete Surfaces***—Shall receive 1 saturating coat of Neutralizer (see paragraph 38) to be followed when thoroughly dry by the first coat of Minwax Brick and Cement Coating.

(37) ***Old Work***—A sound solid surface must be obtained to get satisfactory service from coating. Wire brush surface thoroughly and repair and repoint all loose mortar or concrete. Use Minwax Pointing Paste for filling small cracks and holes.

(38) Minwax Neutralizer—This is a solution of 2 lbs. of zinc sulphate in 1 gal. of water which preages the concrete surface, assuring maximum coverage and effectiveness from Minwax Brick and Cement Coating. For all new work.

Covering Capacity—150 sq. ft. per gal. One saturating coat required.

How Shipped—1, 5, 30 and 50-gal. containers.

(39) Minwax Pointing Paste—A special putty for filling small cracks and holes in stucco, concrete or brick work. Rub in crack after first coat and remove surplus from edges with stiff brush. Can be mixed with wet Portland cement to stiffen for larger cracks.

Colors—The same as Minwax Brick and Cement Coating.

How Shipped—½, 1 and 5-gal. cans.

Minwax Plasterbond Dampproofing

(40) Applied in 2 good brush or spray coats to inside of wall beneath the plaster finish. It cures tacky and remains pliable and elastic indefinitely. It forms a tough, rubberlike, absolutely impervious, waterproof and dampproof skin that bonds securely to wall and plaster. It eliminates furring and prevents staining.

Covering Capacity—80 to 125 sq. ft. per gal. per coat.

How Shipped—In 5, 30 and 55-gal. containers.

Note: Not recommended for concrete ceilings or conditions where the weight of the plaster may be largely suspended on the coating.

Continued on next page

Minwax Treatments for Concrete, Terrazzo, Tile and Composition Floors

(41) **Minwax Concrete and Terrazzo Floor Finish**—Fills the pores in the surface and subsurface of concrete floors with a tough mineral gum. Applied cold as a liquid after the floor has dried and cured, its action is mechanical and positive, creating an absolutely dense smooth surface. It thus eliminates the cause of dusting and disintegration and prevents the penetration of water, stains or liquids of any sort. The mineral gum is highly resistant to and gives maximum protection against the action of *brine, creamery and packing plant acids, or oils and dilute acids* found in industrial plants, and makes the floors highly *sanitary*.

On terrazzo and marble tile it brings out color, creates an easily cleaned sanitary surface and prevents dusting and staining. On composition and magnesite it prevents stains, disintegration by water and kills salts.

Covering Capacity—Concrete and composition, 200 to 400 sq. ft. per gal. per coat; terrazzo, marble and tile, 400 to 600 sq. ft. per gal. per coat.

How Shipped—In 1, 5, 30 and 55 gal. containers.

(42) ***Specifications***—*Concrete, Magnesite, etc.*—Floors shall be clean and dry. For concrete and composition floors, apply 2 saturating coats with "T" head cotton floor mop leaving no puddles or excess material, allowing 12 hours to elapse between coats. Second coat to cure 24 hours before using.

(43) *Terrazzo, Tile, etc.*—Mop up surface with water to remove all dust and as soon as surface appears uniformly dry apply first coat of Minwax Concrete Terrazzo Floor Finish. Cross-mop first coat to even out and take up surplus. After 24 hours apply second coat in same manner. Dense tile or terrazzo should be wiped up with dry rags 2 hours after each coat.

(44) **Minwax Colored Concrete Floor Finish**—Penetrating and permanent stain colors are added to Minwax Concrete and Terrazzo Floor Finish at the factory and the Minwax Colored Concrete Floor Finish delivered on the work ready for use. These stains bite well into the surface, giving a soft textured color that will resist even concentrated wear. It is especially valuable for integrally colored concrete and magnesite floors that show uneven appearance.

Covering Capacity and Shipping Packages—Same as Concrete and Terrazzo Floor Finish.

Colors—Tile red, linoleum brown and cement gray.

(45) ***Specifications***—Floors shall be clean, dry and absolutely free from dust and stain. Apply 1 thorough coat of Minwax Colored Concrete Floor Finish with a mop, cross-mopping the surface half hour after application to spread material uniformly. After 24 hours apply second coat in exactly the same manner, and about 2 hours after applying the second coat, wipe up the surface thoroughly with dry rags. Polish in not less than 48 hours with Minwax Finishing Wax in color to match.

(46) **Minwax Concrete Floor Binder**—This material is a heavier special grade developed from Minwax Concrete and Terrazzo Floor Finish and is designed for binding together the surface and subsurface particles of a granular, soft or sanding concrete floor.

It is not recommended for average sound concrete floors. On such surfaces Minwax Concrete Terrazzo Floor Finish should be specified and used.

Packages—Same as for Minwax Concrete Floor Finish.

(47) ***Specifications***—2 thorough coats applied with long handled brush. First coat thinned 10% with turpentine.

Minwax Concrete Floor Paint

(48) A high quality long-lived durable floor enamel. Two coats recommended.

Standard Colors—Buff, light gray, dark gray and red.

Covering Capacity—500 sq. ft. per gal. per coat.

Minwax Finishes for Wood Floors and Trim

(49) **Minwax Flat Finish**—For finishing, preserving and staining wood floors and trim. A combination of certain carefully blended oils and mineral waxes in the natural and carrying a series of clear stain colors. Applied in saturating coats, it penetrates rapidly, filling the wood with a tough mineral gum. In its natural or clear color (without stain) it does not darken the wood, but by waterproofing and stainproofing, insures the permanence of the clean, fresh surface.

Effects—In general, the effects produced are of the natural wood stained to the color selected and with a soft waxy sheen. A paste filler can be used where a closed, uniform surface is desired and where the wood is open grained.

Economical in First Cost and Maintenance—Minwax Flat Finish offers important savings, not only in first cost, but in cost of maintenance. It accomplishes results in 2 easily applied coats, reducing the cost per square foot of finished woodwork to the minimum.

It is non-fading and sunfast, highly water-repellant and water-resistant, and will give unusual service on exterior trim exposed to the weather. Under all conditions maintenance is startlingly simple—a cloth dampened with Minwax Flat Finish and used to wipe down the surface will brighten and renew the finish without showing patches or laps, and, periodically used, will maintain permanently and enhance and enrich the beauty of the finish.

Colors—Minwax Flat Finish is made in the following stain colors: No. 9 (natural); No. 11 (light oak); No. 12 (dark oak); No. 13 (walnut); No. 716 (dark walnut); No. 750 (Jacobean); No. 15 (mission green); No. 16 (mahogany).

How Shipped—1, 5, 30 and 55-gal. containers.

(50) ***Specifications***—*Trim*—Wood shall be clean, dry and carefully sanded and shall be stained and finished with 2 coats of Minwax Flat Finish applied with a brush and in color as selected. Each coat shall be wiped with rags in 2 to 6 hours to remove surplus. Allow 12 hours between coats. Do not apply at temperatures below 55° F.

(51) *Floors*—Wood shall be clean and dry and shall be carefully scraped or sanded with the grain (all old finish, varnish, shellac or wax shall be removed). Apply 2 coats Minwax Flat Finish, color as selected, as directed for trim. Protect and, on completion of building, clean floors and polish with weighted brush or electric polisher. For high polish apply Minwax Finishing Wax before polishing.

(52) *Maple Floors (Partial Penetration)*—Apply 2 thorough saturating coats of Minwax Flat Finish No. 9 in accordance with above directions, using special care to remove all surplus after each coat. Close off the floors and protect them against traffic for at least 3 days to permit perfect curing of the materials. Then cover the floor with paper or clean sawdust until ready for final occupancy.

Note: The stain colors are not recommended for maple floors.

(53) **Minwax Penetrating Finish**—Will penetrate the full thickness of 1-in. flooring, sealing and filling the surface and protecting the whole body of the wood, will retard dry rot, warping, swelling, etc. Curing to a tough gum, it binds the surface fibers with tough wear-resisting material.

(54) ***Specification***—*(Complete Penetration)*—Apply 1 thorough even coat of Minwax Penetrating Finish with a brush using 1 gal. for each 350 sq. ft., working it well into the wood. Wipe up the surface thoroughly with clean cloths in not less than 12 nor more than 24 hours after application to remove any excess material. Close off the floor from traffic for from 1 week to 10 days. If necessary, floors can be washed with soap and cold water after thoroughly cured.

(55) **Minwax Acid Stains**—True fuming water stains that develop and burn the color on and into the surface of the wood. Produced in three tones: No. 120, light fume; No. 122, Flemish; No. 123, dark Flemish.

Shipped—In ½, 1 and 5-gal. glass containers.

Covering Capacity—Approximately 300 sq. ft. per gal.

(56) ***Specification***—Apply Minwax Acid Stain with a brush or sponge as conditions require. Sand lightly when dry and apply Minwax Flat Finish, color to be selected. Add colored fillers to No. 9 Flat Finish and wipe off ½ to 1 hour after applying.

Minwax Finishing Wax

(57) A special hard drying paste wax for application over Minwax Finishes for wood and concrete floors where a high wax luster is desired. As already noted, open grained wood can be filled before waxing. Made in natural, tile red and linoleum brown. Apply with a cloth and polish with a weighted brush.

Packed in 1, 3½, 7 and 35-lb. containers.

THE METALCRETE MANUFACTURING CO.

Manufacturers of Concrete Floor Hardeners, Waterproofers and Building Specialties

CLEVELAND, OHIO

Products

REG. Metalcrete TRADE-MARK

METALCRETE (Metallic Concrete Hardener).

LIQUID METALCRETE (Surface Hardener for old or new concrete floors).

LIQUID METALCRETE CRYSTALS (easily converted into Liquid Metalcrete by dissolving).

INTEGRAL LIQUID METALCRETE (a Concrete Hardener, Waterproofer and Accelerator).

INTEGRAL LIQUID METALCRETE CRYSTALS (easily converted into Integral Liquid Metalcrete by dissolving).

METALCRETE METALLIC WATERPROOFER (for waterproofing against pressure).

COLORCRETE (a colored Concrete Floor Hardener).

Also Graphilatum (Roofing products); Long Life Paints (for all purposes); Kleinvar Varnish (excellent for floors and all interior and exterior work).

Metalcrete

Metalcrete is a concrete hardener, scientifically made, chemically pure and absolutely free from foreign matter which injures the setting of cement.

Metalcrete not only hardens, but waterproofs concrete floors. Made of specially treated metallic particles which, when coming in contact with water, expand and seal the pores in the concrete, producing a dense, hard, wearproof and non-absorbing surface.

How to Use Metalcrete—

For Floors in Schools, Office Buildings, Theaters, Garages, etc.—Thoroughly mix one-half each of Metalcrete and good tested portland cement by weight (dry), until uniform in color and showing no streaks. Set aside until ready for use.

Lay floor base and topping as usual, topping to be at least ¾ in. thick and made of 1 part good tested portland cement and 2 parts clean, sharp, coarse sand. Topping to be not too wet.

After topping is laid and evened, *powder* or *dust* the floor with the Metalcrete-cement mixture using 30 lb. of mixture (15 lb. Metalcrete and 15 lb. cement) to each 100 sq. ft. Use a sieve for sifting or distributing over the surface. Allow to stand five minutes, then float mixture with wooden trowel. Then trowel hard. When fairly set, showing no surplus water on surface, trowel a second time to a smooth hard finish.

After 24 to 48 hours, cover floor with a layer of wet pine sawdust or shavings, sand or cinders and rewet twice daily for four or five days. Do not apply the sawdust, etc., until thoroughly set as same may adhere to and ruin the finish.

Note: If the topping and base are not laid at the same time, we recommend a bond coat. Do not use floor for seven days, or while it is curing.

For Factory Floors, etc., Subjected to Extreme Wear and Heavy Trucking—Same as above but using 25 lb. each of Metalcrete and portland cement mixture for every 100 sq. ft.

For Laying a Metalcrete System Monolithic Floor Saving the Cost and Weight of Finished Topping—This is recommended for factories subjected to extreme heavy trucking. The concrete slab should be one, two and four mix, using coarse gravel in preference to crushed granite. Same should be thoroughly mixed, and laid or poured very wet. Dust surface with a mixture of 1 part cement and 2 parts clean, coarse sand, sufficient to absorb surplus water, the quantity depending upon the amount of water. This is to be floated.

Mix 100 lb. Metalcrete, 2 sacks of cement and 1 sack of clean, coarse sand. After floor has been floated sprinkle this dry mixture over a surface of about 300 sq. ft. (use about 30 lb. of Metalcrete, 60 lb. of cement and 30 lb. of sand to each 100 sq. ft.). When distributed and thoroughly saturated (absorbing remaining water) it should be well floated, then troweled. A second hard troweling should be given when fairly dry.

Allow it to *set hard,* then cover with wet sawdust or shavings, and keep wet for three or four days. Floor should not be used for at least a week and no trucking allowed for two weeks.

For Retopping and Repairing Old Floors—Thoroughly mix one-half each of Metalcrete and portland cement by weight (dry), until uniform in color and showing no streaks.

Chip floor with pickaxe, making surface rough. Remove all loose particles, dust, etc. If oil soaked, greasy, etc., it should be washed with one part muriatic acid to five parts water. Allow this to remain until the effervescence or bubbling stops, then rinse floor thoroughly. Turn a hose of floor and let water soak in for 3 hours.

When water is absorbed, apply a slush or bond coat of Metalcrete with a good stiff brush. Slush or bond coat should consist of equal parts of Metalcrete and portland cement, thoroughly mixed (dry), add water (stirring) until it has the consistency of cream. Requires 5 lb. each of Metalcrete and cement to 100 sq. ft. for bond coat.

While still wet, lay topping and after laid and evened, follow first or second instruction above as required.

Liquid Metalcrete

Liquid Metalcrete is a surface hardener which if used on new or old concrete floors produces a dustproof, wearproof, and waterproof surface.

How to Use Liquid Metalcrete—

Sweep the floor as clean as possible; if oily or greasy, wash with 1 part muriatic acid and 5 parts water. When action of muriatic acid solution has ceased, rinse floor with water.

Then flush a liberal coat of Liquid Metalcrete solution, consisting of 1 part Liquid Metalcrete and 2 of water—simply empty a bucketful on the floor and distribute it evenly with a white-wash brush (long handled).

Repeat 24 hours later using 1 part Liquid Metalcrete and 1 part water.

The final coat should be applied 24 hours after second coat, using 2 parts Liquid Metalcrete and 1 part water. Last coat should be very liberal, applying as much as floor will absorb.

This may be done after business hours and the floor used during the day after each treatment. Covering capacity depends upon the porosity of the concrete but will average 75 sq. ft. to the gallon for the three applications. May be applied by any laborer.

Liquid Metalcrete Crystals—

To convert Liquid Metalcrete Crystals into Liquid Metalcrete simply place 2½ lb. of the crystals in a 1-gal. container and fill the container with water. When the crystals are thoroughly dissolved you have 1 gal. of Liquid Metalcrete.

When dissolving Liquid Metalcrete Crystals do not use a metal container.

Metalcrete Metallic Waterproofing—

Metalcrete Metallic Waterproofing is finely ground iron, chemically treated, and when used according to specifications will fill the voids, hermetically sealing the surface regardless of pressure. Will permanently waterproof concrete, brick or stone above or below grade against pressure; easily applied and inexpensive.

How to Use Metalcrete Metallic Waterproofing—

Preparation—Roughen the surface to be treated. Brush well, removing all loose particles. Then soak surface well.

Mixing—Mix 1 qt. of Metalcrete Metallic Waterproofing with 1 qt. of portland cement (dry), until uniform in color. Put into a bucket and add water to reduce to consistency of heavy paint or cream.

Application—Stir this well as used. Apply with a stiff brush directly to the surface, brushing hard to force into the voids. When set in twenty-four hours), apply a second coat (never heavy), and if necessary a third coat. When last coat is set, spray the surface treated with water. Spray two or three times five hours apart.

Unusual Pressure—For heavy water pressure, bore several small holes in wall and insert small pipes to drain. Treat as above and when wall is dry, remove pipes. Apply a coat of liquid mixture to the inside of the holes and plug with a putty of one-half waterproofing, one-half cement, and enough water to make it plastic.

Quantity Required—To determine amount required, estimate 10 lb. Metallic Waterproofing to each 100 sq. ft.

Floor, Walks, etc.—Clean slab and apply as above while still wet, lay topping of 1 in. or more, using 5 lb. of waterproofing to each bag of cement in the aggregate.

Integral Liquid Metalcrete

Integral Liquid Metalcrete is a concrete hardener, waterproofer, and accelerator. It speeds the setting of the cement and will give you a seven-day maturity in forty-eight hours. Integral Liquid Metalcrete is indispensable for retopping and patching old floors.

How to Use Integral Liquid Metalcrete—

For mass concrete mix 1 gal. of Integral Liquid Metalcrete with each 10 gal. of water used for gauging or tempering purposes. This means about 1 gal. of Integral Liquid Metalcrete for each bag of cement.

Integral Liquid Metalcrete Crystals—

To convert Integral Liquid Metalcrete Crystals into solution simply place 4 lb. of crystals in a 1-gal. container and fill the container with water. When the crystals are thoroughly dissolved you have 1 gal. of Integral Liquid Metalcrete.

Colorcrete

Colorcrete consists of two products, Dry Colorcrete and Liquid Colorcrete. The Colorcrete method introduces a modern economical method of laying a beautiful floor which has the durability of concrete and the colors and combinations of any floor design with the same ease of laying as an ordinary concrete floor. Tile effects, medallions, and ribbon borders are all possible if Colorcrete is used. Colorcrete is especially recommended for banks, office buildings, sales rooms, hospitals, restaurants, dormitories, hotels, theaters, porches, garages, etc.

How to Use Colorcrete—

Preparing Slab—Have base or slab finished rough or roughen it with picks. Thoroughly clean and soak it with water 24 hours before topping is to be laid. Make a thin mixture of cement and apply to base, rubbing in thoroughly with a stiff brush, and pour the topping immediately.

A ¾ or 1-in. Colorcrete topping is applied directly to slab. If a ½-in. Colorcrete topping only is wanted, then pour a ½-in. ordinary cement first and Colorcrete topping on this while still wet.

Quantities Required—To mix Colorcrete use the following quantities of *dry* color to each sack of cement, depending upon shade wanted: 8 lb. of Red, 10 lb. of Nile Green, 3 lb. of Battle Ship Grey, 3 lb. of Black, 8 lb. of Linoleum Brown, or four times these quantities to the barrel of cement, making 100 sq. ft. of 1-in. topping of one and two mix, or 200 sq. ft. of ½-in. For white Colorcrete simply use white cement together with white sand.

Specific Directions—Thoroughly mix the *dry* color with the cement *dry* until uniform in color and showing no streaks. Then add 192 lb. of clean sharp sand (free from loam) to each bag of cement, or 768 lb. to each barrel of cement used. Mix the Colorcrete-cement and sand until uniform in color and showing no streaks.

Then mix Colorcrete with tempering water, using 1 gal. of Liquid Colorcrete to each barrel of cement (which should be about 1 gal. of Liquid Colorcrete and 10 gal. of water). Mix as ordinary concrete, not a sloppy mix, but fairly dry, using only sufficient water to allow proper troweling.

Then lay cement and tamp well, screed off and float or cork float until voids are well filled. If deeper color is wanted, dust floor with Dry Colorcrete-cement mixture (without sand). Then float again good with wood float; then shove the joints in (no other time). Rub well with steel trowel and then give final finish by one good troweling with steel trowel.

MITCHELL-RAND DAMPPROOFING CORP.

Manufacturers of M-R Protective Coatings

15 Vesey Street
NEW YORK, N. Y.

Products

DAMPPROOFING (Interior):
- M-R FURRING COMPOUND.
- M-R SEMI-MASTIC.
- M-R DAMPPROOFING MASTIC.
- M-R STONE BACKING COMPOUND.
- M-R RUBBERSEAL SPANDREL CLOTH.

INTEGRAL WATERPROOFING:
- M-R DOUBLE STRENGTH WATERPROOFING PASTE.
- M-R LIQUID WATERPROOFING.

EXTERIOR WATERPROOFING (above Grade):
- M-R COLORLESS WATERPROOFING.
- M-R BRICK and CEMENT COATING in colors.

M-R SUPERIOR CEMENT COLORS.
M-R SHIELD BRAND CONCRETE FLOOR WAX.

Also M-R Anti Freezing Liquid and Cement Accelerator, M-R Caulking Cement, M-R Roofing Cement, M-R Fibre Roof Coating, M-R Black Asphalt Paint, M-R Expansion Joint Asphalt and Gilsonite, Waxes and Asphalts.

Experience

In 1902 we started the manufacture of dampproofing compounds under formulae developed by L. F. Rand, Chemist, and many of the largest buildings throughout the country, representing all classes of structural work, are references to the quality and durability of these products. Twenty-five years of research and experiment have produced a line of waterproofing and dampproofing compounds that makes the trademark "M-R" synonymous with first quality.

Our contracting department, in charge of experienced men, will estimate on furnishing and applying M-R Furring Compound, M-R Semi-Mastic, M-R Dampproofing Mastic, M-R Colorless Waterproofing and M-R Cement and Stucco Coating; also on pointing up brickwork, waterproofing exterior brick, stone or stucco buildings, and the calking of window and door frames. Only expert mechanics are employed in each special line.

We manufacture the compounds. We do the work.

Experience proves that a most satisfactory way to dampproof is by the use of an asphalt-gilsonite mixture, *applied in sufficient quantity.*

M-R Furring Compound

This is a black, elastic, waterproof material, and specified extensively by prominent architects and builders. It is applied by means of a brush to the interior of outside walls above the grade level prior to the application of plaster. This compound prevents the penetration of dampness, and renders the inside of walls verminproof and stainproof.

M-R Furring Compound is recommended for use, also, on terra cotta ceilings and furring to prevent plaster from staining; it bonds perfectly with plaster.

The material can be employed with equal effectiveness for rough concrete surfaces, but should not be used on smooth concrete to which portland cement mortar or plaster is to be directly applied.

The approximate covering capacity of M-R Furring Compound is 60 sq. ft. per gal., 1 coat. It is shipped in barrels, half-barrels and 5-gal. containers.

Typical Specifications—***Preparation of Surfaces***—Point up all voids and breaks in masonry surfaces specified to be dampproof. Patch defective brickwork at ceiling due to centering. Treat similarly the angle of wall and ceiling with cement or lime mortar to form a continuous surface.

Application—The interior surfaces of exterior exposed walls to be plastered are to receive 2 coats of M-R Furring Compound, and in accordance with directions of the manufacturer, the Mitchell-Rand Mfg. Co., M-R Furring Compound shall be applied between floor level and ceiling below. Where the arches are placed prior to this application, the coating shall be carried back 12 in. from the outer walls on the underside of the connecting ceiling.

Cut-outs, wall chases, etc., shall be coated thoroughly before pipes or other work is installed.

M-R Semi-Mastic

Recommended for use on hollow back-up tile walls, where there are deep corrugations in the tile.

Made of high grade asphaltic gums interlaced with asbestos fiber. Has a soft consistency which enables it to be easily applied with heavy roof brushes.

An application gives a coating many times heavier than ordinary dampproof paint.

In one day a man can apply, approximately, one 50-gal. barrel. Packed in 50-gal. barrels, half-barrels and 5-gal. pails.

Specifications—The work included consists of dampproofing all exterior walls above grade.

All surfaces shall be dry and free from dirt and foreign matter. All vertical and horizontal mortar joints are to be pointed up by the mason contractor to the satisfaction of the dampproofing contractor.

The M-R Semi-Mastic is to be applied with a brush in 2 coats, and shall be returned on the reveals of openings, carried around the column castings and concrete beams adjoining such surfaces, in and around all chases, recesses and cut-outs and extend 12 in. on the adjoining concrete slabs.

The material shall be M-R Semi-Mastic. One gallon is to cover not more than 30 sq. ft. and the dampproofing contractor is to state in his estimate the number of 50-gal. barrels of dampproofing material he agrees to use on this job. This is to be checked by general contractor and verified by architect.

M-R Dampproofing Mastic

A black, plastic, waterproof compound, containing only the best ingredients and blended under a scientific process. It is applied with a trowel, similar to cement or any other plastic substance, and is ready for immediate service as received in original packages; no heating or thinning necessary.

Used extensively on the interior of outside walls instead of dampproof paint. It bonds perfectly with plaster, absolutely prevents the penetration of dampness, and makes the inside of walls verminproof and stainproof. Furring and lathing are unnecessary when this material is used.

The approximate covering capacity is 20 sq. ft. per gal. on brickwork. It weighs about 10 lb. per gal., and is shipped in barrels, half-barrels and 5-gal. containers.

Typical Specifications—***Preparation of Surface***—Point up all voids and breaks in masonry surfaces specified to be dampproof. Patch defective brickwork at ceiling due to centering. Treat similarly the angle of wall and ceiling with cement or lime mortar to form a continuous surface.

Application—The interior surfaces of exterior exposed walls to be plastered are to receive 1 troweled coat of M-R Dampproofing Mastic, and in accordance with directions of the manufacturer, the Mitchell-Rand Mfg. Co., M-R Waterproof Plastic shall be applied between floor level and ceiling below. Where the arches are placed prior to this application, the coating shall be carried back 12 in. from the outer walls on the underside of the connecting ceiling.

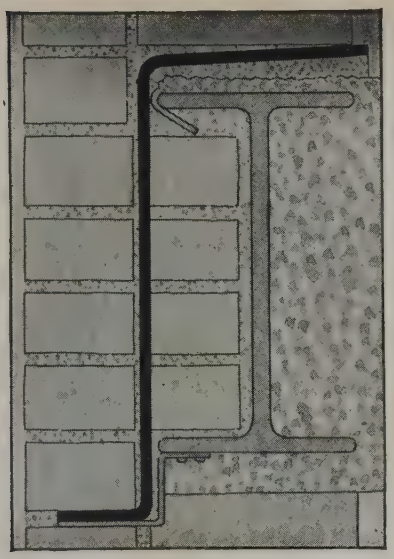
Cut-outs, wall chases, etc., shall be coated thoroughly before pipes, or other work is installed.

M-R Rubberseal Spandrel Cloth

The most effective method of dampproofing spandrel beams is the M-R system using M-R Rubberseal Spandrel Cloth as described in the following specifications:

Specification—***Scope of Work***—The work included in the drawings of these specifications consists of the dampproofing of the spandrel beams, excepting such work as may be specifically excluded.

Continued on next page



Standard M-R Method of Dampproofing the Spandrel

Application—All surfaces shall be dry and free from dirt and foreign matter. The general contractor shall leave the surfaces to be dampproofed troweled smooth; *all voids, including columns, shall be filled with cement mortar, leaving a slight bevel sloping towards the outside of the building.*

A blanket of M-R Rubberseal Spandrel Cloth shall be installed as per detail, starting 2 in. inside the line of the outside wall, extending out over the spandrel to edge of flange and then down to end of spandrel (or lintel), turning out on the face brick.

When the lintel is placed immediately under the spandrel beam, the blanket of Rubberseal Spandrel Cloth is to be turned out on the lintel, as described.

When the lintel is located more than 1 ft. below the bottom of the spandrel beam, then the Rubberseal Spandrel Cloth is to be turned out on the face brick at the bottom of the spandrel and a strip of Rubberseal Spandrel Cloth or a copper pan placed over the lintel. The cloth or pan is to extend 12 in. beyond each side of the lintel.

Material—Shall be M-R Rubberseal Spandrel Cloth, manufactured by the Mitchell-Rand Mfg. Co., *and shall be equal in every way to sample in architect's office.*

The raw fabric shall be coated with a composition of oxidized asphalt and stearine pitch, fluxed together so as to produce a compound of a rubbery nature not susceptible to temperature changes; i.e., it shall remain flexible in cold weather and shall not soften and run in summer.

The base fabric shall be 4 oz. per sq. yd., tensile strength 75 lb., and thread count 32x28 per sq. in.

M-R Stone Backing Compound

A black, alkaliproof and waterproof paint that protects granite, limestone, Bedford stone, marble or any other cut stone from chemical action and discoloration due to alkali in cement. One gallon applied by means of a 4 or 6-in. flat varnish brush will cover approximately 125 sq. ft. Packed in barrels, half barrels and 5-gal. pails.

Specifications—All surfaces in contact with masonry (the top, bed, sides, and back) are to be thoroughly coated to within 1 in. of the face to prevent staining. The surface of the stone should be dry and clean to insure adhesion; the coating should be continuous, even, and all Lewis holes, anchors, and recesses should be coated. After the cut stone is set it is advisable to apply an additional coat on the back.

M-R Colorless Compound

A colorless liquid for dampproofing the outside face of brick walls where it is undesirable to use a paint on account of such material changing the texture or color of the bricks.

Shipped in barrels, half-barrels, 5-gal. containers, and 1-gal. cans.

Specifications—***Preparation of Surfaces***—Point up all walls wherever necessary, and fill all spaces and voids around window frames and other openings. Walls shall be perfectly dry and surfaces free from foreign matter.

Application—All walls, sills and lintels shall be treated with 2 coats of M-R Colorless Compound, and in accordance with the directions of the manufacturer, the Mitchell-Rand Mfg. Co. The coats shall be applied on successive days, viz., one coat shall be applied when the surfaces are perfectly dry, as noted, and the other coat given the next day.

M-R Brick and Cement Coating

Made in standard colors and white. Used to waterproof and beautify surfaces of concrete, stucco, brick and plaster, both interior and exterior. It prevents hair-cracking and is absolutely waterproof.

Applied in same manner as ordinary paint. Due to its unique film structure, the dampness always present in cement and brick cannot cause it to peel and in this regard it is quite unlike oil paint.

It does not alter the texture of the surface to which it is applied. It dries to a soft, artistic, flat or mat finish which is an integral part of the surface itself, and it may be scrubbed and washed without injuring the film.

Specifications—Loose particles are to be thoroughly cleaned off the surface with a wire brush, and any appearance of salts removed with a solution of muriatic acid and water (1 part to 10) before the coating is applied.

Apply 2 coats of M-R Brick and Cement Coating, of selected color, with a full, wide, clean brush—brushing to settle it into place, only, and not for the purpose of extending it. Allow 24 to 48 hours between coats.

First coat may be thinned with 1 pt. of turpentine to the gallon. Second coat to be applied as received in the original package.

M-R Double Strength Waterproofing Paste

This is an integral waterproofing compound, used for making concrete, cement, mortar and stucco waterproof. It is very effective and in wide use.

It is a smooth plastic material. When used, it is first dissolved in the gauging water, which insures an even and uniform distribution throughout the mass. This method is decidedly economical, and makes possible the solution of different waterproofing problems; it is also very useful in connection with the repairs of a completed structure, as the operation is carried on entirely from the inside.

The material is shipped in barrels, half-barrels, 5-gal. containers, and 1-gal. cans.

Specifications—One gallon of M-R Waterproofing Paste dissolved in 35 gal. of water will waterproof 1 cu. yd. of concrete; 1 gal. of M-R Waterproofing Paste dissolved in 17 gal. of water will waterproof 100 sq. ft. of cement-finish floor, wall or stucco 1 in. thick; 1 gal. of M-R Waterproofing Paste dissolved in 35 gal. of water will waterproof 1 cu. yd. of dry cement and sand for laying up brick or stone walls.

M-R Liquid Waterproofing

This is a liquid with a calcium base, and is used in the gauging water for making concrete, cement mortar and stucco waterproof. It is also used for cement floors where a dense hard non-dusting waterproof finish is desired. Packed in 50-gal. barrels, half-barrels, and 5-gal. pails.

Specifications—M-R Liquid Waterproofing is mixed in the proportions of 1 gal. to 35 gal. of water. This gauging water is used to wet the aggregates in the usual way.

M-R Superior Cement Colors

These are imported iron oxide colors and are non-fading. In pulp or dry. They tend to retard excessive moisture absorption, even to the extent of making the concrete slightly waterproof. They are not susceptible to the action of cement alkalis. They are *all color,* neither lime or any other filler is added. Being unadulterated, *less* is required. As their name implies, they are superior in brilliancy and strength as many tests prove. They consist largely of metallic and mineral oxides, the small percentage of other color material being of such a nature that it has no injurious effect on the bond, cohesive ultimate and tensile strengths of concrete.

M-R Shield Brand Concrete Floor Wax

A high grade wax for treating and polishing old and new concrete floors. Readily cleaned. Gives high luster.

CAL

Products

CAL, for use in portland cement mixtures to obtain early strength; to improve curing; for densifying; for easy workability; as a hardener; and for placing in cold weather.

Also Acme, Helderberg and Security Portland Cement; Berkeley Hydrated Lime.

What Cal Is

Cal is oxychloride of calcium, a dry white powder which, used as an admixture to portland cement concrete and mortar, has a combination of properties which facilitate and expedite new construction and repairs.

What Cal Does

Cal accelerates the hardening of all portland cement concrete and mortar, bringing them to safe working strength in a fraction of the usual time. Just as it comes from the container, Cal is added at the mixer. From actual tests and job experience covering many years, it has been found that when Cal is used, forms may be removed from all kinds of work in much less than normal time; and that road and street construction can be put into full service in from 48 to 72 hours. Road patching can be accomplished with little interruption to traffic. In addition, Cal cures, fattens, hardens, and densifies all portland cement mixtures, and reduces the cold weather hazard.

Workability

Cal reduces the amount of water necessary in making concrete; it prevents the segregation of the aggregates, and makes a concrete mixture more easily workable and easier flowing.

Cal fattens and stabilizes a concrete mixture so that segregation is reduced to the minimum. This is of special importance in chuting concrete or in transporting from central mixing plants.

Curing

Cal prevents the too rapid drying out of concrete or stucco in very hot or dry weather, and thus minimizes the danger of surface cracks, checks, crazing and disintegration.

No Danger of Corrosion

Three-year laboratory tests under the most severe conditions have proven that Cal does not cause corrosion of steel reinforcement.

Cold Weather Work

A conservative analysis of the experience of users indicates that Cal makes concreting and masonry work safe at temperatures 10° lower than for plain concrete or mortar and that with proper additional precautions work may proceed at very low temperatures.

Effect on Strength

There are innumerable laboratory tests which show conclusively that Cal increases the early strength of concrete with no ill effect on the ultimate strength.

The report of American Bureau of Inspection and Tests, Chicago, showed 2450 lb. concrete in three days. The mix was 1:1½:2½ and contained 5 lb. of Cal per bag of cement. In the same series of tests 1:1½:3 concrete treated with 5% Cal by weight of cement gave 2220 lb. in three days. Tests were made in compression on 6x12-in. cylinders with commercial aggregates, and air storage.

Compression Tests

The following table is from tests by Duff A. Abrams, eminent authority on concrete testing. It is taken from Bulletin No. 13 Structural Materials Research Laboratory of the Lewis Institute.

Gulf Island Development Power House on the Androscoggin River

MORTON C. TUTTLE CO., Contractors

Cal used for densifying concrete in the scroll cases and for general frostproofing for the Central Maine Power Co.

Addition to Corcoran Art Gallery, Washington, D. C.

JAMES BAIRD CO., Contractors

Cal used for frostproofing the mortar used in laying up the face brick

Harris-Forbes Building, Boston, Mass.

LOCKWOOD, GREEN & CO., Architects

GEORGE A. FULLER CO., Contractors

Cal used for brick mortar and for reinforced concrete roof slabs, without interruption at temperatures as low as 5° F.

Continued on next page

The effect of Cal on the tensile strength of mortars is similar to its effect on the compressive strength of concrete.

Compression Tests of 6x12-in. Concrete Cylinders—Mix 1:5:2 by volume (1:2:4). Aggregate: sand and pebbles from Elgin, Ill., graded 0 to 1½ in. Cement: portland cement "A" purchased in Chicago. Relative consistency, 1.00 (flow about 180). Specimens cured in moist room until test, tested damp. Each value is the average of from 4 to 10 tests made on different days unless otherwise noted. Strength ratios are percentages of the strength of concrete at same age without admixture. Admixture expressed as per cent of weight of cement.

The Cal Book

The complete story of Cal is contained in this book which will be sent to any architect on request.

Specifications

All portland cement [concrete] [mortar] [stucco] [finish] shall be treated with Cal, manufactured by the North American Cement Corporation. Cal shall be used in the proportion of .... lb.* per bag of cement and shall be added dry to the mix, according to directions issued by the manufacturers.

*In normal temperatures, the following quantities should be used:

For stucco	5 lb.	Surface wash	8 lb.
Densifying	4 lb.	Easy chuting	5-8 lb.
Bonding and patching	5 lb.	For maximum acceleration in any portland cement mixture	8-lb.
Brick mortar	5 lb.		
Brick mortar	5 lb.	For impermeability in any 1:2:4 or richer mix	4 lb.
Floor topping	3 lb.		
Concrete products	5 lb.		

For cold weather, the following "Schedule of Safety" should be followed:

SCHEDULE OF SAFETY FOR COLD WEATHER

Nature of work	Temperature	Precautions
Floors, walls, brick mortar, roads and streets, mass concrete	Above 20° F.	Aggregates free from frost; 5 lb. Cal per bag cement
Stucco and thin sections	Above 25° F.	
Floors, walls, brick mortar, mass concrete	15° F. to 20° F.	Heat water and aggregates; 8 lb. Cal per bag cement
Stucco and thin sections	20° F. to 25° F.	Heat water and aggregates; 5 lb. Cal per bag cement; protect all exposed surfaces
Floors, walls, mass concrete	10° F. to 15° F.	Heat water and aggregates; 8 lb. Cal per bag cement; protect all exposed surfaces

Where to Get Cal

Building material dealers in most important cities carry Cal in stock. Orders may be sent to any office of the company, to be filled from nearest dealer's stock. Prices on request.

How Cal Is Packed

Cal is packed in convenient non-returnable 100-lb. heavy paper-lined burlap bags which preserve the material indefinitely when stored in a dry place.

NATIONAL WATERPROOFING CO.

Waterproofing Engineers and Contractors
1077-1081 Columbus Avenue
BOSTON, MASS.

Products and Services

ENGINEERS and CONTRACTORS for WATERPROOFING, DAMPPROOFING and OILPROOFING.

KENNELLY'S LIQUID (INTEGRAL) WATERPROOFING and OILPROOFING for concrete.

KENNELLY'S DAMPPROOFING PAINT and COMPOUND.

KENNELLY'S CONCRETE FLOOR HARDENER.

General

We will absolutely guarantee all waterproofing done by us to be watertight. We will dampproof without discoloring the outside of any concrete, brick or stone structure and will guarantee the work to be absolutely moistureproof. We will apply a floor hardener to any concrete surface and guarantee the work against dusting or softening of the surface. All work done by us will be carried on in such a manner that no delay will be caused the general contractor or any part of the work.

Engineering Department

Our engineers are always at the service of architects, engineers, contractors and owners for the solution of waterproofing problems, for preparing specifications and for estimating the cost of waterproofing all concrete structures, foundations, tunnels, dams, reservoirs, swimming pools, etc.

Kennelly's Liquid Waterproofing (Integral Method)

Kennelly's liquid waterproofing is an integral waterproofing liquid which crystallizes in the mass as the cement sets, sealing completely and permanently the voids or pores between the sand and cement against the passage of liquids, even under heavy pressure. It is used in concrete or cement mortar to prevent the penetration of water or dampness. Having practically the same specific gravity as water, it immediately becomes part of the tempering water when poured into the barrel, thus becoming evenly distributed throughout the mass. Kennelly's liquid waterproofing not only renders concrete, mortar and stucco permanently impervious to water, but prevents discoloration and efflorescence, gives additional protection to the reinforcement and increases rather than decreases the strength of the mass. It does not affect the color or setting of cement mortars or concrete.

Kennelly's Plaster Waterproofing

If a watertight plaster finish is desired, put the compound into the water used in making mortar and then place the mortar on the surface to be covered and work it out to the desired finish. By this method, concrete, cement mortar and stucco are rendered permanently moistureproof and pressureproof, the finished surface is not discolored, and the strength of the concrete is increased rather than decreased.

Kennelly's Exterior Dampproofing (Colorless)

A colorless liquid for dampproofing exterior surfaces of stucco, brick, stone and concrete masonry. Also extensively used as a sizing for lime plaster on interior walls before paint is applied. It is applied with a brush. Efflorescence and blotches are caused by the absorption of atmospheric moisture and exudation of gypsum and lime. By the use of our dampproofing, we have overcome these disfiguring features without discoloring the original surface or joints.

We will guarantee to make any building dampproof by this method at a reasonable cost.

Kennelly's Interior Dampproofing (Dark)

A compound for coating interior surfaces of brick, stone or hollow tile walls. Forms a continuous waterproof film or coating on the surface, completely sealing walls and preventing penetration of moisture. This method eliminates furring and lathing and thus effects a great saving, as the plaster may be applied directly to this coating.

Kennelly's Concrete Floor Hardener

A liquid compound either *mixed with the concrete* finish in new floors *or applied to the surface* of old as well as new floors. In buildings subject to heavy wear, the dusting of a concrete floor induces disintegration and crumbling of the concrete and thus ruins the floor. Our hardener insures against dusting, and provides a non-absorbent surface, more impervious to wear than ordinary concrete, makes a durable top surface, and provides a sure non-slip foothold.

Specifications

Integral Waterproofing and Oilproofing—To each 50 gals. of water (1 bbl.) used in tempering the mass concrete, add 6 qts. of Kennelly's Liquid Waterproofing, thoroughly mixing the concrete and carefully spading it into place so as to avoid stone pockets.

Plaster Waterproofing—Material used in same proportion as for integral work, mixing the waterproofing with water used in making concrete mortar and then placing the mortar on the surface to be covered, using 6 qts. of waterproofing to 50 gals. of water.

Dampproofing—Thoroughly clean surfaces to be dampproofed by washing with warm water. Allow to dry, and then apply dampproofing with brush, covering surface well. Allow 4 or 5 hours to elapse before making second application, and when thoroughly absorbed, make a third application.

Concrete Floor Hardener—First thoroughly clean the floor surface to be treated by scrubbing with warm water, thereby removing all foreign particles, etc. Allow to dry, and then apply the floor hardener with brush, covering the surface well and allow to dry for at least 4 or 5 hours before making a second application. Should any dry spots appear, treat with another coat of hardener.

THE OBELISK WATERPROOFING COMPANY

Caffall Process—the Heat Method

TELEPHONE
ASHLAND 1740, 1741

1 Madison Avenue
NEW YORK, N. Y.

BOSTON OFFICE: 950 Park Square Building—Telephone Hancock 0033

Services

Exterior Surfaces of Stone, Brick and Stucco Buildings, above grade, TREATED with the CAFFALL PROCESS, the Heat Method.

Business, Residential and Monumental Buildings and Churches Restored, Dampproofed and Preserved; Exteriors of Delicate Marble Preserved from Weather Disintegration; Monuments Restored and Preserved.

Guarantee

Work done under contract with a 10-year guarantee, or a cost-plus-percentage basis without guarantee.

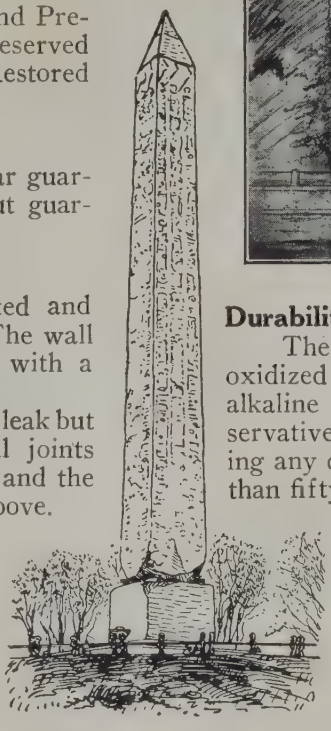
Process

New Structures—The surface is tested and structural defects, if any, are made good. The wall is then impregnated to considerable depth with a melted wax compound forced in by heat.

Old Structures—Where masonry walls leak but material disintegration has not occurred all joints are tested and made sound where necessary, and the entire surface, including joints treated as above.

Where the surface has disintegrated from weather attack, it is restored to sound condition, joints are re-pointed, and the entire surface treated as above. The treatment leaves the appearance unchanged, and one treatment will last for the life of the building.

It will be understood that application of heat to buildings, particularly to fine marble and granite, requires expert skill. Heat dries out the surface and forces penetration of preservative material. On cooling, the wax congeals and becomes an integral part of the material at and below the surface.



Obelisk or Cleopatra's Needle
Restored and preserved by Caffall Process, the heat method, in 1885

Plymouth Rock
Treated 1921

Durability

The principal components can not be easily oxidized and are insoluble in water, acidulated or alkaline solution, or gases. This is the only preservative process having a successful history covering any considerable period. Buildings treated more than fifty years ago are still dry.

Cost

Cost can be ascertained on application to the company. It is determined by the following elements:

Character of material to be treated.

Condition, whether newly erected, old, or requiring renovation.

Area requiring treatment.

Character of surface, whether plain or ornamental.

Location of building or monument.

PERMANENT WATERPROOFING CO.

Engineers and Contractors for Waterproofing

Delaware Corporation

CHICAGO, ILL., 224 South Michigan Avenue
PITTSBURGH, PA., 1213 Chamber of Commerce Building
NEW YORK, N. Y., 40 East 34th Street

Missouri Corporation

KANSAS CITY, MO., 407 Dwight Building
SAN FRANCISCO, CALIF., 625 Underwood Building

Services

Waterproofing is a specialized engineering problem, requiring study and wide experience with all materials and methods, used under all sorts of conditions.

Nearly fifteen years of experience, and an organization reaching from *coast to coast,* is at your service. This applies to Basement Walls and Floors, Pits, Tanks, Swimming Pools, Cisterns, Tunnels, Subways, Concrete Bridges, Retaining Walls, Roundhouses, Piers, etc.

Material

The PERMANENT WATERPROOFING CO. adopts the material best adapted to the conditions which must be met, as a rule the material used being an iron compound.

Application

The waterproofing can be applied to either the *Inside* or *Outside* surfaces of walls after all forms are removed, and to the top of rough floor slabs and footings, in the form of brush coats or in combination of brush and plaster coats.

Appearance

The finished surfaces are left with a finish and color similar to cement brush coat or cement plaster. The surface in either case may be plastered or painted or finished with any type of cement, marble, or terrazzo surfacing.

Paint will not be discolored.

Resistance to Pressure

Applied either upon the inside or outside of walls, this waterproofing will resist any hydrostatic pressure which the wall is capable of withstanding.

Permanency

This material is not a simple coating, subject to injury by ordinary wear and abrasion or by changing atmospheric conditions. It will not "slump," crack or scale. It possesses much chemical vitality and in combination with water becomes very active. It works its way into the pores of the concrete, expands and unites chemically as well as mechanically with the structural materials, forming a strong and impenetrable mass.

The depth of the penetration varies in accordance with the porosity of the masonry—being greatest where the voids are most numerous and seepage most likely. The result is a surface which is part of the wall or slab and can not be removed without actual cutting. Not only does the material form a *permanent waterproofing,* but it also serves as a preservative and strengthener of the masonry.

Bonding Qualities

It is indispensable where a perfect bond between rough slabs or walls and finish coatings of cement, terrazzo, marble, tile, etc., is required.

Working Conditions

The efficiency of any material or methods depends in the last analysis upon workmanship.

The material is mixed with water, and the work can be done at a time when the working conditions are most favorable. This makes possible the highest class of workmanship when combined with the employment of intelligent experienced workmen, properly directed.

Outstanding Features

Waterproofing placed upon the *inside* or *outside* of wet walls, which penetrates and becomes part of the walls or floors.

Waterproofing which actually increases, rather than decreases, the strength and efficiency of the concrete, stone or brick.

Waterproofing which is continuous and assures (instead of breaks) the bond between footings and walls. This should be considered in case of lateral pressures.

Waterproofing which introduces no foreign or injurious materials into the concrete.

Waterproofing which assures bond between rough surfaces and finish and which is not injured by contact or vibration.

Waterproofing which eliminates the necessity for double or protective walls and slabs.

Waterproofing which offers peculiar resistive qualities to sulphurous fumes, gases, acids, fire and electrolysis.

Waterproofing which may readily be repaired in case of structural cracks.

Waterproofing which is *less expensive* than any other real waterproofing.

Waterproofing which is absolutely *guaranteed.*

Specifications

Walls—All outside walls and areas exposed to seepage shall be waterproofed by the PERMANENT WATERPROOFING CO.'s method on the inside surfaces from floor level to outside finished grade level. This work to be done before partitions or other obstructions are installed.

Inside walls and columns extending through the basement slab shall be waterproofed or dampproofed as may be required —upon both sides from the top of the footings to the outside finished grade level.

Floors—After the rough slab has been poured and sufficiently set it shall be thoroughly cleaned and waterproofed according to PERMANENT WATERPROOFING CO.'s method, and finished with a slush containing good sharp torpedo sand to give a good bond surface for the topping. This work shall be done before partition walls, machinery bases, conduits, etc., are placed.

Immediately before the topping is applied wash this surface well and apply a bonding coat of cement and Permanent Waterproofing and thoroughly brush into the slab. Apply finish in the usual way.

Disintegration Problems

The disintegration of concrete, brick and stone surfaces has been studied by us for a number of years. During that time we have handled a number of problems of this nature, and have also made a number of tests under field conditions. We would be pleased to furnish detailed information regarding them.

THE SANDUSKY CEMENT COMPANY

Manufacturer of Medusa Integral Waterproofing

CLEVELAND, OHIO

BRANCH OFFICES

CINCINNATI, OHIO, Builders Industries Building
CHICAGO, ILL., 1016 The Builders Building
NEW YORK, N. Y., 350 Madison Avenue
TOLEDO, OHIO, 1004 Second National Bank Building
YORK, PA., 60 Lehmayer Building

PLANTS

BAY BRIDGE, OHIO · SILICA, OHIO · DIXON, ILL. · YORK, PA. (2)

Product

MEDUSA WATERPROOFING, the standard of integral waterproofing quality for twenty years, in either Powder or Paste form—the original integral concrete waterproofing.

For Medusa Portland Cements, see pages A43-47; for Medusa Portland Cement Paint, see page B2131.

Output

3,000,000 lbs. of waterproofing.

Packages

Medusa Waterproofing Powder is furnished in 40-lb. paper lined cloth sacks. A quart weighs one pound.

Medusa Waterproofing Paste is furnished in metal containers, with large friction seal tops, 1 gal. (8 lbs.) and 5 gals. (40 lbs.) each, packed for shipment in substantial crates of six 1-gal. or two 5-gal. cans each. A pint weighs 1 lb.

Literature

New Medusa literature, in standard size 8½x11 in., describing many uses for Medusa Waterproofing Powder and Paste, will be sent on request.

Uses

Medusa will give positive waterproof and dampproof results in construction of concrete reservoirs, water towers and tanks, swimming pools, tunnels, disposal plants, pumping stations, elevator pits, stucco, basement walls and floors, cisterns, cement blocks, cast stone, etc.

Medusa Waterproofing Comes in Two Forms

Medusa Waterproofing Powder — Medusa Waterproofing Powder is white, finely ground and highly water-repellent. When mixed with any reliable brand of plain portland cement, in proper proportions, it is uniformly distributed through the concrete, being entrapped or held in place by the cement, sand and aggregate. Due to its water-repellent nature, it prevents the absorption or percolation of water, ground or drainage water, spring water, dampness or moisture from the earth or atmosphere.

For every bag of portland cement used, mix 2%, or 2 lbs., of Medusa Waterproofing Powder if you want absolutely waterproof concrete.

Medusa Waterproofing Powder is furnished in 40-lb. paper lined cloth sacks, enough to mix with and thoroughly waterproof, 20 bags of portland cement.

Medusa Waterproofing Paste—Medusa Waterproofing Paste contains the same percentage of water-repellency as Medusa Waterproofing Powder. Its effect on the concrete mass is exactly the same as that of Medusa Waterproofing Powder. It is a heavy paste, to be dissolved in the gauging water used to mix the concrete.

Two per cent of Medusa Waterproofing Paste by weight of the cement, or 2 lbs. per sack, is the correct proportion to render concrete and cement work permanently waterproof.

Integral Method of Waterproofing

Since the earliest days of the manufacture of portland cement in this country, the need for preventing the absorption of water by concrete has been fully recognized. Concrete contains many microscopic pores or capillary tubes constituting from 20% to 40% of the cubic contents. Water enters concrete because of the physical law of capillary attraction and its natural absorptive qualities. To make it waterproof, the absorptive properties must be destroyed.

Medusa Waterproofing becomes an inseparable part of the concrete itself. Designed to be mixed with concrete, to lubricate the particles and form an integral part of the mixture, it thus becomes an inseparable part of the mass, being tightly sealed within the concrete.

Medusa Waterproofing will positively and permanently render concrete dampproof and waterproof.

The integral method of waterproofing is economical, it does not require additional excavation on the exterior of basement or foundation walls, it does not require additional brick or concrete protecting walls, no difficulty experienced in making joints around pipes and at the bottom of outside walls, at footings, at junction of the basement floors and footings, and wherever horizontal or vertical joints occur. Blind leaks are not possible in integral waterproofing. Leaks due to settlement cracks can be economically repaired.

Waterproofed Cement Plaster Coat Method

This is a permanent and inexpensive method of rendering *a completed concrete or masonry structure dampproof and waterproof.* The fact that it results in a clean, neat and pleasing surface renders its use satisfactory for plastering or lining basement walls, for surfacing floors, and other interior work.

A Word as to the Quantity of Waterproofing Needed

Though somewhat less than the quantity recommended may be used in many cases with excellent results, it has proved advisable in any structural work to have a reasonable factor of safety.

The need of such a factor of safety will be appreciated when the varying conditions affecting concrete work are considered.

Specifications vary considerably and so also do the aggregates selected.

It has been found that the quantity prescribed, 2% of the weight of cement (8 lbs. to the barrel) is the correct amount to be used. A reasonable factor of safety is included in this figure and we advise that this specification be rigidly maintained.

SOLVAY SALES CORPORATION

Alkalies and Chemical Products Manufactured by The Solvay Process Company

40 Rector Street, NEW YORK, N. Y.

BRANCH OFFICES

BOSTON, MASS. SYRACUSE, N. Y. CHICAGO, ILL. DETROIT, MICH. CLEVELAND, OHIO INDIANAPOLIS, IND.
CINCINNATI, OHIO PITTSBURGH, PA. ST. LOUIS, MO. ATLANTA, GA. KANSAS CITY, MO. PHILADELPHIA, PA.

Solvay Calcium Chloride for Curing, Densifying and Accelerating the Setting of Concrete

A white, dry, flaky chemical which when added to the mixing water accelerates the initial hardening of concrete without affecting the final set; at the same time densifies the concrete, making it more waterproof; reduces the freezing point of water, thereby aiding the fresh concrete to resist freezing in low temperatures. Solvay Calcium Chloride is extremely hygroscopic and dissolves almost instantly in water. It can be used with any brand of portland cement, although results may vary slightly.

Comparative Strength Ratios between Treated and Untreated Concrete—After testing 7500 compression specimens, Prof. Duff A. Abrams, then in charge of Structural Material Research Laboratory of the Lewis Institute, Chicago, Ill., concludes:

"In the use of Calcium Chloride no advantage was gained for percentages of the commercial product greater than 2 or 3 per cent, corresponding to a chloride content of 1 to 1½ per cent. This amount when used in mixes of about 1:5 and in consistencies suitable for building construction, showed an increase in strength of from 100 to 200 pounds per square inch. For richer and drier consistencies the strength increase was greater and for leaner mixes and wetter concretes it was less."

Accelerating Effect—As shown by tests, concrete gauged with Solvay Calcium Chloride, at the end of 48 hours has the same strength as concrete gauged with plain water has at the end of 7 days. The early strength given to fresh concrete prevents collapse of the cell structure during the drying out period. It increases the crushing, tensile and abrasive strengths.

With Solvay Calcium Chloride, floor finishing is possible within a short time after pouring; concrete can be poured late in afternoon and finished, saving overtime charges.

Results Proven by Authoritative Tests—Thorough and extensive tests made by U. S. Bureau of Standards, American Society for Testing Materials, Portland Cement Association, U. S. Engineers, Lewis Institute and our own engineers have definitely established that Calcium Chloride is beneficial to concrete.

At an investigation, carried on by the Bureau of Standards, co-operating with U. S. Engineers at Memphis, Tenn., with many materials, Calcium Chloride showed highest. In the standard mortar test with 3:1 Ottawa sand, it was found that 2% to 4%, by weight of water, of commercial Calcium Chloride increased tensile strength from 155 to 230% at the end of 24 hours; and from 173 to 190% at the end of 48 hours without adverse effect on the final set.

Curing—The use of Solvay Calcium Chloride provides a most practicable method of curing structural concrete.

The forms on concrete afford it some protection against premature drying out. This alone, however, is not sufficient to insure the amount of moisture which concrete must have to attain its maximum strength. Solvay Calcium Chloride incorporated in the mix supplies this need readily by attracting and holding this needed moisture. Complete hydration can then take place naturally and the concrete is enabled to attain its full strength in much less than the usual time.

Workability—Addition of Solvay Calcium Chloride increases the workability of concrete. Experiments on workability conducted by the New Hampshire State Highway Department indicated that the power required to mix concrete is reduced 20% by the addition of 2% of Calcium Chloride.

Advantage of Use in Cold Weather—The qualities of quick initial setting, hardening, densifying and reducing of the freezing point of the mixing water make it possible to progress with concrete work in continued cold weather when using Solvay Calcium Chloride.

A. R. Lord, in his notes on "Wacker Drive" (A. C. I. Proceedings, 1927, p. 59-61) states: "Our 6 and 12 months' tests, while too few in number to be at all conclusive, indicate that concrete placed under cool temperatures in April and May never catches up with that placed under midsummer temperatures."

The usual precautions against cold weather must be taken, but the factor of safety is very materially increased by the use of Solvay Calcium Chloride.

Efficient solutions for use in freezing weather, using 6 gal. of water per bag of cement, are at 28° F., 2 lbs. to 6 gal. of water; 20° F., 3 lbs.; 15° F., 4 lbs.

Waterproofing Qualities—The integral method of waterproofing concrete has been found best by many engineers and architects. The same qualities of hardening, densifying and quick initial setting brought about by Solvay Calcium Chloride tend to make treated concrete more waterproof.

Directions for Using Solvay Calcium Chloride—For the best results, use not less than 1 lb. nor more than 4 lbs. to a bag of cement except in freezing weather when up to 6 lbs. may be used. Solvay Calcium Chloride should be dissolved in the water before water is added to dry mix.

Estimate of amount to be used is approximately 2 lbs. per bag of cement—conditions of temperature, location, mix, etc., will vary this amount.

Cost—Solvay Calcium Chloride, east of the Mississippi, costs, approximately, two cents per pound—in the far West cost is slightly higher.

Shipment—Solvay Calcium Chloride is shipped in metal drums containing 375 lbs. net, and in moisture-proof bags containing 100 lbs. net. In bags it must be given same care as cement. Stock is carried in 75 cities in the United States. Special arrangement for handling carload lots.

Typical Jobs

Solvay Calcium Chloride has been specified by many of America's leading architects, engineers and contractors. A few of the buildings in which it has been used for the purposes described are:

Chicago Tribune Building, Chicago, Ill.
Lincoln Safe Deposit Building, New York, N. Y.
Montreal Rail and Water Terminals
Maccabees Building, Detroit, Mich.
Sesqui-Centennial Stadium, Philadelphia, Pa.

Technical Service

The Solvay Process Company maintains a Technical Service Department whose services are gladly rendered without charge to engineers and architects.

Literature

The new comprehensive booklet, "Solvay Calcium Chloride in Concrete Construction", together with Architects' Specification sheet, will be sent without charge upon request.

SOMMERS & CO., LTD.

Manufacturers of Permantite Waterproofing Products

342 Madison Avenue, NEW YORK, N. Y.

Products

PERMANTITE TRADE-MARK

PERMANTITE CONCENTRATED LIQUID INTEGRAL WATERPROOFING.

DAMPPROOFING PAINTS AND COATING.

Also Liquid Integral Cement Hardener; Gray Elastic Cement; Cement Colors; Anti-Freeze; Steel Coating; Foundation Coating; Stone Backing Paint; Semi-mastic Dampproofing; Mastic Dampproofing; Liquid and Plastic Asbestos Roof Coating; Cement Floor Hardener; Cement Floor Coating; Transparent Dampproofing; Masonry Coating in colors; Waterproofing Fabric; Shingle Stains; Technical Paints and Varnishes.

Services

SOMMERS & CO., LTD., are sole manufacturers of Permantite Waterproofing Products.

The personnel of SOMMERS & CO., LTD., includes waterproofing engineers and construction specialists. These men, with their sixteen years' experience, are at the disposal of architects and engineers, and will be glad to aid in solving waterproofing problems. Where necessity demands special products, Sommers' chemists will gladly work them out in the laboratory.

Permantite Concentrated Liquid Integral Waterproofing

A concentrated liquid waterproofing compound for waterproofing concrete and cement mortar.

Placed in the gauging water of the concrete, or added directly in the mixer, it acts as a lubricant and densifier of the concrete, reducing the power of absorption and the permeability of the mass. In addition, it will hasten the initial set and give added early strength when most needed. Used in cold weather it will reduce the freezing point of the water.

Advantages of Permantite—Effectiveness; permanence; simplicity of use; low first cost. Permantite concrete, owing to decreased porosity is resistant to acids and alkalis. Permantite has a lubricating action on the cement which causes the concrete or cement mortar to become more plastic and workable, producing a smoother and more waterproof surface than untreated concrete.

Tests—Tests show that Permantite Concentrated Liquid Integral Waterproofing in addition to waterproofing adds to the early strength of concrete—the time when strength is most needed. Tests of specimens cured in air show Permantite to be effective in increasing the impermeability and the strength of concrete and cement mortar at all ages.

Quantity to Be Used—1 gallon to cubic yard of 1-2-4 concrete. 1 gallon to 100 square feet cement mortar 1-in. thick. 1 gallon to 1000 brick, 1-3 mortar. 1 gallon to 25 square yards of stucco.

Packages—Shipping weight, 11 pounds per gallon. Put up in 55-gallon drums, 30-gallon half drums, 5-gallon pails.

Specifications—In all concrete and cement mortar throughout there is to be incorporated Permantite Concentrated Liquid Integral Waterproofing as manufactured by SOMMERS & CO., LTD., 342 Madison Avenue, New York, N. Y., and in accordance with their directions.

Damp-Proofing Coating

Damp-Proofing Coating is a black, elastic, full bodied, slow drying, waterproofing and dampproofing compound for application with a brush to the interior surfaces of exterior brick or terra cotta walls, to which gypsum plaster is to be directly applied.

Forms a perfect bond for gypsum plaster (not portland cement mortar) applied directly to the treated surface. Prevents the penetration of water and dampness, and renders the inside of walls proof against vermin and stains. Saves the cost of furring and lathing.

Damp-Proofing Coating is a composition of gilsonite and other asphaltic gums fluxed and blended with vegetable pitches, virgin rubber latex, non-volatile oils, and petroleum distillates.

The intimate combining and proportioning of these ingredients make duplication most difficult; substitutes for Damp-Proofing Coating have therefore been almost impossible.

Damp-Proofing Coating has been used successfully in all climates. It will resist the freezing temperatures of our most northern countries, as well as the humid torrid climates of the tropical zones.

Covering Capacity—Average covering capacity is 80 square feet to the gallon, one coat, depending upon the porosity of the surface to which applied.

Packages—Shipping weight, 9 pounds per gallon. Put up in 55-gallon drums, 30-gallon half drums, 5-gallon pails, 1-gallon cans (6 to a case).

Specifications—The interior surfaces of exterior brick and terra cotta walls above grade shall be dampproofed with Damp-Proofing Coating as manufactured by and in accordance with the directions of SOMMERS & CO., LTD., New York, N. Y.

Damp-Proofing Coating shall be delivered at the building site, ready for use, in the original unbroken packages.

SOUTHWESTERN DISTRIBUTORS: SONNEBORN BROS., DALLAS, TEX.

Products

"LAPIDOLITH," the Liquid Chemical Hardener and Dustproofer for concrete and terrazzo floors.

"SONNEBORN'S CEMENT FILLER and DUSTPROOFER" for cement floors (transparent and in colors).

"HYDROCIDE" WATERPROOFING PRODUCTS for interior and exterior surfaces.

"LIGNOPHOL," a Preservative for wooden floors.

"CEMCOAT," an Improved Mill White.

"CEMCOAT" FLOOR ENAMEL.

"SONOTINT," a Flat, Washable Wall Coating.

"STIP-EL-ART," for interior stippling or texturing.

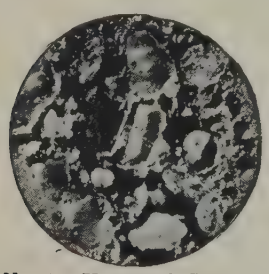
Also Amalie Structural Steel Paints, Galvacote, a coating for galvanized iron; Amalie Pipe Enamel; Amalie Radiator Enamel; Amalie Stack and Boiler Paints; Amalie P & D House Paints; Enamelife.

Hardening, Dustproofing and Waterproofing Old or New Concrete Floors

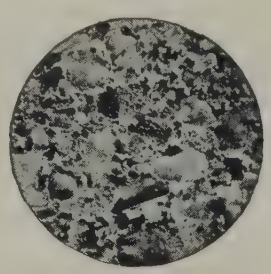
"Lapidolith"—A liquid LAPIDOLITH TRADE MARK chemical which penetrates concrete floors, rendering them hard, dustproof, wearproof and watertight. When applied to old concrete floors, "Lapidolith" will prevent further dusting and disintegration. It does not change the color of concrete.

An Investigation of the Action of "Lapidolith" on Concrete—Following is an extract from the official report of Prof. R. J. Colony of Columbia University, New York, as the result of an examination by him, under the microscope, of treated and untreated concrete:

"The external application of 'Lapidolith' to concrete surfaces results in (a) the formation of an optically isotropic but crystalline substance, derived by a reaction between components of the 'Lapidolith' and the cement matrix of the concrete which (b) has a tendency to fill in voids and cavities and act as a binding agent, thus rendering the surface smoother and more uniform."



No. 1. Untreated Concrete



No. 2. Lapidolized Concrete

Microphotographs of Specimens of Concrete
Magnified 50 diameters

No. 1. Note large numerous voids (black spots) and roughness of surface.

No. 2. Note roughness is reduced and voids filled with network of newly formed hard crystalline substance

Application—"Lapidolith" is mixed with water and flushed on the floor as per detailed directions to be furnished.

Special Service Work—We also contract to apply "Lapidolith" with our own men under the supervision of a service engineer on areas of 20,000 sq. ft. or over at a substantial saving to the owner in material and labor.

Specification for Concrete Floor—Harden and dustproof the following concrete floor (.....) or as noted on the drawings with 3 applications of "Lapidolith," manufactured by L. SONNEBORN SONS, INC., New York, N. Y., and applied as per their directions.

Filling and Dustproofing Concrete Floors Subject to Light Wear

"Sonneborn's Cement Filler and Dustproofer," for concrete floors where there is no excessive wear. Furnished either transparent or in a number of attractive shades. Covering capacity per gal., 1 coat, is 350 sq. ft.; 2 coats, 200 sq. ft.

Specification—Fill and dustproof the following cement floors (.....) with 2 coats of "Sonneborn's Cement Filler and Dustproofer" manufactured by L. SONNEBORN SONS, INC., New York, N. Y., applied as per manufacturer's directions.

"Hydrocide" Waterproofing Products

"Hydrocide" No. 633 (Also Hydrocide Mastic and Semi-mastic)—Plaster bond for dampproofing the inner surfaces of outside walls above foundations.

Ready for use, applied cold with a brush. Saves furring and lathing expense. Should not be applied to smooth concrete surfaces which are to be plastered unless walls are sufficiently roughened. Covering capacity per gal., 1 coat, is 65 to 100 sq. ft.

"Hydrocide" Mastic and Semi-mastic (Also Hydrocide No. 648)—For waterproofing outer surface of foundation walls and footings.

Ready for use, applied cold with a brush. Covering capacity per gal., 1 coat, is 65 to 100 sq. ft.

"Hydrocide" No. 611—For the protection of unexposed surfaces of limestone, caen stone, marble and other fine stones, from stain caused by absorption or communicated by surrounding masonry. Covering capacity from 250 to 350 sq. ft. per gal.

"Hydrocide" Integral Waterproofing (Powder, Paste, and Liquid)—For waterproofing mass concrete, concrete walls, floors, cement stucco and mortars, etc. Mix 2 lb. of powder with each bag of portland cement, then add the sand and stone mixture. Use 1½ qt. of a mixture of equal parts of paste and water for each bag of cement. Use 1 gal. of Liquid for each 10 gal. water, or 1½ gal. for each cubic yard of concrete, 1 gal. for each 100 sq. ft. of 1-in. floor topping.

Continued on next page

Waterproofing Exterior Walls Above Grade without Changing Appearance of Walls

"Hydrocide Colorless" contains no wax, paraffin or similar substance disfiguring the surface.

Grade "A" for light colored surfaces, such as plain concrete and stucco, etc.; "B" for red and buff brick, colored concrete and stucco; "D" for very porous surfaces, such as limestone, concrete cast stone, etc. that are of light color.

Preservative for New and Old Wood Floors

"Lignophol" is a preservative composed of natural wood gums and oils. It penetrates to a considerable depth below the surface of a wood floor, filling the voids in and between the cells and fibers. Prevents splintering, cracking, warping and dry and wet rot.

LIGNOPHOL FOR WOODEN FLOORS TRADE-MARK

"Lignophol" also acts as a dampproofer and dustproofer. Contains a powerful fungicide which checks the growth of fungus and mold. It prevents the disintegration of the wood fibers. It makes floors resilient and more resistant to heavy traffic and wear.

"Lignophol" is satisfactory for wood floors of all kinds in office buildings, churches, schools, hospitals, factories, bakeries, laundries—in fact, in all buildings.

"Lignophol Wax Finish"—For dance floors, residence floors and wherever a medium or high gloss is desired. One coat produces a medium gloss; 2 coats produce a high gloss. Lignophol Wax Finish is also very satisfactory for wood trim.

Covering Capacity—One gallon covers about 350 sq. ft., 1 coat, or about 200 sq. ft., 2 coats. New floors require 1 coat; floors subjected to heavy traffic and old floors should receive 2 coats. Furnished in 4 colors: natural, light oak, medium oak and dark oak.

Specifications—After scraping, all wood flooring shall be given 1 application of Lignophol, manufactured by L. Sonneborn Sons, Inc., New York (color to be selected) and applied in accordance with manufacturer's directions. (Specify 2 coats for floors subjected to heavy wear.)

Lignophol Wax Finish—For medium gloss: After scraping, all wood flooring shall receive 1 application of Lignophol Wax Finish, manufactured by L. Sonneborn Sons, Inc., New York (color to be selected) and applied in accordance with manufacturer's directions. About 6 hours following application, the surface should be polished. (For high gloss specify 2 coats. Apply second coat after first coat has been polished.)

"Cemcoat," a Sanitary, Washable, Light-reflecting Enamel Paint for Interior Walls and Ceilings

A white enamel paint which will stay as white as the most expensive enamels. Very opaque, 2 coats will cover as well as 3 coats of ordinary lead and oil paint. Is not poisonous. Is sanitary, can be washed with soap and water or even with a hose without affecting the surface. Will not peel, crack or blister if properly applied to a normal surface.

Cemcoat TRADE-MARK

For Interior Walls—Can be used on concrete or any other masonry materials, wood or metal. A coat of "Cemcoat" flat undercoat followed by a coat of "Cemcoat" finish will give best results. For very porous surfaces, 1 coat *each* of Amalie Gypsum Size, "Cemcoat" Undercoating and "Cemcoat" Finish.

White Flat "Cemcoat" Finish—Scientific laboratory tests have proven that it gives the unusual reflection factor of 86%, contrary to long established theory that gloss paint has the greatest reflective properties.

Eggshell and Gloss "Cemcoat" Finish—Eggshell is recommended for offices, schoolrooms, etc.; Gloss for conditions involving moisture, steam and other cases requiring this type of finish.

Colors—Made in all standard colors.

Covering Capacity—Approximate number of square feet per gallon, per coat:

	First Coat	Second Coat
Concrete	250	300
Brick	250	300
Plaster	300	350
Wood	400	450
Metal	400–500	500–600

Exterior "Cemcoat" for Exterior Walls

For decorating and dampproofing exterior walls above grade. Comes in 12 attractive colors, flat or gloss finish.

Covering Capacity—On concrete, brick, stone and stucco, approximately 175 sq. ft. for 2 coats; on wood and metal 250 sq. ft. for 2 coats.

"Cemcoat" Floor Enamel for Cement Floors

Exceptionally elastic and durable; will successfully stand up where ordinary floor enamels would fail. Dries in 24 hours to a glossy washable film. Eight attractive colors.

"Cemcoat B" Floor Enamel—For cement floors in basements and those laid directly on the ground where dampness might cause other enamel to peel off. Alkali-proof.

Covering Capacity—Will cover approximately 200 sq. ft. per gal., 2 coats.

"Sonotint," a Flat Washable Oil Paint for Interior Walls and Ceilings of Hospitals, Schools, etc.

A flat oil paint ready for use, which has all the softness and finish of water colors, with the advantage of being washable. It reflects the light without glare. Manufactured in 16 different shades. A color card will be sent on request. "Sonotint" forms a very hard elastic surface not affected by soap and water. Being very opaque, 2 coats cover perfectly and set without showing brush marks.

SONOTINT TRADE-MARK

Covering Capacity—Will cover approximately 250 sq. ft. per gal., 1 coat.

Stip-El-Art

A plastic oil base wall finish for stippling or texturing, easy and inexpensive to apply.

Stip-El-Art offers the painter and decorator the widest range for executing individual textured colorful effects. Ready for use, requires no thinning or mixing.

It is adapted for any style of building, domestic, commercial or civic. Solves the most complex decorative problems.

Covering Capacity—Will cover 60 to 100 sq. ft. per gal., 1 coat.

Further Information

The following printed matter sent on request:

"Specification Data" portfolio arranged according to A. I. A. classification. Fits standard correspondence files, comprises floor treatments, dampproofing and waterproofing, painting.

Booklets: "The Preservation and Strengthening of Wood Floors—Lignophol"; "Cemcoat Reflects the most Light."

Samples treated with Lapidolith, Lignophol, Cemcoat, Hydrocide Colorless, Stip-El-Art.

INCORPORATED 1916

STRUCTURAL WATERPROOFING CO., INC.

Waterproofing and Dampproofing Contractors

285 Madison Avenue, NEW YORK, N. Y.

Our Organization and Service

A reliable organization engaged only in contract work for the protection from the elements of structures above and below grade. Preventative processes during construction or curative processes after completion.

More particularly our service includes:

Cement Waterproofing.
Dampproofing.
"Spandrel-Tite" Waterproofing (on Spandrel Beam).
Exterior Colorless Treatment.
Pointing of Masonry.
Cleaning of Masonry.
Spray Painting.
Special Concrete Work.

Personal Supervision

All contracts receive the personal supervision of the principals.

Materials

The materials used for waterproofing and dampproofing by this company are those as prepared and marketed by the leading manufacturers of waterproofings and technical paints. We have selected and use those products of the several manufacturers which by years of experience we find best suited to meet the respective demands of efficiency, wear and effectiveness.

Because of our ability to use, effectively and honestly, the products of these *manufacturers we enjoy their recommendation, wherever the sale of their products involves service.

*(Names on application).

Guarantees

The guarantees as made by this company are concise, meaningful and binding—depending upon the type of work and other determining conditions they run from two to five years. Once assumed, no attempt is ever made to dodge responsibility when the *client* believes it rests upon us.

Diagram

The drawing on the opposite page represents diagrammatically a section of a building with certain details enlarged. These details are made for those sections of a structure through which water finds ready entrance and are those which require especial attention at the hands of architects.

Recommendations and Suggested Specifications for Architects Use

Dampproofing—We feel that the subject of dampproofing of interior walls is ably handled on the pages of the manufacturers of such compounds. In general, we recommend—2 brush coats of a semi-mastic dampproofing on tile block walls and one trowel coat of mastic on all brick walls.

"Spandrel-Tite" Waterproofing—As pioneers in the introduction and development of spandrel beam waterproofing—the "Spandrel-Tite Method"—we recommend the following:

(1) All beams in exterior walls back of brick veneer (and back of terra cotta and limestone where architectural details permit) shall be waterproofed by the "Spandrel-Tite Method" as installed and guaranteed by the STRUCTURAL WATERPROOFING CO., INC.

(2) The waterproofing membrane shall consist of one ply of Structural Waterproofing Co.'s "Mastikloth" (a cotton fabric super saturated with asphalt). All joints shall be lapped 2 in. and well sealed. The membrane shall start within 1 in. of the outside face of the wall on the top of the lintel or the course below the soffit of the spandrel beam, run up on the flange filling to the top of the beam, inwardly to the inside face of the wall and later turned up at least 3 in. on inside face of wall. Flash fully around all columns for a height of 6 in.

Waterproofed Cement Plaster Coat Process—For this method of waterproofing we would recommend the following:

(1) ***Intent***—It is the intention of these specifications to provide for the waterproofing of all specified surfaces below grade which are in contact with earth or rock. In general, this shall be accomplished by means of the Waterproofed Cement Plaster Coat Process as installed and guaranteed by the STRUCTURAL WATERPROOFING CO., 285 Madison Avenue, New York, N. Y. The following detailed specifications shall be used as a guide and whatever additions or exceptions are, in the opinion of the contractor, required to render watertight the areas specified, are included even though not specifically mentioned.

(2) ***Areas to be Covered and Scope of Work***—

Note: Insert under this heading the areas to be covered, such as, all walls, floors, walls and floors of all pits, trenches; height to which it is to be carried on the walls and columns, etc. In general a complete description of the surfaces to be covered.

The waterproofing shall run under all non-bearing interior partitions, and shall be carried up on the faces of all interior bearing walls to a height of ..... ft.

The contractor shall see that the area immediately under and 2 ft. on all sides and 6 ft. in front of the boiler (or boilers) shall be depressed for a depth of 6 in. to allow for the installation of a sand cushion and fire brick by others to protect the waterproofing from the heat of the boiler.

(3) ***Materials***—The cement waterproofing shall consist of a plaster coat of one (1) part cement, two (2) parts sand and the mixture of a waterproofing medium with the gauging water.

The waterproofing compounds shall be applied in the quantities and in the manner as specified by the manufacturer, and the contractor shall have the choice of using such material in which he has confidence and which he will guarantee, also that will result in a color and finish that will meet the approval of the architect.

The floor work shall be 1 in. thick and applied in one coat over as large an area as is practical at one time.

The vertical work shall be applied in two coats—scratch and finish—totaling not more than ¾ in. in thickness.

All work shall be floated and trowelled to a hard, dense and uniform surface and shall be left as a suitable finish as well as a waterproofing medium.

(4) ***Application***—All concrete surfaces, to receive waterproofing, shall first be thoroughly chipped, wire brushed and washed with a dilute acid water, and then with a clear water to present a new, fresh and clean surface to which the waterproofing will bond.

All brick surfaces, to receive waterproofing, will have had all joints raked out by the Mason Contractor to provide proper bond.

Note: The raking out of the joints in all brick work to be waterproofed should be included in the Specification for Mason Work.

(5) ***Precautions***—The contractor shall take all precautions to insure proper waterproofing around all pipes passing through the walls; to bond carefully one day's work to another; to relieve all water pressure during the course of the work by bleed pipes or pumping as may be required; to examine the site, ascertain the water pressure and to assure himself before starting the work that there is sufficient concrete and reinforcing in the floor slab and walls to withstand the contemplated water pressure.

(6) ***Guarantee***—The contractor shall, on completion of his work, furnish a written guarantee to the effect that no water or dampness shall penetrate through the areas waterproofed by him for a period of three (3) years from date of completion, and that if such leaks should occur he will promptly, upon notification from the owner, architect or general contractor, repair such leaks without cost.

KONSET
REG. U.S. PAT. OFFICE

Description and Uses of Products

Konset, an Integral Cement Mixing Compound—When mixed with concrete, provides four desirable conditions:

(1) Accelerates the initial and final set and increases the early tensile strength.

(2) Gives greater plasticity and workability.

(3) Increases density, making it hard and waterproof.

(4) Increases freezing resistance.

Konset is also made in any color in paste form, which produces any desired color effect in cement mixtures, such as floors, walls, mortar joints, and it is also used for making cement, brick, tile and stucco.

By using Konset in colorless or colored form you save time, labor and money, and at the same time make a surface that is hard, waterproof, and dustproof. This product is a lasting benefit to architects, engineers, contractors and owners.

Cemset Quick Setting Compound—This solution will accelerate cement and freezeproof concrete at 15° above zero without the use of salamanders or other devices.

Kemi-kal Cement Surface Hardener—In liquid or crystal form. This chemical is for hardening and dustproofing cement floors, walks and roads after they are laid. It also is used for stucco and plaster.

Konseal—A colored liquid filler for hardening and dustproofing cement floors after they are laid; serviceable and ornamental. A sanitary treatment for cement and concrete surfaces. Made in all colors.

Kontite-Portland Cement Paint—A flat coating in dry powder form made from portland cement. It is mixed with water instead of oil, for stucco, brick, stone, plaster, wall board, and all interior and exterior surfaces; is fire-resisting, sanitary, odorless and weatherproof. Made in gray, blue, red, buff, brown, green, white and cement color; or any shade to match.

Rustcotine—A chemical compound in which petroleum products are used as a base vehicle to carry rust inhibitive chemicals which prevent rust and corrosion. Made in paste and semi-paste form, and does not harden like paint.

Sealcote—Surface colorless waterproofing for outside walls of brick, stucco, concrete, stone, etc. Prevents efflorescence. Protects against dampness and lengthens the life of the building.

Sulco Liquid Waterproofing—A liquid integral waterproofing for all mass concrete or any place that portland cement requires waterproofing.

Sulco Waterproofing Powder—For mixing with the dry cement before sand and water are added.

Sulco Waterproofing Paste—A heavy white paste which is added to the gauging water that is used for mixing the concrete.

Sulco Mortar and Stucco Colors—Sulco Mortar Colors possess the characteristics of durability and permanency as they will not fade. The colors run uniformly as to shade, due to the special process used in manufacturing. Sulco Paste Mortar Colors are the finest and strongest for tinting mortar, or cement; quick setting, dustproof, waterproof and freezeproof.

Sulco Oilproof Coating—A liquid coating for oilproofing all surfaces that come in contact with gasoline, kerosene, naphtha, crude oil and its by-products.

Wood-Seal—Preserves new or old wood floors, composition floors, cork, rubber and linoleum; prevents warping, wear, rotting, disintegration or splintering.

Sulco Wood Preserving Oil—A product of wood obtained from the tar produced from the distillation of hardwood—principally oak, hickory, beech, birch and maple. Protects wood from rotting, checking, swelling and shrinking. Experts are available for the solution of any waterproofing problem or other technical information.

Iron-Cote—A metallic hardener for concrete floors in factories, garages, loading platforms, piers, packing houses, etc. It is composed of finely ground iron and other materials; is incorporated in the topping of concrete floors, making them capable of standing the effect of heavy service and protecting them against dusting.

Bux-Skin—A liquid for preserving and rendering awnings, tents, tarpaulins, curtains, covers, fisherman's riggings, hatch covers, canvas and cotton duck goods proof against mildew and water.

Art-Cote—Plastic paint for obtaining rough plastered wall effects.

Sulco Niloak Tile—For Egyptian, Indian, or Aztec motifs.

Aztex—Chemical cement stains.

Sulco Slipproof Grains—An abrasive material in loose form for impregnating cement or composition floors or stair treads to prevent slipping.

Fibermix—For floors, roofs, partitions, plaster and stucco. Nailing concrete and fiber mix combined.

Sulco Glazing and Caulking Compound—For bedding, glazing and caulking skylights, conservatories, hothouses, sheet metal frames, window frames, wood sashes, roofs, walls, concrete copings, swimming pools, tile floors, seams in boats, etc.

Sulco Plaster Bond, Dampproofing and Stone Backing—A dampproof bonding paint, permanent and adhesive.

Sulco Wax Compound—For polishing and treating old and new cement and wood floors; gives a beautiful luster. Easy to clean and soft under foot.

Sulco Insulating Cement—For protecting against heat leakage in piping, furnaces, ovens, and wherever a dependable, plastic, fire-resistant insulating material is needed.

Sulco Iron Cement—For smoothing the surface of steel and iron castings and repairing blowholes and other defects, filling up spongy castings, covering up countersunk bolt heads, pipe joints, or all places where an iron or steel patch is required.

Deflect-O-Lite Aluminum Paint—Deflects the solar heat and keeps the surface cool, protecting it against corrosion. For coating steel storage tanks, water tanks, steel bridges, metal buildings, penstocks, boilers, smokestacks, gas holders and all metal surfaces, concrete, brick and plaster.

Other Sulco Products—We make a specialty of manufacturing railroad and industrial paints and varnishes on specifications; so in purchasing material of this kind you are buying high class products 100% pure, which include: inside white; flat wall paints; factory paints; shingle stains; roof coatings; roofing cements, etc.

R.I.W. REMEMBER IT'S WATERPROOF
Reg. U. S. Pat. Off.
TRADE-MARK

Damp-proofing

No. 232 "R.I.W." Damp-Resisting Paint—A black, elastic, full-bodied, tacky, damp-proofing and plasterbond paint for brush or spray application to the interior surfaces of exterior masonry walls to which hard wall plaster is to be directly applied. Prevents the penetration of dampness, and renders the inside of walls vermin-proof and stain-proof.

Not to be used on ceilings of any kind, nor must concrete or portland cement mortar be applied directly over it.

No. 110 "R.I.W." Damp-Resisting Paint—A black, alkali-proof and waterproof, elastic paint to protect limestone, marble, granite and other cut stone from the chemical action and discoloration due to alkali in cement, and to moisture. Also resistant to mild acids.

"R.I.W." Marine Cement*—A black, damp-proof, thick liquid paint for brush application to the exterior of foundation walls and footings; concrete floor slabs, and wood sleepers laid in concrete. Does not need to be heated.

"R.I.W." Liquid Konkerit (Patented)—Priming and finishing cement paints, ready for use, for damp-proofing, beautifying and overcoming the natural porosity of exposed stucco, concrete and masonry walls. In white and colors. Dries with a flat finish. For gloss finish apply "R.I.W." Flex-Sicco Ready Mixed Paint in any color.

"R.I.W." Toxloxpore*—A colorless, damp-proofing liquid, especially adapted for application to brick, concrete, stucco, limestone, and Bedford stone.

When applied to a perfectly dry surface it will prevent the development of efflorescence and the penetration of dampness.

Caulking and Pointing Compound

"R.I.W." Elastic Caulking Compound, furnished in steel gray and French Caenstone shades; other colors can be made to order. This compound is a waterproof, elastic, non-staining material for the pointing of terra cotta, stone joints, etc., and for caulking metal or wood doors, frames, etc.

Cement and Mortar Colors

"R.I.W." Cement and Mortar Colors—For the coloring of portland cement, stucco, etc. "R.I.W." Edinburgh mortar colors produce strong, permanent colored mortar joints. Furnished in both powder and pulp form. These cement and mortar colors are alkali-proof and furnished in a number of standard shades.

Waterproofing

"R.I.W." Toxement (Patented)—Made in powder (gray) or paste form for the integral waterproofing of all portland cement construction such as concrete foundations, floors, walls, bridges, piers, reservoirs, cement mortar and stucco.

"R.I.W." lubricates the concrete, increases flowability and workability with the minimum amount of water, assuring of a thorough and non-porous mix and eliminates necessity for extreme tamping and chuting.

"R.I.W." Tox-Mix Clear—A colorless liquid to be used integrally in portland cement mixtures, such as concrete, stucco, brick, mortar, etc. When this solution is used a great increase is obtained in the early tensile and compressive strength of portland cement mixtures and it renders the resulting concrete or cement mortar permanently hard and dense.

Concrete and Wood Floor Protective Coatings

"R.I.W." Cement Filler (Patented)—Designed primarily for use as a priming coat on dry concrete floors subjected to ordinary conditions of service. It penetrates the pores, neutralizes the lime inherent in concrete and hardens the surface.

The finishing coat should be "R.I.W." Cement Floor Enamel.

"R.I.W." Cement Floor Enamel (Patented)—For a finishing coat on concrete and wood floors not exposed to the elements. Prevents "cement dusting" and resists wear.

Furnished in high gloss finish.

"R.I.W." Toxbro, Wood Floor Preservative and Filler—A light straw colored material for application to wood floors or other wood surfaces, for binding the wood fibres together; it also prevents the grain of the wood from rising and insures a smooth surface, prevents slivering, splintering, cracking and checking.

"R.I.W." Flintox*—A chemical solution which reacts with the cement and precipitates zinc silicious materials in the pores of the concrete. Intended primarily as a surface hardener, but because of the reaction and precipitation referred to, the material may be said to function as a binder and dust preventive.

Steel Preservative Paints

"R.I.W." Tockolith (Patented)—A cement basic anti-corrosive paint, gray in color, used for priming iron, steel or other metal. A finishing coat must always be applied according to the character of the finished surface required and the nature of the service expected.

No. 1017-A "R.I.W."—An acid-proof, alkali-proof and waterproof china wood oil paint for application to steel or wood. Unaffected by the alkali in cement mortar and concrete.

Furnished in black, red, brown, dark green and other colors.

Nos. 110 and 112 "R.I.W." Damp-Resisting Paints—Waterproof paints which have wonderful resistance to the alkalis in cement mortar or concrete. Recommended for finishing coat on structural steel building frames, brine and condenser pipes, etc.

Furnished in black and maroon.

No. 137 "R.I.W."—A bright red paint recommended either for interior or exterior use over a priming coat of "R.I.W." Tockolith, but 2 coats may be used without a primer.

Used on steel structures exposed to the weather; roofs, gutters, gas holders, tanks, etc., and where acid fumes prevail.

No. 49 "R.I.W." Damp-Resisting Paint—A high grade, exterior exposure paint made in black or dark olive green, and usually applied over a priming coat of "R.I.W." Tockolith.

Withstands the action of locomotive gases, acids and other fumes to which railroad bridges and viaducts are subjected. Used on tanks, lined smokestacks, etc.

Enamels and Wall Coatings

"R.I.W." Hospital and Laboratory Enamel—A waterproof, white, hard usage enamel which resists the action of sulphuretted hydrogen, gases and fumes of acids and other chemicals. Used principally in hospitals, laboratories, bathrooms, kitchens, milk stations, engine rooms, etc.

"R.I.W." Plaster Primer—A liquid coating of semi-opaque character, made in white (can be tinted with color in oil), intended for direct application to clean plastered walls. It overcomes the alkalinity of unpainted plastered walls and obviates the necessity of using sizing materials: i.e., glue size, sealing varnish or similar preparations.

"R.I.W." Machinery and Pipe Enamel—This enamel is intended for use on dynamos, transformers, steam and electric stationary engines, compressors, mill and other machinery, guards, rails, etc., not exposed to the elements.

Specialties

Our Technical Service Dept. can be of assistance to our clients where special materials are required or where unusual conditions are to be contended with.

Correspondence and personal inquiry are invited on technical paint and damp-proofing and waterproofing problems.

Architectural Service

THE TRUSCON LABORATORIES manufacture a complete line of waterproofings and paint coatings formulated to meet each individual requirement. The representatives of THE TRUSCON LABORATORIES are technically trained men whose duty it is to assist architects, engineers and owners in the selection of the proper material to meet their protective and decorative problems, by making a complete study of the requirement and furnishing detailed recommendations as desired and without obligation.

Truscon Waterproofing Paste, Concentrated

Definition—An integral compound for producing thoroughly waterproof concrete or cement mortar. It is adapted to waterproofing concrete construction of various kinds—foundations, reservoirs, tunnels, dams, cisterns, etc. Also used for waterproofing old brick, concrete and stone structures through the agency of a cement plaster coat into which the waterproofing is introduced. Truscon Waterproofing Paste is also used for producing waterproof cement stucco and cement mortar.

How Used—Truscon Waterproofing Paste, Concentrated, is incorporated into concrete or cement mortar through the medium of the water used for tempering the mix. Being in paste form, it diffuses itself readily through the water, forming a milky mixture. This milky appearing mixture of paste and water is used for tempering concrete or cement in the place of clear water.

Advantages—(1) Water repellent; kills capillary absorption of moisture into concrete or cement plaster. Since "plugging the pores" of cement is physically impossible, the repellent feature of Truscon Waterproofing Paste is the most practical and scientific method of waterproofing.

(2) Colloidal; is concentrated colloid and hence adds to the normal colloidal content of cement mortar, thus increasing its resistance to weathering and wear.

(3) High concentration and freedom from useless filler—it is all waterproofing—contains no clay, lime or such material.

(4) In paste form—the form most easily mixable with wet concrete or cement mortar batches. This insures even distribution of the waterproofing.

(5) Inert—does not react chemically with cement; hence does not lower the strength of the concrete.

(6) Lubricates the mix by cutting the "skin strength" of water—producing a concrete which "chutes" easily to the forms, also a more dense and compact concrete. In the case of cement mortar or stucco, "lubrication" makes these materials of creamy consistency and much easier to apply. Avoids mottling of surface of cement stucco.

(7) Insoluble in water—hence can not be washed out of the concrete or affected by time or weathering. This is an important point because so many of the waterproofings on the market will dissolve in water.

Specifications for Waterproofing Mass Concrete

Estimate 7 lb. of Truscon Waterproofing Paste to the cubic yard of concrete. Applicable to concrete foundations, reservoirs, tunnels, cisterns, swimming pools, etc.

Method—Water tightness shall be secured by the addition of Truscon Waterproofing Paste, concentrated, to all water used to temper the dry mixture of cement and aggregate in the proportions, and mixed, as directed below.

Ingredients and Proportions for Concrete—The concrete composing the structure shall consist of 1 part of cement, 2 parts of sand and 4 parts of stone (1:2:4) properly graded in size from coarse to fine.

The waterproofing is added in the proportion of 1 volume of Truscon Waterproofing Paste to 36 volumes of water in the following manner:

Mixing—First, mix 7 gal. Truscon Waterproofing Paste with 5 gal. of water. Second, use 1 qt. of this paste and water mixture to each bag of cement, adding same to the dry cemented aggregate. Then temper with clear water as usual.

Placing—All concrete shall be placed in one continuous operation, each pouring being thoroughly spaded. In cases where joints are unavoidable, care shall be taken to clean and roughen the old surface, and have it thoroughly wet and slush coated immediately before placing additional concrete.

Specifications for Waterproof Cement Plaster Coat

Estimate 6 lb. of Truscon Waterproofing Paste to the 100 sq. ft. of ¾-in. plaster coat applied to the walls, and 16 lb. of paste to the 100 sq. ft. of 2-in. finish applied to the floor. Applicable to reservoirs, swimming pools, cisterns and similar forms of masonry construction, whether of brick, stone or concrete.

Method—Water-tightness shall be secured by plastering the interior surface of the structure with a continuous coating of portland cement mortar waterproofed with Truscon Waterproofing Paste, Concentrated.

Ingredients and Proportions for Waterproofed Plaster Coat—The mortar composing the plaster coat shall consist of 1 part of cement and 2 parts of clean sand (1:2), free from organic matter and uniformly graded.

Preparation—The waterproofed cement mortar shall be prepared by thoroughly tempering (to required consistency) a dry mixture of 1 part of cement to 2 parts of sand, with water to which Truscon Waterproofing Paste, Concentrated, has been added in the proportion of 1 part of paste to 18 parts of water, and thoroughly mixed as follows:

First, mix 1 gal. of Truscon Waterproofing Paste with 1 gal. of water. Second, use 2 qt. of this mixture to each bag of cement, adding same to the dry cement and sand. Then temper with clear water as usual.

Preparation of Surface to be Coated—Before plastering the waterproofed cement mortar on to the hardened concrete, brick or masonry, proper precautions should be taken to insure thorough bonding and keying of the plaster coat to the wall.

Application of Coating to Sides—Immediately after applying a slush coat, the waterproofed plaster shall be applied in 2 coats each ⅜ in. thick as per specifications of the manufacturer, the second coat being applied just before the first has reached its final set.

Application of Floor Coating—Floors shall be prepared and treated with equal care as the walls to insure proper bonding of the mortar, and finished with a waterproofed cement mortar to a thickness of 2 in. Special care must be exercised in joining the wall coating to the floor coating, so that there is a continuous waterproof coating over the entire surface.

Pressure—When moisture is seeping through the walls, proper drainage must be provided during the application and setting of the plaster coat, until such time as the plaster coat has set and is capable of resisting pressure of its own adhesive strength.

Continued on next page

Truscon Ferritex

Dampproof wash for cement or concrete surfaces.

A pulverized iron compound, made chemically active, that when used as a brush coat over concrete or porous masonry, plugs up the pores and acts as a dampproofing.

It is often desirable to specify Ferritex as a dampproofing for the interior of cellar walls or concrete tanks where a black dampproofing compound would not give service and a waterproof cement plaster coat is found too expensive. It is to be noted, however, that where a decided hydrostatic pressure is encountered Ferritex is not recommended. For such severe conditions, the only remedy is the use of Truscon Waterproofing Paste Concentrated applied in a plaster coat.

Specifications for Ferritex

All concrete shall be dampproofed by the application of (1 to 5) thorough brush coats of Truscon Ferritex, (a porous concrete requires a greater number of brush coats than a dense concrete,) as manufactured and recommended by The Truscon Laboratories, Detroit, Mich.

Condition of Surface—The surface shall be thoroughly cleaned of dirt, grease and foreign matter.

Application—Ferritex powder as received in the can from manufacturer, shall be mixed with water in the proportion of 4 lb. of Ferritex to the gallon of water and applied to the surface with a good, stiff, bristle brush. Allowing from 5 to 6 hours in between coats for drying. The mixture must be kept continually agitated during each application, to insure powder remaining in suspension in the water.

Truscon Stuccotex

Paint for wet concrete and masonry.

A hydraulic paint for uniforming concrete and masonry surfaces, or for decorating wet or damp stone, brick or concrete surfaces, such as swimming pools, retaining walls, etc., on which oil paints cannot be successfully used.

Stuccotex is a dry powder which is mixed with water to the right consistency and brushed on to the surface after that surface has been thoroughly saturated with water.

Stuccotex does not flake nor crumble.

Covering Capacity—125 sq. ft. per gal., 2 coats.

Specifications for Stuccotex

All wet surfaces shall be given 2 coats of Truscon Stuccotex, as manufactured by The Truscon Laboratories, Detroit, Mich.

Condition of Surface—Surfaces to be treated with Stuccotex shall be free of all loose particles, paint, cold water paint, size, oil, grease or any other foreign matter which would retard or prevent direct contact of Stuccotex with the surface.

Preparation—Mix Stuccotex thoroughly with water in the proportion of 10 lb. of dry powder with 2½ qt. of water. Mix only enough for immediate use. Any Stuccotex that has been mixed longer than two hours shall be thrown away.

Application—To the *water saturated* surface (not merely wet, but saturated) apply the first coat of Stuccotex, brushing same carefully into the pores. After the first coat has set about 12 hours, thoroughly saturate surface and apply a second coat.

Caution: Keep Stuccotex surface wet—during very warm or dry weather, spray the surface for several days while painting. Keep Stuccotex container dry and tightly covered.

Truscon Plaster Bond

A black compound for dampproofing interiors of exposed masonry walls. Plaster Bond remains flexible and tacky, providing a permanent bond for a scratch coat of plaster troweled directly on to it, thus eliminating furring and lathing. Plaster Bond is not recommended for use on ceilings.

Covering Capacity—About 80 sq. ft. per gal., 1 coat.

Specifications for Plaster Bond

The inside surface of all exposed walls of the entire building shall be given 1 uniform application of Truscon Plaster Bond as manufactured by The Truscon Laboratories, Detroit, Mich.

The coating shall be perfectly continuous over the entire surface. In cases where the Plaster Bond cannot be run continuously back of the floor construction, it shall be applied back on the ceiling for at least 12 in. from the wall.

Special care shall be taken to coat all portions of the wall where there is any cutting out to permit the passage of pipes subsequent to the application of the Plaster Bond. All portions of the wall which are particularly absorbent shall be given a retouch coat, so that the entire area will have an even, uniform appearance.

The plaster shall not be applied until 24 hours after the wall has been coated with Truscon Plaster Bond.

Truscon Foundation Coat

A black coating furnished ready for use (no heating) for dampproofing masonry walls below grade. Apply with a large mop or brush. More economical and satisfactory than coal tar, or pitch.

Covering Capacity—80 sq. ft. per gal., 1 coat.

Specifications for Foundation Coat

General—The outside surface of all foundation walls shall be given 2 uniform applications of Truscon Foundation Coat as manufactured by The Truscon Laboratories, Detroit, Mich.

Condition of Surface—The surface shall be thoroughly dry and free from any adhering earth or foreign matter so as to insure the thorough penetration and bond of the Foundation Coat.

Application of First Coat—Truscon Foundation Coat shall be applied over the dry masonry surface with a large brush or mop, exercising special care to insure a uniform continuous coat. Allow 24 hours for drying time and apply second coat in one continuous application.

Truscon Foundation Coat shall be allowed to dry for at least 12 hours before being backfilled.

Truscon Temperite

Quick set and antifreeze for concrete and cement mortar.

Truscon Temperite is a chemical compound for accelerating and regulating the set of cement mortars, giving protection against frost, and bringing the cement to its point of final strength and hardness in a much shorter time. It also helps retain moisture and thus assists in hydration and lubrication of the mass, giving a denser concrete.

Truscon Temperite is furnished in liquid, or dry concentrated form.

Specifications for Using Temperite

Truscon Temperite, manufactured by The Truscon Laboratories, Detroit, Mich., shall be used in concrete or cement mortar as directed below:

If Temperite Liquid—Thin in the proportion of 1 gal. liquid to 10 gal. water. Use this mixture of Temperite and water in place of clear water for gauging the mixture of cement and aggregate.

If Temperite Dry Concentrated—Throw 2 lb. of Temperite Dry Concentrated into the mixer for every bag of cement, turning the mixer over a sufficient number of times to insure a thorough solution and distribution of Temperite.

Truscon Super-Por-Seal Transparent Dampproofing

A transparent coating for protecting and dampproofing exterior masonry walls above grade. May be applied by brush or spray. Super-Por-Seal is also suitable for use on unexposed sides of cut stone to prevent penetration of moisture and resulting discoloration.

Covering Capacity—80 sq. ft. per gal., 2 coats.

Truscon StoneTex Concrete Paint

The nationally known lime-resistant masonry coating for protecting and dampproofing exterior brick, stone, stucco or concrete. Furnished in white and 10 standard shades. Applied with a brush or spray. Prevents cold and moisture from filtering through masonry walls and avoids disintegration of concrete. Renovates and beautifies masonry buildings.

Covering Capacity—About 100 sq. ft. to gal., 2 coats.

Truscon Floor Hardeners

Metallic—Truscon Floor Hardener is a metallic hardener designed for giving floors in factories, warehouses and such places greater resistance to wear. Forms a dense, hard finish. Especially applicable to new cement floors, or to floors which need resurfacing.

Quantity required: 30 lb. to each 100 sq. ft.

Chemical Dry—Agatex Crystals, a chemical hardener for cement floors, furnished in dry form. Dissolved in water and applied with a brush or broom.

Quantity required: about 1 lb. to each 40 sq. ft.

Chemical Liquid—Agatex Liquid, a chemical hardener furnished in highly concentrated form for stopping dusting and crumbling of cement floors. Applied with a brush, broom or similarly convenient instrument.

Quantity required: about 1 gal. to each 100 sq. ft.

Specifications

For complete specifications on Truscon waterproofings and dampproofings, ask for a copy of "Truscon Architects' Specifications Book 'A.'"

THE VORTEX MANUFACTURING CO.

The Par-Lock Key for Surfaces to Be Plastered

1978 West 77th Street

CLEVELAND, OHIO

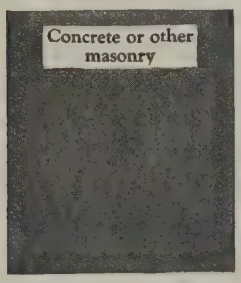
Processes

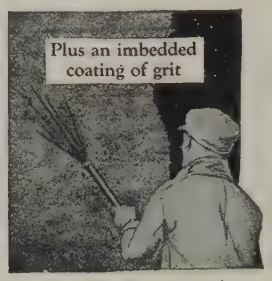
The Par-Lock Process is a widely used and approved method of preparing masonry surfaces for plastering by means of coarse grit embedded in asphalt. Par-Lock may be considered either as the dampproofing that affords an efficient mechanical key or as the Plaster Key that includes a superior job of dampproofing.

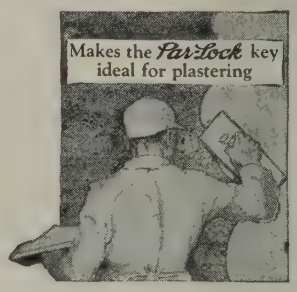
Par-Lock PLASTER KEY Registered U. S. Pat. Off.

Specification "I"—For dampproofing walls to be furred, and for coating cinder fill mixtures under matched flooring.

Collaborate with Nearest Par-Lock Applier—Specifications including any of these uses of Par-Lock should be prepared in collaboration with the nearest Par-Lock Applier in order that best results may be achieved for the particular work intended.







The Par-Lock Plaster Key may be applied to brick, tile or concrete wall surfaces, concrete slabs or clay tile and concrete joist ceilings, and all other interior concrete surfaces receiving plaster direct.

Specification

The inside face of all exterior masonry wall surfaces, all ceiling slab surfaces and all other concrete surfaces within the building, receiving plaster finish direct, are to be prepared, before plastering thereon, with Par-Lock Specification Form B as applied by the Par-Lock Appliers of—(insert name of nearest Par-Lock Applier from list on this page).

Other Par-Lock Specifications

Specification "D"—For dampproofing surfaces to be finished with portland cement or tile and bonding the portland cement or tile finish to structural bodies.

Laboratories, basements, swimming pools, tunnels, etc.

Specification "E"—"Cotton Membrane Waterproofing." For heavy waterproofing on basement walls, floors, footings, swimming pools, tanks, etc.

Specification "F"—For light waterproofing of footings, outside walls below grade line, basement floors, tunnels, etc.

Specification "G"—"Membrane Waterproofing." For heavy waterproofing to resist hydrostatic pressure. Tunnels, swimming pools, reservoirs, and deep basements.

Par-Lock Appliers

Behind Par-Lock is a national organization of expert, responsible applying firms. Par-Lock is a service, not a mere material. For lasting satisfaction rely on the Par-Lock Applier and rely on Par-Lock.

THE WATER LOCK CO.

Manufacturers of Admixture for Waterproofing, Hardening, Accelerating and Improving Workability of Concrete

20 East Front Street, CINCINNATI, OHIO

Products

CAMPBELL'S WATER LOCK CEMENT COMPOUND, a powder admixture that makes concrete waterproof and harder, and improves the workability—used strictly as integral.

SAHARA, concentrated form of Water Lock, for plastercoating—will staunch leaks and seepage, and eliminate dampness.

Form

Prepared in powder form, 100 lb. to the sack. Water Lock and Sahara mix right with the cement. No stirring or special treatment necessary.

Features

(1) Contains no acids or chlorides to corrode reinforcing steel or cause faces of walls to crumble or peel.

(2) Gives a buoyancy to the concrete, which keeps the heavy aggregate equally distributed throughout.

(3) Pours evenly and smoothly, requiring no pounding or scraping of mixers, barrows or chutes, thereby effecting a considerable saving in labor.

(4) Gives an early strength to concrete, reduces perviousness of concrete under 3 per cent.

Waterproofer

Whether Water Lock is used as an integral in new construction work, or Sahara as a plastercoat on a completed structure, an absolutely dry job is assured. At Wright Flying Field, Fairfield, Ohio, the Government keeps a constant supply of this material on hand to overcome seepage problems. It is the only waterproofing *tried* which has been found successful there.

Stucco

Water Lock, when used as an integral in the base of stucco, removes the danger of cracking and deterioration, by making it absolutely waterproof and hard.

Accelerator

On a 26-hour test at Purdue University, Water Lock concrete showed a compressive strength of more than two times as great as ordinary concrete. In addition, quoting the Purdue report, "Water Lock concrete showed less voids in the broken test specimens."

Workability

Water Lock improves the workability of concrete. Purdue University, Lafayette, Ind., known internationally for its engineering college, reported after making exhaustive tests that for mass concrete Water Lock possesses these merits:

(1) Improves workability, thereby

(2) requires less water to give workable concrete and consequently yields greater strength, and

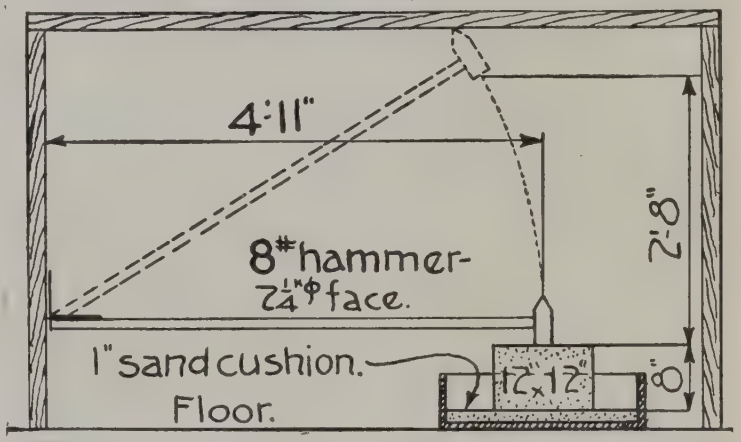
(3) makes the concrete more dense.

Fountain Building, Cincinnati, Ohio
HARRY HAKE, Architect
A typical Water Lock job

Hardener

The following official Government test bears witness to the hardening and workability qualities of Water Lock:

RECORD OF ABRASION TESTS, U. S. ENGINEER OFFICE CENTRAL DIVISION, JULY 19, 1928



No. blows	200		250		300		350		400		450	
	D	V	D	V	D	V	D	V	D	V	D	V
Plain Concrete												
Average	1 1/32	3.7	2 1/32	6.4	2 1/32	9.5						
Water Lock Concrete												
Average	9/32	2.0	27/64	3.1	1/2	4.2						

Notes: D Penetration of hammer, in in.
V Volume of pit made by hammer, in cu. ins.

Eight blocks of concrete, each 12x12x8 in., were made—four of plain concrete and four containing Water Lock. The composition of each plain concrete block was as follows:

Gravel	60 lb.
Sand	30 lb.
Cement	12.5 lb.

The other blocks contained 7.5 lb. of Water Lock and the sand was reduced in weight an equivalent amount.

As each block is 1/40 cu. yd., it is apparent that the mixture corresponds to 5 bags of cement per cu. yd., and that the Water Lock blocks contained 300 lb. of this compound per cu. yd. After the blocks were poured they were set out of doors to cure under natural weather conditions for 28 days following June 22. The method of making the tests and the results obtained are indicated above.

In general the Water Lock blocks showed only about half as much disintegration for a given number of blows as the plain blocks. The results are quite uniform and consistent.

The Water Lock also serves the same purpose as hydrated lime, or diatomaceous silica, which is generally added to concrete used in lock and dam construction to improve workability.

Specifications and Cost

The amount of Water Lock to be used depends upon the purpose, whether as waterproofer, hardener, for workability, etc., or all of them. A specification card is available either at our home office or any building supply dealer handling Water Lock. The cost of Water Lock in a job figures less than 40¢ per cu. yd.

Concrete Must Be Thoroughly Waterproofed to Insure Dryness and Permanence

Concrete's inherent porosity is its outstanding drawback. No matter how carefully are its proportioning, mixing and placing controlled, concrete always contains an appreciable percentage of "voids." This porosity is responsible for two serious defects: leakage and disintegration.

In basements, tunnels, pits and other structures below grade the danger of leakage with the resultant damage to goods, machinery, etc., is always present. Waterproofing all walls and floors below grade is effective and inexpensive protection against underground water and dampness and permanent insurance against bursting water mains and other accidents resulting in the presence of unusual water.

Absorption of water with alternate wetting and drying, as well as temperature changes, cause expansion and contraction which result in minute cracks. As these minute cracks develop, absorption increases, soluble elements in the concrete are affected, reinforcing steel is corroded, frost action starts, disintegration definitely sets in, the structure is weakened and complete failure is not impossible. Damp concrete exposed to frost, chips off due to the disruptive force of water freezing. Unfortunately, the first stages are deep seated and seldom noticeable until the damage becomes serious.

Disintegration may be repaired, the concrete restored and further disintegration forestalled. Disintegration of concrete may be prevented by proper treatment immediately upon completion.

The WESTERN WATERPROOFING COMPANY'S experience in waterproofing and dampproofing masonry structures and in restoring disintegrated concrete has proven that each problem must be treated as a separate study. This company believes that best results can only be guaranteed if the work is done by experienced workmen under expert supervision. It therefore offers its services as waterproofing and dampproofing engineers and contractors, under a strict guarantee of complete satisfaction. It sells no materials.

Western Waterproofing Methods

Leakage may be permanently prevented in new structures and cured in existing buildings by waterproofing with materials and methods developed and perfected by the WESTERN WATERPROOFING COMPANY. They have waterproofed all walls, floor slabs, etc., in thousands of structures throughout the country and their work has stood the test of time.

Each problem requires varied and individual treatment but, as a basic material, IRONITE gives the most satisfactory and lasting results. IRONITE is finely pulverized iron combined with chemicals. Applied with water the iron swells and completely seals the pores of the concrete. Advantage is taken of the very defect it is sought to cure—porosity and its accompanying suction. Other materials are used when required.

Prevention of disintegration is primarily a problem in waterproofing.

The application of IRONITE is repeated until the pores are completely and permanently waterproof, dampproof and proof against disintegration. The bond between the waterproofing and the structure is so perfect that it will resist *any* hydrostatic pressure the structure is capable of withstanding.

Specifications

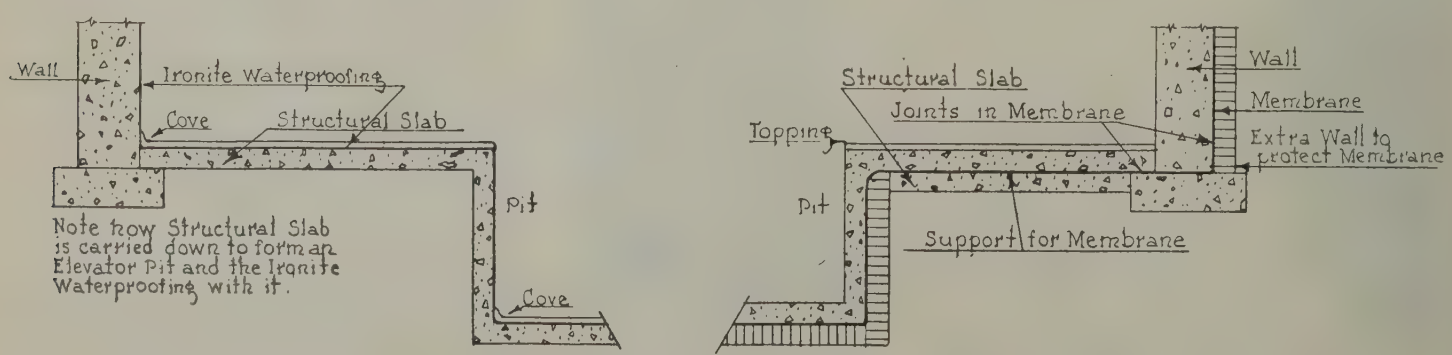
It is our preference to write a separate specification for each specific job. As a general specification the following may be used:

All surfaces to be waterproofed, comprising in general the interior surfaces of all walls and floor slabs in contact with earth, all pits, trenches and other depressions, all columns and interior division walls which penetrate the floor, together with such surfaces as may be hereinafter mentioned or indicated upon the drawings, shall be waterproofed by the WESTERN WATERPROOFING COMPANY (address of nearest office), and fully guaranteed by them, for a test period of two years. Walls shall be left with a brush [float] [steel troweled] finish. Cement floor finish over floor waterproofing is to be provided by this [mason] contractor. Necessary pumping shall be provided by the general [foundation] contractor.

Reminders

The following points are essential to a completely satisfactory waterproofing job. They are given here merely as reminders.

Have you provided continuous, accessible interior waterproofing?



Comparison Showing Saving in Construction

Continued on next page

Park Square Building, Boston, Mass.
Densmore & Leclear, Architects.

National Press Club, Washington, D. C.
Rapp & Rapp, Architects

Basements of above buildings waterproofed by Western Waterproofing Company

Are your walls and floors reinforced against water pressure?

Are your basement floor slabs keyed into the walls?

Are your boiler pits and flues insulated against excessive heat? (Should be included in the masonry or boiler specifications.)

Have you insured against unusual conditions in the adjoining areas—a broken water main—a clogged sewer?

Have you specified that the waterproofing be completed before interior partitions, machinery, or other obstructions are placed?

Are specially designed expansion joints required?

Are watertight construction joints provided?

The Resto-crete System for the Repair of Disintegrated Concrete

This system consists of cutting out all defective concrete, waterproofing with Ironite, which provides a perfect bond, building up to the original surface, again waterproofing with Ironite, and, where necessary, adding a final coating to match the original surface. By this system concrete can be completely restored to its normal condition and appearance. The illustrations of a Packard Building, recently restored by our Resto-crete System, show disintegration that can take place without being suspected. In this building there were practically no surface indications of the underlying damage. Restored by the Resto-crete system, this building is as good as ever, and disintegration has been permanently stopped.

Resto-crete results are absolutely guaranteed.

Other Work

Western Waterproofing Company is also prepared to undertake and guarantee the results of the following:

Waterproofing—Swimming pools, reservoirs, dams, retaining walls, etc.

Prevention of Absorption—In fuel oil tanks, gasoline and light oil tanks, molasses tanks, pickling vats, unusual oil containers, etc.

Protection—Of floors and walls of packing houses, soap factories, tanneries, dairies, etc., against the action of soaps, greases, fats, tannery liquids, dairy acids, etc.

Western Waterproofing Company's Services

We maintain in all parts of the United States, experienced waterproofing and Resto-crete crews, each under the supervision of expert engineers. Work can therefore be undertaken anywhere expeditiously and at a minimum cost. Our offices will be glad to assist in solving any of the problems relating to waterproofing, dampproofing, or the prevention or restoration of concrete disintegration. In requesting advice by mail, please give fullest possible particulars.

Product and Services

Manufacturers of "Cow Bay" Waterproof Cement.

Engineers and Contractors for Waterproofing, making a specialty of Cement Waterproofing. We contract for the waterproofing of basements, subways, reservoirs, vaults, tunnels, swimming pools, etc., guaranteeing a positive and permanent waterproofing of all kinds of masonry construction.

Designers and builders of Reinforced Concrete Construction.

THE WATERPROOFING CO. ESTABLISHED 1909 NEW YORK BOSTON COW BAY WATERPROOF CEMENT

TRADE-MARK
Reg. U. S. Patent Office

Experience

The Waterproofing Company introduced and perfected cement waterproofing. During the past 24 years this company has successfully completed thousands of difficult contracts in every section of North America, and have gone as far afield as Japan.

Advantages of "Cow Bay" Cement Waterproofing

No extra supporting walls required. Walls are left with a neat finish; no furring and plastering being necessary. Floor coating serves both as waterproof seal and floor finish. "Cow Bay" waterproof coating is as hard as the best portland cement finish; placed beneath grillages and column bases without danger of settlement.

Difficult Waterproofing Job Successfully Handled

The foundations of the Federal Reserve bank building, the deepest in New York, presented a most difficult waterproofing problem. These foundations were successfully waterproofed by us.

"Cow Bay" Waterproofing Specifications

Material—All interior surfaces of all exterior walls and upper surface of concrete floor slab throughout basement (or subbasement), elevator pits, machinery foundations, trenches, etc., as shown on plans, shall be waterproofed with "Cow Bay" Waterproof Cement, applied by The Waterproof Company.

Workmanship—All surfaces, before application of waterproof coating, shall be thoroughly chipped and cleaned, and coating applied not later than 24 hours after surface has been so prepared. A perfect bond must be secured with underlying masonry. Wall waterproofing shall be ⅝-in. thickness, applied in two coats. The floor work shall be 1 in. in thickness and is to serve as a wearing surface as well as a waterproof coating. All waterproofing shall be floated and troweled to a smooth and even finish free from imperfections.

Guarantee—The Waterproofing Company shall furnish written guarantee that all coating placed by them will be waterproof; that during a period of 2 years after completion of the work, they will promptly repair any leaks appearing through their waterproofing which are not due to causes beyond the waterproofer's control.

Service

The word service to us has always meant more than a mere word. Giving each individual problem the most complete attention in all its details has been our goal. For that reason T. W. C. Products have enjoyed the utmost confidence of those with whom they have come in contact. We sincerely invite inquiries from architects, engineers, and contractors and assure you of our genuine co-operation.

Whytex Liquid Chemical Concrete Floor Hardener (Applied Over the Surface)

When concrete sets the excess water evaporates leaving innumerable microscopic pores throughout the mass. This decreases the density, therefore the strength of the concrete. The surface of the concrete floor rests on these voids and when subjected to the abrasion of traffic and wear readily disintegrates causing the floor to sand, dust and wear.

WHYTEX TRADE MARK

Whytex fills these voids with an insoluble silicate and converts concrete into a solid mass. It is a positive and permanent concrete floor preservative against traffic, oils, greases, alkalis and acids and will entirely eliminate dusting, sanding and wearing.

Specifications—All finished concrete floors, stair treads, landings, etc., shall be completely treated with Whytex as manufactured by THE WHITE COMPANY, Baltimore Md., in strict accordance with their directions.

Hydrotex Integral Concrete Waterproofing and Hardener

Hydrotex serves a double purpose when added to any mixture containing portland cement, as it is a most efficient waterproofing as well as a permanent hardener. Portland cement in itself, when the set is perfect, is waterproof and as hard as granite. Hydrotex does not add any foreign elements to the concrete but acts as a catalyzer in the setting up of concrete and assures a perfect and complete crystallization of the cement. Hydrotex offers a superior method of waterproofing mass concrete, stucco, brick mortar, waterproof coatings and hardening concrete floors.

HYDROTEX TRADE MARK

Specifications—All the following concrete constructions (mention work to be waterproofed or hardened) shall be treated with Hydrotex as manufactured by THE WHITE COMPANY, Baltimore, Md., in strict accordance with their directions.

Whytol Wood Floor Preservative

Used to prevent wear, dry-rot and disintegration of wood floors. Lumber seasoned by modern methods has a tendency to absorb a large volume of moisture which attracts an abundance of fungi, the bacteria that is the cause of decay of wood. However, so long as the pores of the wood are filled with natural gums fungi will not enter the wood and premature decay is prevented. Paraffin and lubricating oils, although they tend to retard the action of fungi, break down the minute cellular structure of the wood, hastening decay. Whytol is a liquid composition of resinous materials and gums chemically blended that adds years to the life of wood floors by penetrating into the cells of the wood and deposits a permanent seal against the action of traffic, dry-rot and disintegration. Whytol is made in both natural finish and imitation wood colors.

WHYTOL TRADE MARK

Specifications—All wood floors, stair treads, landings, etc., shall be treated with Whytol as manufactured by THE WHITE COMPANY, Baltimore, Md., in strict accordance with their directions.

Hydrolox Waterproofings and Dampproofings

If the same results could be obtained with concrete as that shown in laboratory tests no waterproofing would ever be necessary. But due to the impracticability of securing consistently uniform materials commercially, skilled labor on the job and assurance of absolute proportions, it is necessary to add some form of material that will overcome these disadvantages in order to produce waterproof concrete.

HYDROLOX TRADE MARK

Hydrolox Integral Waterproofing Paste or Powder—Offers a means by which water repulsive materials are incorporated into the concrete. These materials do not have the least injurious effects on the concrete, but concrete into which they have been added strengthens with age. The Hydrolox Integral method will thoroughly waterproof mass concrete, cement plaster, floor topping, stucco and brick mortar.

Specifications—All the following concrete constructions (mention work to be waterproofed) shall be waterproofed throughout with Hydrolox Integral Waterproofing Paste [Powder] as manufactured by THE WHITE COMPANY, Baltimore, Md., in strict accordance with their directions.

Hydrolox No. 230 Dampproofing Plaster Bond—Made for dampproofing the interior surfaces of exposed vertical walls to which plaster is to be applied. It acts as a perfect bond between brick and plaster and prevents dampness, staining and protects against vermin. By its use furring and lathing are eliminated.

Specifications—The interior surfaces of all outside walls wherever plaster is to be applied shall receive two coats of Hydrolox No. 230 as manufactured by THE WHITE COMPANY, Baltimore, Md., in strict accordance with their directions.

Hydrolox No. 267 Exterior Black Dampproofing—Prevents seepage and protects against vermin and decay when applied to foundations, masonry work, etc., below grade and wood flooring and sleepers laid over concrete. Hydrolox No. 267 produces an elastic, tough alkali and acid resisting coating, bonds tightly to the surface and yields readily to contraction and expansion.

Under severe conditions, Hydrolox No. 267 should be reinforced with a layer of felt or open burlap. To prevent absorption through capillary action Hydrolox No. 267 should be applied over the footing and underbeds of a concrete floor.

Specifications—All surfaces (mention work) shall be given two heavy coats of Hydrolox No. 267 as manufactured by THE WHITE COMPANY, Baltimore, Md., in strict accordance with their directions.

Hydrolox No. 279 Colorless Exterior Dampproofing—Is a transparent liquid that is applied with brush or spray apparatus to dampproof outside surfaces of exterior walls of concrete, stucco, terra cotta, brick, light colored stone above grade. Hydrolox No. 279 is not a wax finish, but is a chemically blended compound of the most water resisting materials known to science. It enters the pores of the surface and deposits a permanent elastic seal against the elements and prevents efflorescence on brickwork. Also made in attractive tints where a colored finish is desired.

Specifications—All outside surfaces of exterior walls above grade shall be treated with Hydrolox No. 279 as manufactured by THE WHITE COMPANY, Baltimore, Md., in strict accordance with their directions.

Whytecote Wall Coatings, Mill White, and Chemical Enamels

Whytecote coatings offer a scientific economical coating that retains its beauty, protective and light reflecting qualities month after month, year after year, because the specially treated oil and selective pigment of which it is composed produce a lustrous finish that is hard and elastic. Whytecote can be applied with equal satisfaction by brush or spraying machine and is made not only in white, but in many beautiful tints. Because of its exceptional opaqueness Whytecote will cover any surface with one coat less than is necessary when ordinary paints or enamels are used. For specific conditions, in order to assure maximum satisfactory service in such places as laundries, bottling plants, etc., specify Whytecote Water-Heat Resisting Enamel. In oven rooms of bakeries, laboratories, etc., or wherever a chemical condition exists, specify Whytecote Chemical Enamel.

WHYTECOTE TRADE MARK

Specifications—As the surface to be coated governs the method of application, we will be glad to send complete detailed specifications upon request.

T. W. C. Technical Paints

Are superior paints because each paint problem is handled by us along its own lines and we endeavor to see that only that paint which will give maximum service shall be used on the particular job for which it is intended.

We invite correspondence regarding any information along these lines and assure you that our laboratory is at your disposal for capable assistance.

Literature and Specifications

Due to the lack of space we do not attempt to give detailed specifications here, but will be glad to send a complete and thorough specification book upon request.

We maintain a staff that is well equipped to advise you in reference to paint and waterproofing problems.

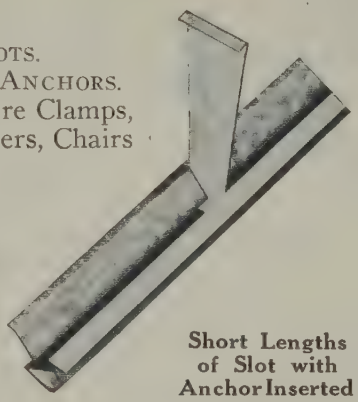
UNIVERSAL FORM CLAMP COMPANY

Manufacturers of Masonry Anchors and Slots, Continuous Sleeper Anchors and Other Construction Accessories

972 Montana Street, CHICAGO, ILL.

Products

MASONRY ANCHOR SLOTS.
CONTINUOUS SLEEPER ANCHORS.
Also Form Clamps, Wire Clamps, Tee and L Heads, Bar Spacers, Chairs and other construction accessories.



Short Lengths of Slot with Anchor Inserted

Masonry Anchors and Slots

Use—Universal Anchors and Slots offer a convenient method of tying brick, terra cotta, stone and tile to concrete, assuring strength and permanence.

Advantages—Safer, permanent, faster jobs are assured. The galvanized steel slot left in the concrete forms an internal part of the structure that can never work loose.

Anchors are inserted at any heights desired, and do not have to be bent and weakened to meet course heights.

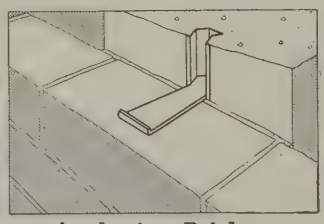
As the masonry is built up, anchors are placed at convenient heights, and a twist of the wrist puts the anchor in place.

Time as well as costs is saved, because measuring of course heights, boring of forms, and drilling of concrete are eliminated.

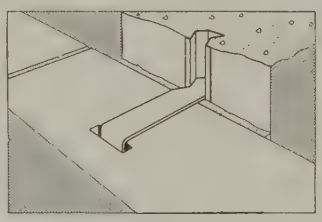
Installation—A length of slot is cut to fit the form, and the slot nailed to the form with the concave side down. The slot is left in the concrete when the forms are stripped, and the anchors inserted at convenient heights as the masonry is built up.

Universal form clamps are used to tie and hang forms for concrete under any conditions and are adaptable to any design of form for walls and columns. Accurate forms are insured and since spreading is absolutely prevented many extra yards of concrete are saved and cost of forms is reduced to a minimum.

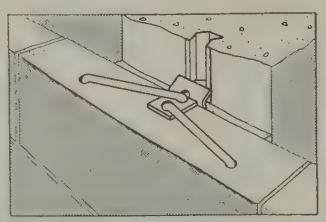
Information—In ordering specify whether brick, terra cotta, stone or tile is to be anchored. Furnished in 4-ft. lengths.



Anchoring Brick to Concrete
The anchor can be inserted at any height desired



Anchoring Stone to Concrete
A twist of the wrist puts the anchor in the slot at any course height

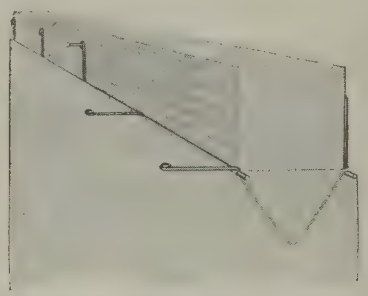


Anchoring Terra Cotta and Tile to Concrete
Two rods placed in holes in the anchor which may be inserted at any height hold the terra cotta or tile tightly to the concrete

Universal Continuous Sleeper Anchors

Use and Installation—Universal Continuous Sleeper Anchors fasten nailing strips to the top surface of concrete slabs. Inserted while the concrete is soft, they provide strong permanent anchorage for sleepers after the concrete is set.

Advantages—The continuous sleeper anchor gives five or six individual anchors with one operation. In little more than the time required to place a single anchor, five or six anchors are inserted, properly spaced.



Continuous Sleeper Anchors, Style "R"

Styles—Universal Sleeper Anchors are made in two styles:

Style "P" (parallel) lies parallel to the sleeper. The V-shaped anchors are of No. 10 wire and form an extremely strong anchorage. Two No. 12 gauge wires connect the anchors. When the concrete is set, the sleeper is placed along and on top of the anchor, and the wire arms with loops bent up and nailed to the sleeper.

Style "R" (right angle) Sleeper Anchors are placed at right angles to the sleeper. Its arms also lie flat and are bent up for nailing.

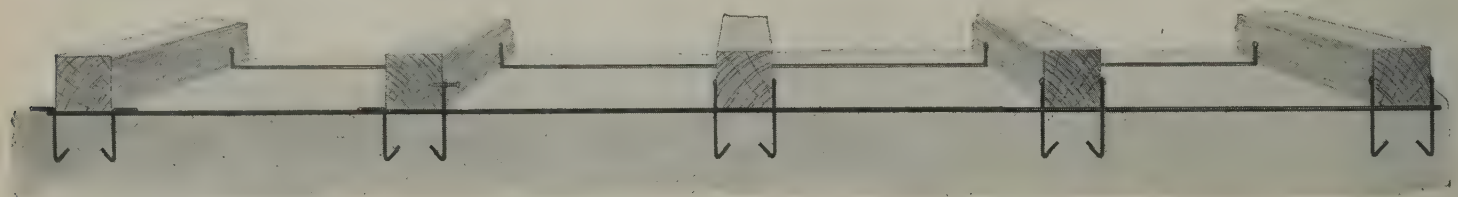
Information—Both Style "P" and Style "R" are carried in stock for 2-in. and 3¾-in. sleepers with anchors spaced 12 in. or 16 in. on center.

Style "P" comes in lengths of approximately 5 ft.; Style "R" in 4-ft. lengths.

Special lengths and spacings can be obtained in either type.

Below

Continuous Sleeper Anchors, Style "P"



WEDGIT TIE CO., INC.

Manufacturers of Positive Concrete Form Ties

95 Liberty Street, NEW YORK, N. Y.

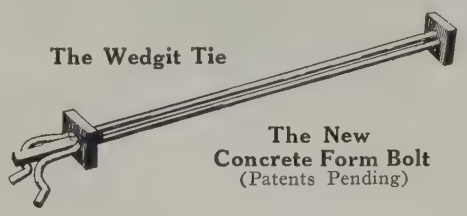
Wedgit Tied Forms Are Always Rigid

Wedgits are a new kind of bolts which automatically produce laboratory conditions in field forms, regardless of the skill of the labor. Each Wedgit is a bolt with two stems and a slotted nut and lock wedge. They are quickly fastened by means of a tightening tool (mule) that has a 30-to-1 pull. The lock wedge cannot be driven until the bolt is drawn rigid.

The stems of Wedgit bolts are unannealed, hard drawn Bessemer rods, with a tensile strength of 1950 to 2760 lb. per rod, which equals 3900 to 5500 lb. per Wedgit. Each rod has a conically upset shouldered bead which is pressed into the bolt head. The other parts are made of screw steel.

Some pouring conditions develop violent impacts on the forms, to overcome which Wedgit buffers (2¼x2¼x⅛ in. hard rolled steel) are used on both ends of the Wedgits—which effectually takes care of the recoil.

The Wedgit Tie



The New Concrete Form Bolt
(Patents Pending)

Rigid Forms Produce Exact Alignment and Better Concrete

Experienced architects, engineers and contractors know that it is the rigidity of laboratory molds that produces uniformly good concrete in the test laboratories, yet honeycomb specifications are quite general. The human equation causes form spread, which causes honeycomb.

That forms spread is shown by the use of short spreaders and the spreaders that drop out as the concrete rises, and also by the necessity of form bracing and face-of-form spading. The proof that there is no form spread when Wedgits are used is that the spreaders do not fall out as the concrete rises in the forms. No bracing is required except to hold the top in alignment and then only on one side. This positive concrete tie, by preventing form spread, prevents honeycomb. In 25,000 sq. ft. of surface, tied with Wedgits on the New York State Office Building, New York, N. Y., there was not a rough place as big as your hand—a broad statement but true.

When forms are rigid, the initial 30 minute set of concrete is not retarded. By catching this initial set Wedgits give *added protection against freezing.*

What Wedgits Will Do

Uses—Wedgits are used to tie irregularly shaped columns or walls, of any size, and battered walls, tie concrete to the back of stone ashlar, tie spandrel beams, belt courses, cornices, balcony risers, pipe trenches, lot line walls, underpinning, and close openings, and all without any bracing, and there are never any bulges. They are also used for hanging girder coverings and fireproofing.

Job Labor—Wedgits are one man ties, and workmen like them. They are true bolts; nevertheless, they are flexible. They work like bolts with a long thread on which the nut could be pushed to the tightening point, and then tightened with one turn of the wrench.

Money Saving—Direct payroll savings accrue when workmen like their tools, when work can be done several times as fast and a more satisfactory and better looking job produced. Results are the basis of our claim that Wedgits save 20¢ every time one is used.

Flexibility—Sometimes there are places where it is very difficult to pass a tie through forms in a straight line. Wedgits were successfully used on more than a mile of sea wall where the tie points on the opposite sides of the forms were as much as 6 in. out of line in both directions.

Satisfaction—Wedgits win quick approval through uniform results wherever they are used as is witnessed by our repeat order records. The progressive builder is quick to appreciate a device which is a step ahead, which saves time, materials, labor and money and does a better job.

Outstanding Advantages of Wedgit Ties

Wedgits are standardized and Wedgit tied forms are always 100% rigid. Wedgits prevent form spread and thus prevent honeycomb.

Spreaders are cut full thickness of walls when using Wedgits.

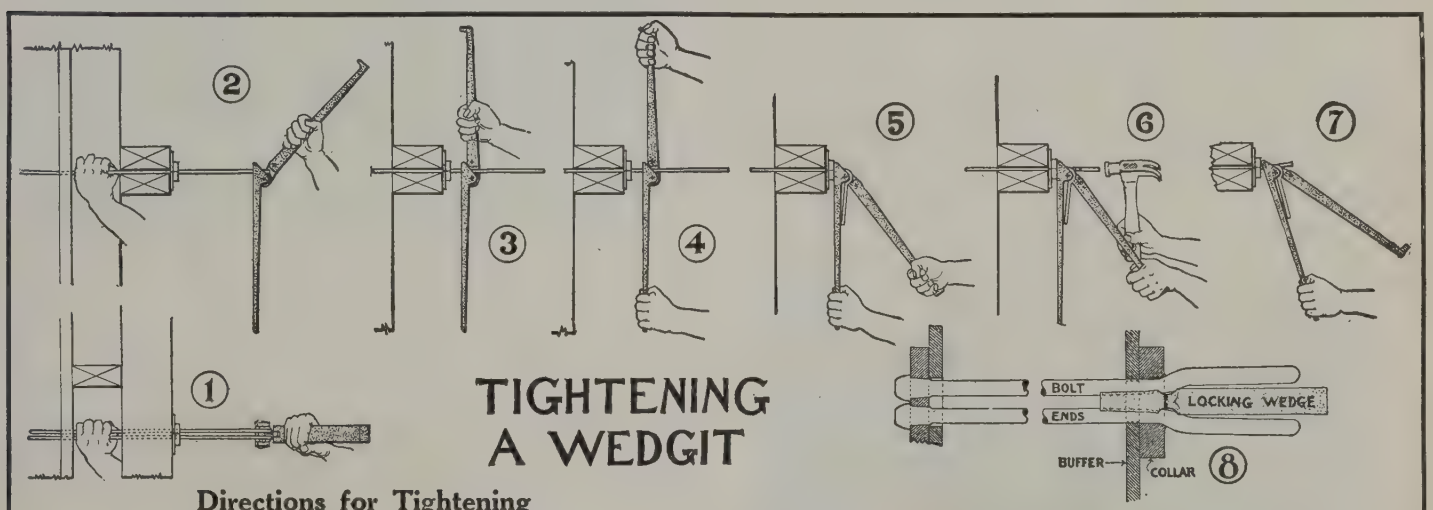
Wedgits never wear out because they are only used once.

They save twice their cost. The workmen like them.

No more labor to pull them than to leave them in; no seepage; no patches; no bulges.

Wedgits have other uses beside tying forms, viz.: tying freight.

Wedgits are flexible bolts.



Directions for Tightening

1 and 2—After placing the buffer and collar, grip the bolt back of the waler, then hold the mule as shown and push the link between the ends of the bolt while raising the handle to a vertical position, then slide the mule onto the bolt as shown in Fig. 3.

3—*Leave from ½ to ¾ in. between the collar and the back of the mule.*

4—Shows tightening grip—pull enough on the bottom handle to balance the throw over of the top handle.

5—If one pull is not enough lift the top handle and pull again, but the finish of the pull should leave the handle *far enough down so as to allow the free driving of the wedge.*

6—After placing the wedge put a good strain on the handle and drive the wedge.

7—To release the mule lift the bottom handle slightly, then lower it and swing it about ⅛ turn to one side and it will be free.

8—Sectional view of the locked Wedgit showing its construction. Don't break off or bend the locking wedges.

Note: To strip the forms, either cut the bolt back of the walers, or twist the heads off with a wrench.

To Pull Wedgits—All the way or part way, cut the bolts close to the backs of the walers and then proceed the same as when tightening. Always heel the mule on a piece of wood when pulling *Wedgits.*

A few *Wedgit* applications are shown at the right.

Products

BAKER REMOVABLE WOOD JOIST FORMS.

Also Reinforcing Steel Bars; Spiral Column Reinforcement; Bar Spacers; Electric Welded Fabric; Metal Lath; Cold Rolled Channels; Baker Shores (Adjustable).

Facilities and Service

An engineering organization, established in 1910, places eighteen years' experience in concrete design and forming at your disposal. A competent force of field engineers is backed by a large engineering department in our main office, to aid in solving your problems in design and forming.

Our bids include the complete forming (erection and removal) of the ribbed slab (concrete joist) construction, including slabs, joist sides, soffits, and shores, complete from beam to beam. The work handled by our men is indicated by the shaded portions of the details on the following page. If preferred, we also include column, beam, and miscellaneous forming in our bid.

A booklet with half-tones of a hundred structures of a wide range of types, erected with the aid of Baker Removable Wood Joist-Forms, will be sent upon request.

Special Features

Wide Range of Adaptability—Every condition, from light loads of hotels to heavy loads of special warehouse design, can be economically met—joist spacing, width and depth of joists, end conditions—all can be varied at will. These forms have been used in many:

Clubs	Garages	Factories
Hotels	Residences	Theaters
Apartments	Warehouses	Office buildings

Forming the Guaranty Building, Indianapolis, Ind.
Note the tonnage stored directly on our forms—possible only with a solid unyielding pan of wood

Eliminate Honeycombing—The design of our forms reduces leakage to a minimum, which practically eliminates honeycombing. The cost of wastage through most types of forming is considerable. Not only the cement and labor cost, but also pointing the resulting honeycombed joists, removing leakage from the floor below by chipping or scraping, etc., are items of real expense.

Solid Working Areas—The unyielding surface of these forms permits the trades to work without fear of crushing or displacing; shows a saving in the cost of placing steel, pouring conrcete, attaching inserts, etc. Being of wood, this forming allows easy placing of outlet boxes, sleeves, etc., with the assurance that they will be found where they were placed when the forms are stripped.

The Time Element—A specialized service *organized for speed* will work to your progress schedule. *We have yet to delay our first job.* We co-operate with and keep ahead of our customer's organization.

Low Cost—These advantages, together with patented features of our forming system, produce a lower cost than can probably be equalled by any other ribbed slab-forming materials, either of the permanent or removable type, where floors are reasonably typical. We do not show so large a percentage of saving where there is little duplication in the forming.

Hollywood Beach Hotel, Hollywood, Fla.
Interior showing excellent results obtained in decorated exposed concrete joists

Exposed and Decorated Concrete Joists

The joists are left exposed in buildings of many kinds, but always for one of two purposes—to save the cost of ceiling construction or for the architectural effect. In either case, clean lines and smooth surfaces are essential to good appearance.

Wavy and irregular soffits or joist sides; projecting humps of concrete on the underside of joist or slabs; ridges, indicating where pans were lapped or butted; all such deformities are objectionable in factory or garage —they are positively impossible in hotels, theaters, apartments, and residences where the exposed joist is used for decorative effect.

Crooked joist lines are eliminated and smooth finished concrete soffits are easily available to the designer who uses Baker Removable Wood Joist Forms. One of our patents covers use of mouldings forming the poured concrete at angle of joist and underside of slab.

To Specify

The forms for the ribbed slabs shall be Baker Removable Wood Joist Forms. They shall be oiled with a light paraffin oil before being used. Before pouring concrete the forms shall be thoroughly wet down with water. Forms shall be so constructed that they can be removed without disturbing shoring.

Note: For more detailed information, call our nearest office. An engineer will respond promptly.

Berloy Steel Floor Cores

CANTON, OHIO

For Branches, see page A650

Products

BERLOY FLOOR CORES, FLOOR CORE END CAPS.

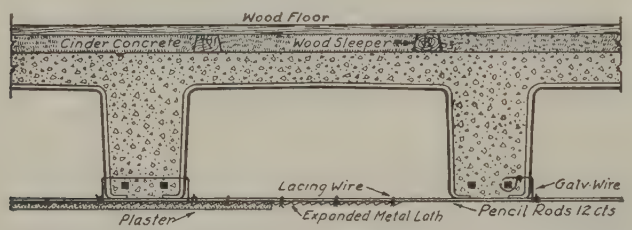
For Metal Ceilings, see pages A650-651; for Metal Building Material, see pages B1685-1689; for Lockers and Shelving, see pages C3798-3799.

Use and Design

Berloy floor cores are metal forms for the construction of continuous slab T-beam concrete floors in steel or concrete framed buildings. They are made in such wide range of styles, sizes and weights that the construction can be adapted to any detail of design. End caps are made for use with all sizes and styles of floor cores.

Permanent Floor Cores

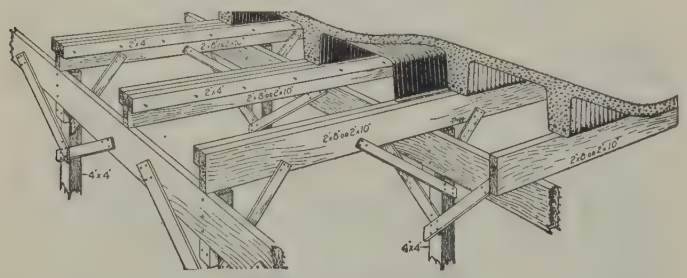
Berloy floor cores of the permanent type are usually made of No. 26 gauge metal and remain as a permanent part of the construction. Where this type is used, Berloy ⅜-in. Ribplex for the ceiling is first laid on the temporary shoring, and the forms on the Ribplex.



Attachment of Lath with Removable or Permanent Cores by Means of Wires Placed Before Concrete Is Poured

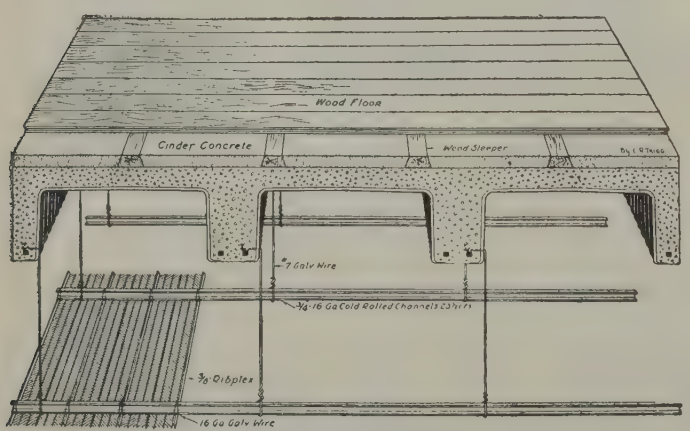
Removable Floor Cores

These are made of No. 22, 20 or 18 gauge material and can be removed and reused several times.



Method of Shoring

This method of shoring permits the removal of the cores for further use as soon as the concrete has taken its initial set

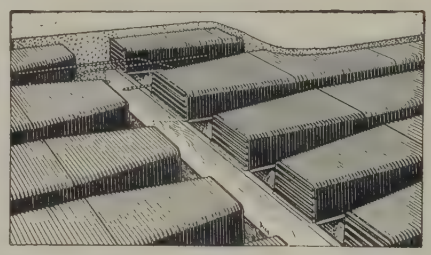


Suspended Ceilings

Details for either permanent or removable floor cores

Special Floor Cores

Concrete joists formed by floor core construction are normally designed to be from 4 to 6 in. wide. To meet special conditions of load and shear Berloy single and double taper floor cores are provided in both permanent and removable types. The special width floor cores also meet special requirements.

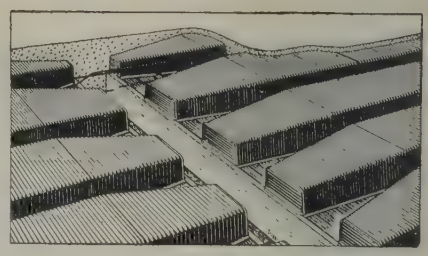


Single Taper Floor Cores

These taper down from the normal width of 20 to 16 in. This increases the width of the joist 4 in. where it enters the concrete beam.

Double Taper Floor Cores

These taper in width from 20 to 16 in. and also 2 in. in height providing an additional 2 in. of thickness of slab at the top where it enters the beam.



Narrow Width Floor Cores

To complete a floor width where standard 20-in. width floor cores are not an exact multiple, standard depth floor cores, either permanent or removable, are made in several narrower widths, with end caps to fit.

25-inch Floor Cores

Wider spacing between joists sometimes provides a more economical design than is offered by the standard 20-in. cores; for such cases special cores 25 in. wide can be supplied. These will produce joists 29 to 30½ in. on centers instead of the standard 24 and 25½ in. on centers.

Sizes, Styles, etc.

Width—20 in. between sides at bottom is standard, 25, 16 and 12 are special. Single and double taper cores are 20 in. wide at one end and 16 in. at the other.

Length—36 and 30-in. covering lengths are standard for Berloy floor cores. Tapered cores are made only in 36-in. length.

Depth—4, 6, 8, 10, 12, 14 and 16 in. are standard. Double tapered cores taper from standard height at one end to 2 in. lower at the other.

Gauge—No. 26 gauge steel is standard material for all permanent cores, Nos. 22, 20 and 18 gauge for removable cores.

Weight

The weights of the floor cores vary from 1¾ lb. per lin. ft. for permanent floor cores 4 in. high, to 6 lb. per lin. ft. for 14-in. removable floor cores. The floor cores are shipped nested, which simplifies shipping and storage problems.

Engineering Service

Berloy Engineers experienced in designing this type of construction are at the service of architects ready to assist with layouts, suggestions and estimates.

A new Core Handbook with complete information will be sent promptly on request.

THE BUILDING PRODUCTS COMPANY

Concrete Form Contractors

National Distributors for Blaw-Knox Removable Steel Forms

TOLEDO, OHIO

Products and Service

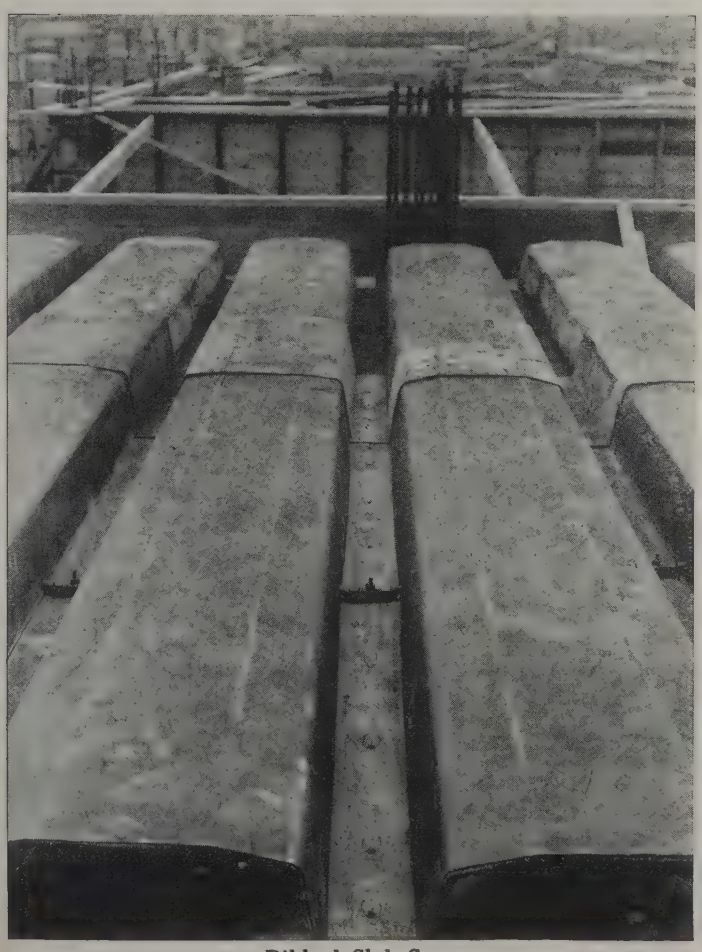
Removable Steel Forms for Ribbed Slab Concrete Floors; Removable Steel Forms for Flat Slab Concrete Floors; Steel Column Molds for Circular Concrete Columns; Heavy Gauge Steel Tile; and specially designed Steel Forms for any purpose that involves sufficient duplication.

A specialized Engineering Organization, competent to design and redesign structures involving the use of steel forms, co-operating completely with architects and contractors. Quotations will be furnished involving lease only, or entire work erected complete. An experienced and competent erection organization is available on short notice.

Ribbed Slab System

Used most economically in buildings requiring a light load such as hotels, apartments, office buildings, schools, etc. Steel soffits are used, insuring uniform width of joists, requiring a minimum quantity of lumber and a comparatively small erection force. Spreaders to support reinforcing bars in joists and hairpin hangers for fastening ceiling lath are provided. Forms are stripped promptly without disturbing shoring and each shore is super-imposed directly above shores underneath.

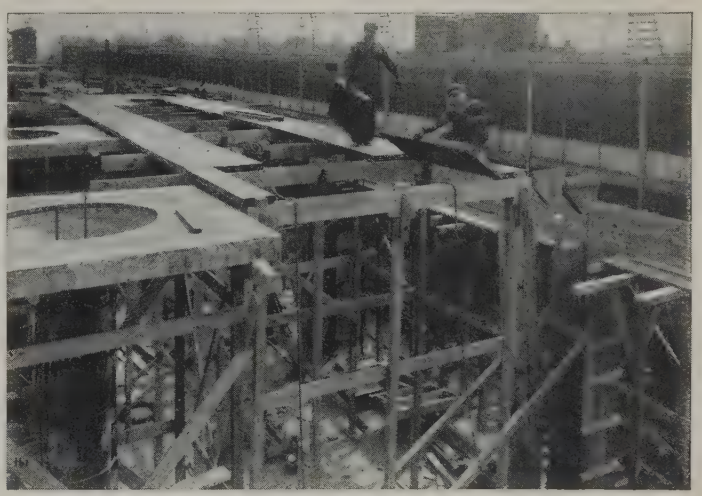
Pans are No. 14 gauge material; standard depths are 6, 8, 10 and 12 in. Joists are 5 in. wide, 25 in. center to center and adjustable for any span. Further details are described in our Ribbed Slab folder—sent free on request.



Ribbed Slab System

Flat Slab System

Used to advantage where a heavy floor load is involved, such as factories, warehouses, cold storage plants, etc. Steel panels are substituted for wood and a shoring system added which simplifies all operations; including erection, minimum quantity of lumber, constant repetition of similar operations, stripping without disturbing the shoring, super-imposing shores directly above those below, and employing unskilled labor. All these factors mean maximum safety and economy.



Flat Slab System

Steel panels are made of No. 14 gauge material properly reinforced. Wood forms shrink, warp and swell.

The same job can be done quicker, better and cheaper with Blaw-Knox Flat Slab Forms. Flat Slab folder sent on request.

Adjustable Circular Column Forms

Used most commonly with Flat Slab floor construction but also used without heads in beam and girder construction wherever a round column is desired. Adjustable in diameters of even inches and heads in multiples of 6 in. as shown on sketches; adjustable in height as sections telescope into each other. Available in two styles of heads. Column Mold folder, available on request, contains chart showing volume in column heads.

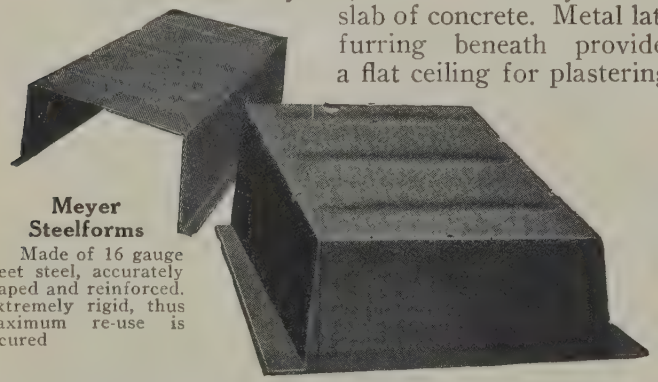
Reinforcing Bars

Ceco Reinforcing Bars

Rolled only from new billet steel. The deformations or lugs are placed at right angles to the axis of the bar, thus assuring maximum bonding value. Tested and approved by the Robert W. Hunt Company.

Description of Meyer Steelforms

Meyer Steelform Construction is a standard system that represents the highest type of concrete joist floor construction in present day use. It consists of rows of heavy gauge removable steel forms, separated by reinforced concrete joists, and covered by a thin slab of concrete. Metal lath furring beneath provides a flat ceiling for plastering.



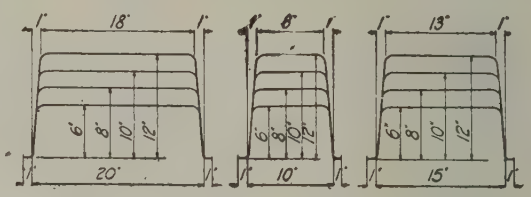
Meyer Steelforms
Made of 16 gauge sheet steel, accurately shaped and reinforced. Extremely rigid, thus maximum re-use is secured

Meyer Steelform Construction is most economical for buildings with lighter loads and longer spans, such as apartments and hotels, residences, schools, hospitals, office buildings, garages, light manufacturing buildings, etc. In this class of structure, dead weight of construction is a considerable factor in the total load, so that the saving in dead load effected by Meyer Steelform Construction affords a considerable saving in cost.

Meyer Steelforms are handled on a rental basis only. Ordinarily, the labor of installing and removing the steelforms by our skilled workmen is included with the rental charge. The economy in the re-use of Meyer Steelforms, on a rental basis, is readily apparent.

In building the formwork for the concrete joist floor, Meyer Steelforms are used as a mould for the joists and the intervening slabs; the load being carried by the joists in one direction to the supports. Continuous joists are produced by lapping the Intermediate Steelforms, and the ends of the rows of Intermediate Steelforms are closed with Endforms.

Meyer 20-in. Wide Flange Type Steelforms



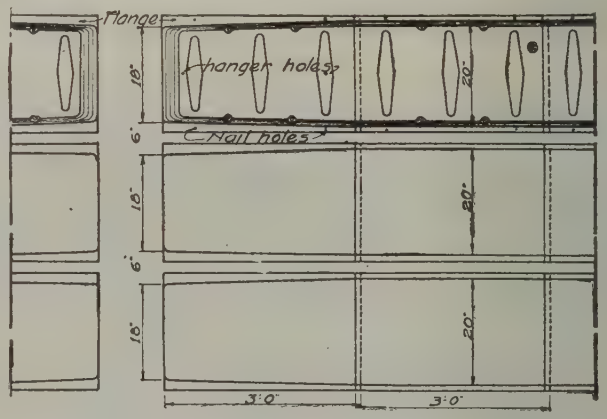
Standard Types Special Types

Meyer Standard Intermediate Steelforms furnished in 1, 2 and 3-ft. lengths. Meyer Special Intermediate Steelforms furnished only in 3-ft. lengths.

Meyer Straight Endforms furnished only in 1-ft. length, 10, 15 and 20 in. wide.

Single Tapered Endforms—Furnished in 3-ft. length. 6, 8, 10, 12 and 14 in. high and 20 in. wide at open end. Forms taper from 20-in. width at open end to 18-in. width at closed end. (See detail.)

Double Tapered Endforms—Furnished same sizes as single tapered except there is a reduction in depth of steelform of 3 in. from open end to closed end to form "T" on beam.



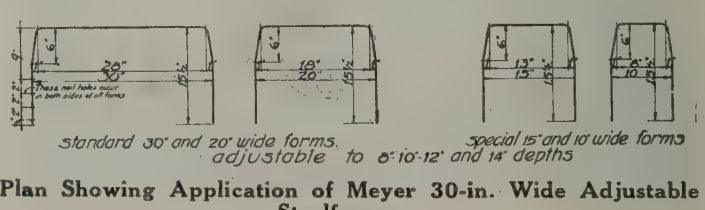
Plan Showing Application of Tapered Flange Type Endforms

Meyer 30-in. Wide Adjustable Type Steelforms

Meyer Adjustable Steelforms are made 30 in. wide and 16 in. in total height. There are no horizontal nailing flanges and the Steelforms are nailed to the sides of the wood joists, soffits instead of on top of same.

Of 14 gauge metal, and without stiffening impressions of any kind, Meyer Adjustable Steelforms are rendered absolutely unyielding and rigid by the use of small angles riveted to the underside of the form. Thus joists neat and cleancut in appearance and of uniform width are produced.

Meyer Adjustable Steelforms are particularly recommended for open ceiling work. The neat and cleancut appearance of the joists, their uniform width and alignment, the spacing of the joists at about 3 ft. on centers, are all pleasing to the eye and produce a workmanlike job.



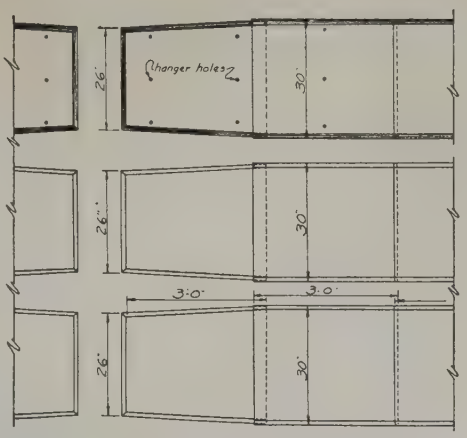
Plan Showing Application of Meyer 30-in. Wide Adjustable Steelforms

Continued on next page

Sizes of Meyer 30-in. Wide Adjustable Steelforms—

Standard Intermediates are furnished 30 in. wide and 1, 2 and 3-ft. lengths. Special intermediates are furnished 20, 15 and 10 in. wide.

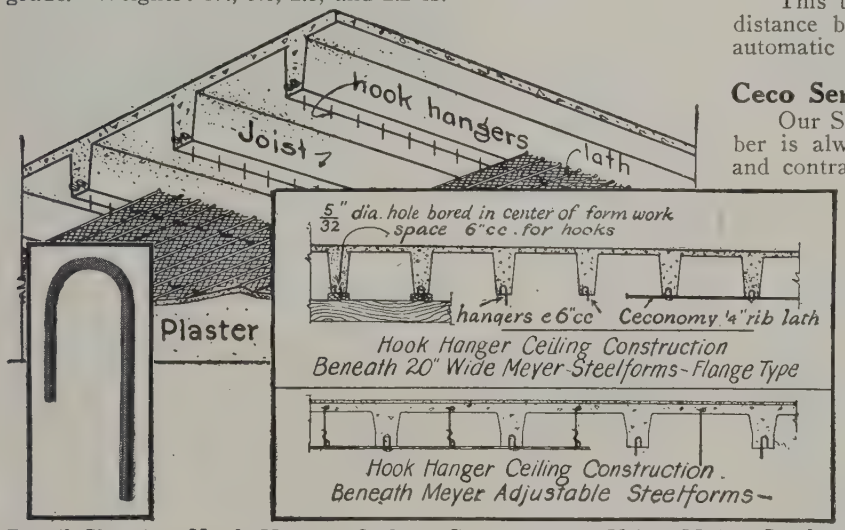
Straight Endforms are 1 ft. long. Tapered Endforms are 3 ft. long.



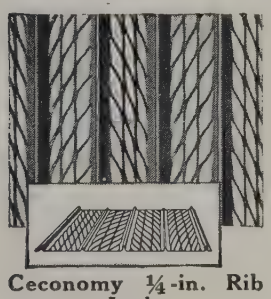
Plan Showing Application of 30-in. Wide Adjustable Steelforms

Ceco Metal Lath

Furnished in black iron, corrugated, galvanized, cut from galvanized sheets; also in copper iron alloy grade and in pure iron grade. Weights: 3.4, 3.0, 2.5, and 2.2 lb.



Detail Showing Hook Hanger Ceiling Construction, Using Meyer Steelforms, Ceconomy ¼-in. Rib Lath and Ceco Hook Hangers



Ceconomy ¼-in. Rib Lath

Ceconomy ¼-in. Rib Lath

This metal lath requires 20% less plaster than ordinary metal lath. It was designed as a result of the demand for a metal plastering base and a reinforcement; Ceconomy (1) prevents plaster cracks, (2) is fire resisting, (3) requires less plaster than other metal lath and (4) is absolutely rigid. Ribs ¼ in. deep spaced 1.2 in. on centers.

Ceco Hook Hanger Ceiling Construction

Hook hanger ceiling construction (above) involves the use of special Ceco Hook Hangers and a rib lath when used in connection with 20-in. wide Steelform Construction. When used in connection with 30-in. wide Steelform Construction the use of 10 gauge galvanized wire hangers and ¾-in. furring channels is also necessary to assure maximum rigidity. This construction provides a most economical lath ceiling, is strong and rigid, but must be brought up tight against the bottom of the joists. The elimination of channels, hangers, and pencil rods effects an economy in material and labor.

Ceco Hook Hangers are made of 10 gauge galvanized wire. Bent to form hook so as to give a 2-in. embedment in the concrete and a 1½-in. projection beneath the concrete. Parallel sides 1 in. apart.

Ceco ⅜-in. Rib Lath

Cut from open hearth steel; furnished painted. Also from pure iron or copper bearing steel. Ribs are ⅜ in. high and spaced 4 in. on centers. Erected with lath side out. No channels or rods necessary. Packed 9 sheets to bundle, nested and shipped uncrated.

Attached Ceilings

Our standard attached ceiling constructions used in connection with 20-in. wide and 30-in. wide Steelform Construction involve the use of galvanized wire hangers, steel furring channels, ¼-in. round steel pencil rods and metal lath.

Note: The use of ¼-in. Ceconomy Rib Lath spanning 24 in. on centers between the furring channels instead of the ¼-in. round pencil rods and flat lath is equally recommended.

This construction may be brought tight up against the bottom of the joists or suspended as much as 6 in. The ceiling is erected after the removal of the Steelforms, and can be leveled up, straight and true, despite any variation in the level of the floor construction without filling out with plaster afterwards. The concrete and plaster do not come in contact.

This type of ceiling construction may be dropped a short distance below the bottom of the joists in order to conceal automatic sprinkler pipes or other conduits.

Ceco Service

Our Sales Department is technically trained, and each member is always ready to assist consulting engineers, architects and contractors with layouts and estimates for the reinforced concrete portion of building work.

Shipping Facilities

Complete stocks of all our products are maintained at all our warehouses listed on the preceding page. Meyer Steelforms are available at these points only. Prompt attention given every order large or small.

Handbooks

Handbooks describing all our products and their uses will be mailed on request. Much valuable information is contained in our latest edition, write for it. Please address our Omaha office.

THE GOLDSMITH METAL LATH CO.

Manufacturers of the Shurebond Unit System of Metal Tile for Reinforced Concrete Slab Construction

GENERAL OFFICE AND FACTORY
CINCINNATI, OHIO

Products

THE SHUREBOND UNIT SYSTEM of METAL TILE.

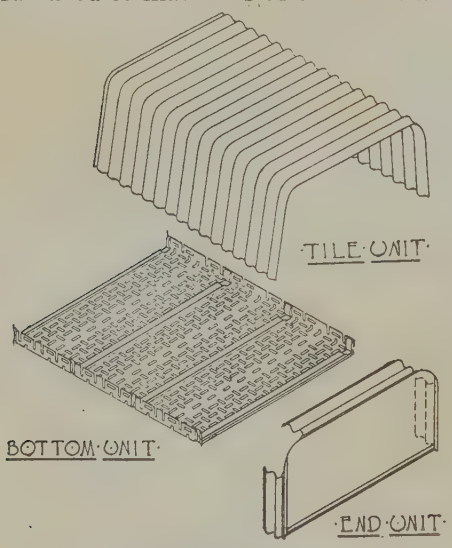
For Metal Lath, Inserts, Furring Channels, etc., see page B1696.

Services

Catalogues, specifications, dead loads, concrete quantities, instructions for placing and installing, and other information on request.

The Shurebond Unit System (Patented)

A system of concrete rib or joist construction, combining quality with economy of construction. Manufactured of materials of sufficient weight properly treated to produce not only lasting construction, but also sufficient strength to stand up without distortion while being installed and concreted. Particularly adapted to long spans. The type of slab construction to use for hotels, office and commercial buildings, loft buildings, school and institutional buildings, apartment buildings, garages, etc. A strictly reinforced concrete system that can be designed and figured.



Shurebond Tile, End and Lath Bottom Units

Shurebond bottom units are tacked to the forms.

Shurebond tile units are placed in lath bottom units—no nailing.

Shurebond end units wedge on tile units —no nailing

Advantages of the Shurebond Unit System

Less dead load to carry a given live load—saves reinforcing, concrete, and forming, reducing size of columns, girders and foundations.

Speed of construction—reduces contractor's overhead, carrying charges on the investment, and produces quicker revenue from the building.

Simplest type of forming necessary—open or skeleton forming.

Ease of erection—can be placed by one man, no stripping of metal pans, domes or forms, no wire hangers, no furring required.

Maximum strength and rigidity—special analysis heat treated steel used for tile units, eliminating sags and bends without planking while under construction.

Flat, level ceilings that are integral with the concrete—when stripping forms, can not pull down, thus eliminating refurring. Sufficient weight of lath bottom units to insure rigidity and long life. As easy to plaster as wood lath.

No nails to clip before plastering.

Perfect alignment — assuring concrete joists of uniform width throughout entire length, as tile can not shift or spread while concreting.

A hard dense concrete—no concrete leakage, absorption or honeycombing.

No breakage — less storage, hauling and handling.

Simplicity of conduit installation.

The American Furniture Mart, Chicago

The largest building in the world. Shurebond Patented Unit System used throughout—completed and ready for plastering at the rate of one floor per week

Savings Effected by the Shurebond Unit System

Maximum concrete displacement.
Reduced cost of wood forming.
Lower cost of installation.
Reduced cost of plastering.

Shurebond Unit System Sizes

Standard width 20 in. at base.

Standard length 2 ft. and 1 ft. covering surface.

Standard depth 4 to 16 in., inclusive, varying 1 in.

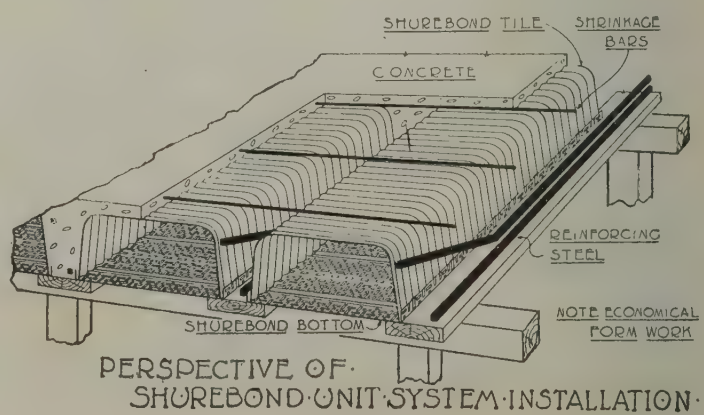
Beveled or tapered tile or both in 2-ft. lengths to any degree of bevel or taper within reasonable limits.

Flanged tile furnished where lath bottoms are not required.

Fill-in tile the same as above, but 12 in. wide at base.

Standard end units of sizes to fit various tile units.

While our standard width is 20 in., we make any width or depth of the Shurebond Unit System to meet any special proposition or any layout that an architect or engineer may consider economical.



PERSPECTIVE OF SHUREBOND UNIT SYSTEM INSTALLATION

GRID FLAT SLAB CORPORATION

1025 Massachusetts Avenue

BOSTON, MASS.

Grid System

New and economical flat slab form of construction for floors and roofs, made upon removable steel domes. This method is a two-way rib section of reinforced concrete acting to support a lighter floor slab. By cutting out all useless concrete between the ribs there is considerable concrete and reinforcing steel saved. This saving of concrete and steel cuts the dead weight very materially and permits for wider spans and column spacings—bays have been constructed up to 32 ft. square.

Calculations for Grid System—The calculations for the Grid Flat Slab are identical with those of the usual two-way flat slab. Standard specifications for concrete and reinforced concrete for flat slabs apply to Grid Flat Slabs.

These formulas are recommended for use where there are no definite building laws. Where architects or engineers design without set codes, the method taken with usual two-way flat slab designs can be taken with Grid Flat Slab.

Thickness of Slab and Depth of Dome to Be Used—The thickness of the Grid Slab and the depth of the dome required for any structure is determined by the weight to be carried and the span or spacing of the columns. The same method of determining the thickness of the ordinary flat slab should be employed. The rule is that the slab should be $\frac{1}{32}$ of the column span. The depth of the dome plus the thickness of the slab above should usually be at least 1 in. greater than the usual flat slab. The slab should never be less than 2 in. on top of the dome the depth depending on the concentrated load.

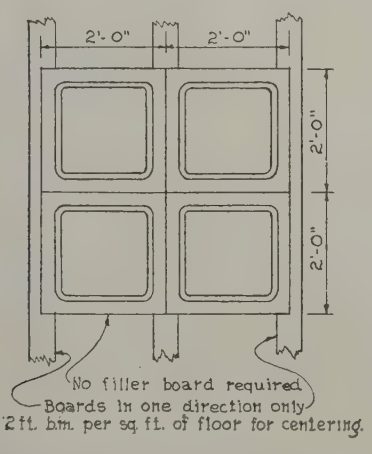
Steel Domes—The size of the removable steel domes is shown in the following illustration. Each 8-in. dome displaces 1½ cu. ft. of concrete.

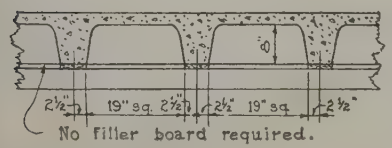
Wood Forms—The domes require support by narrow boards 2 ft. apart extending in *one direction only*. In the majority of designs the bottoms of the plinths are flush with the bottoms of the ribs, thus doing away with the expense and delay of forming dropped panels.

Placing Reinforcing Steel—*Reinforcing steel can not be misplaced or left out.* The steel is placed, one or two bars in the ribs and the steel man can not misplace it or leave it out, by mistake, without it being noticed.

Inserts and Electric Conduit—All inserts and conduits can be placed in the Grid Flat Slab the same as regular slab. Outlet boxes in ribs, large junction boxes in slab. Inserts can be placed as desired and held firmly in place with a small device. Floor drainers, if large, by leaving out a dome—extra concrete will support it.

Pouring of Concrete—The domes are No. 16 gauge steel. The tops are flat and stiff enough to support a runway to wheel concrete to point of placing. Screeds can be placed on domes to assure correct and equal thickness of concrete in placing.





Availability of Steel Domes—The steel domes for the Grid System are available in quantities large enough for any job and can be supplied on short notice.

Domes and System Patented—The steel domes for the Grid System as well as the type of construction are patented and patents owned by the GRID FLAT SLAB CORPORATION.

Service

The engineers of GRID FLAT SLAB CORPORATION will act as consulting engineers with architects and engineers on any Grid design and will furnish, place, oil and remove domes.

EDWARD A. TUCKER COMPANY

Contracting Engineers for Fireproof Floor Systems and Concrete Reinforcement; Removable Metal Forms

Converse Building, 101 Milk Street

BOSTON, MASS.

REPRESENTATIVES IN HARTFORD and NEW HAVEN, CONN., ALBANY and UTICA, N. Y.

Products

DIAMOND DEFORMED BARS; SPIRALS.

FLOOR SYSTEMS: Metal Rib Long Span, Akme Flat Slab, Combination Tile.

Also, Marks System Gypsum Roof, Metal Frame Stirrup Units, Clips, Spacers, Chairs, Removable Metal Forms.

Services

This company offers, in connection with the sale of its floor systems, complete structural designs and plans; and the fact that the company is regularly retained as engineers by architects and contractors is a guarantee that the designs offered in the sales propositions will be conservative and reliable.

We lease our metal forms either with or without engineering services or sale of reinforcing material. Complete information showing application to any particular building furnished on request.

Reinforcement

Diamond bars—standard deformed bars rolled for us by the Jones & Laughlin Steel Corp., from new billet stock to standard specifications for reinforcing bars.

Shipments

Direct from the mill.

Mill Warehouse—from the most modern and completely equipped fabricating plant in the United States.

Boston Stock—warehouse at East Cambridge fully equipped with power machines for fabrication of all kinds, large stock, shipments at one day's notice.

Metal Rib Floors

Consist of reinforced concrete joists and slab, formed by removable metal pans or domes. This system reduces the waste of form material to the lowest point, saves on the amount of concrete and reinforcement, and is adapted to all classes of work. For garages, manufacturing plants and unfinished buildings, open joist construction is used. For schoolhouses, hospitals, etc., a metal lath ceiling is attached to the ribs, giving a level ceiling. Note this feature—lath is put up after all concrete work is done, thus avoiding the wavy ceiling effect, the rusting and breaking of lath through long exposure and the uncertainty of the quality of concrete obtained.

We supply forms in 31 and 20-in. widths.

For exposed ceilings, the 31-in. forms increase the diffusion of light and give a much more pleasing ceiling effect than the 20-in. spacing.

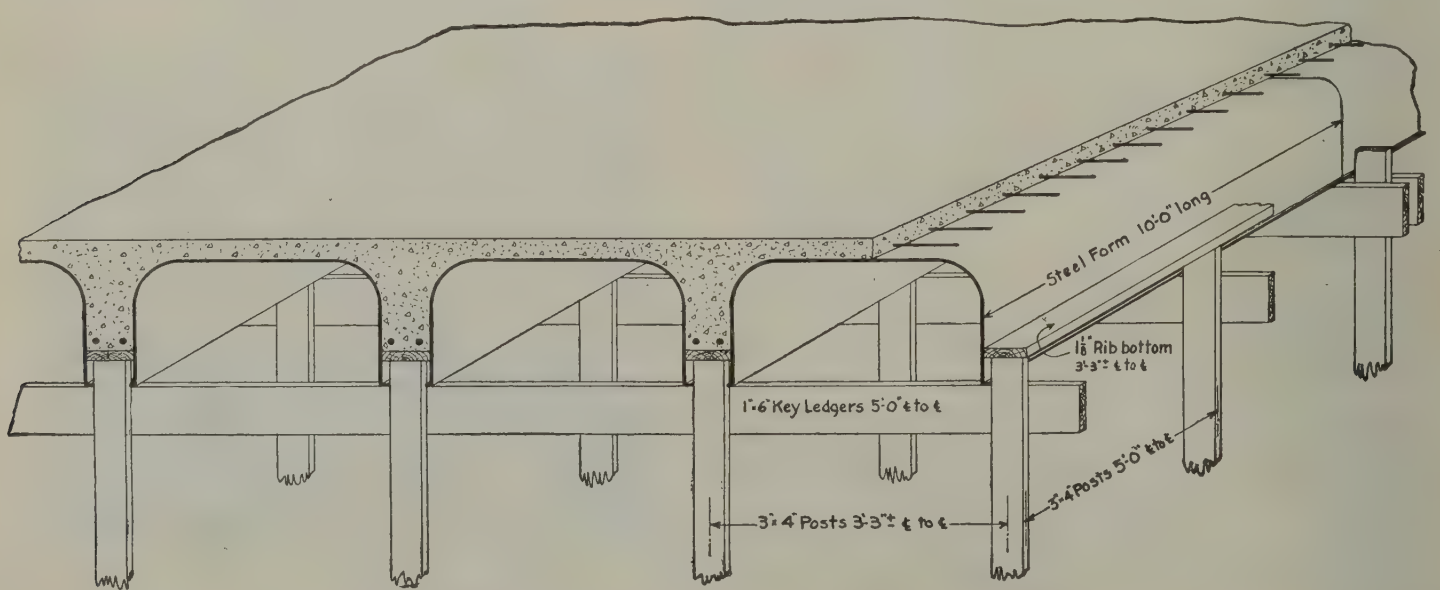
Metal forms are of No. 12 gauge (⅛ in. thick) and because of this thickness a form as rigid as wood centering is provided, giving also true alignment of the ribs. The standard lengths of 6, 8 and 10 ft., will support the loads with shores only at the ends, thus reducing requirements for shores to one for every 25 to 30 sq. ft.

The long lengths also mean few laps, reducing to one-third this labor item if joints are specified to be smoothed up.

Lumber for false work in Metal Rib construction, including waste, is reduced to one and one-quarter board feet per square foot, or a saving of three-quarters to one board feet as compared with usual pan systems; the number of pieces in the lumber for false work is one-half that of other systems.

The quality of the work and the speed and economy of the construction depend on using a heavy gauge form.

Architects are requested to refer to us in specifications to provide definitely for bids on Metal Rib System.



Metal Rib Floor Construction Showing Slab and Forms in Position

REPUBLIC FIREPROOFING COMPANY, INC.

Slagblok Fireproof Floor Construction

31 Union Square, NEW YORK, N. Y.
REPRESENTATIVES IN PRINCIPAL CITIES

Products

REPUBLIC SLAGBLOK FLOOR SYSTEM, consisting of Slagblok Units and Steel Bar Reinforcement for stone concrete fireproof floor construction.

Experience

We have furnished the material and service for the floor construction of more than one thousand buildings.

Engineering Service

Our engineers will appreciate the opportunity to co-operate with architects and consulting engineers as to the design and application of the Slagblok System. Estimates of cost gladly furnished. Working drawings for construction furnished with sale of Slagblok and reinforcement.

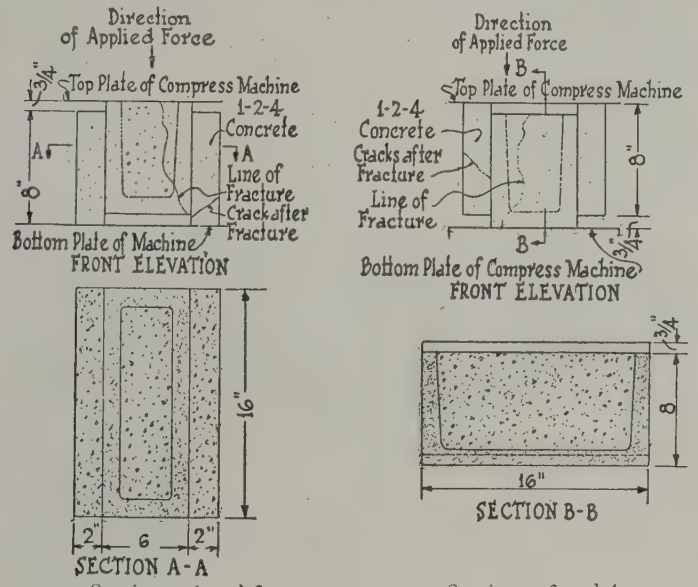
Slagblok System

The Republic Slagblok Floor System is designed according to established engineering practice. It is a system of floor construction using strength-increasing void-producing Slagblok units. It provides a soundproof fireproof floor having the maximum strength with the minimum dead weight and depth. Every element going into the Slagblok floors is of structural value, therefore the design is inherently economical.

Slagblok Units—These units are made of slag concrete in our shops under a special process by patented machinery and treated to have high compressive and bonding value. Every possible precaution is taken to insure an absolutely even and dependable product.

The unit is not a mere void producer; it is a properly designed compression unit, bonding perfectly with ribs and beams of material for which it has absolute affinity. It is legitimately used for stress in construction.

A bond test made by Haller Testing Laboratories proved perfect results as follows:



Specimens 1 and 2 Specimens 3 and 4

Methods of Testing

Republic Slagblok Bond Test

Test made by The Haller Testing Laboratories, Plainfield, N. J. Specimen 6 in. Republic Slagblok and poured 1:2:4 concrete. Age: Slagblok 28 days, concrete 14 days. Date of test: September 15, 1927

Identification	Specimen No. 1	Specimen No. 2	Specimen No. 3	Specimen No. 4
Bond area.....sq. in.	229.0	229.0	229.0	229.0
Maximum test load....lb.	78.500	57.500	86.000	62.000
Strength....lb. per sq. in.	*342.8	*251.0	*375.5	*270.7

*Note that the figures do not indicate the maximum bond stresses between the Slagblok and the poured concrete sides, but represent the existing bond stresses at the time when the specimens failed. As will be noted from the sketches, no cleavage whatsoever took place between the Slagblok and the poured concrete even for these extraordinarily high bond stresses.

On account of failure of the specimens in the poured concrete (see line of fracture in sketches) caused by combined moment and shear stresses, the maximum bond stresses could not be determined from these tests.

Structural Features—Slagblok construction saves structural steel or reinforced concrete framing. It offers the minimum depth of floor—resulting in reduced story heights or increased ceiling heights. It is recommended for any usual flat slab span.

Slagblok floor construction provides an equal section for compression to resist both positive and negative moments.

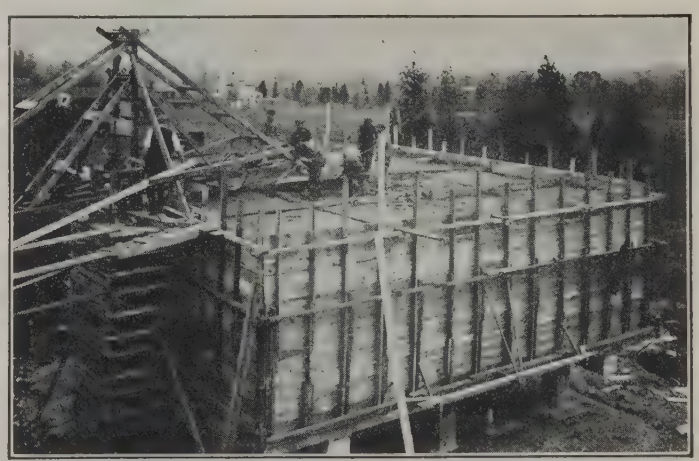
Slagblok units are completely closed when in place, preventing concrete entering the voids. Consequently, a minimum of concrete is used in construction and the dead weight of the Slagblok slabs is fixed irrespective of the consistency of the concrete poured into the ribs.

Slagblok ceilings do not warp or spring and plaster has a solid masonry base for application. They are also practically uniform in texture and color so that the plaster after application is even in color and highly satisfactory for decoration.

There is no metal to rust and disintegrate with Slagblok floors.

Load Deflection Test—This test was made by Columbia University Testing Laboratories, New York (illustrations below). The results were exceptional. The test panel was subjected to a maximum load corresponding to a uniformly distributed load of 840 lb. per sq. ft. at which load shear failure was produced adjacent to the supporting girders. Complete official report gladly sent on request.

Showing Arrangement of Slagblok and Reinforcement Before Pouring Concrete



The Test Panel Supporting a Load Corresponding to Approximately 800 Lb. per Sq. Ft.

Republic Slagblok Floor Test

Panel 31 ft. square over all, 22 ft. square inside of supporting girders. Slagblok units 8x16x16—20 in. on centers with 4-in. reinforced concrete ribs in two directions. No concrete top. Total test load 840 lb. per sq. ft. at failure

Approval—Slagblok construction has been approved by the building departments of New York, N. Y. (all boroughs); Washington, D. C.; Boston, Mass.; Hartford, New Haven and Bridgeport, Conn.; Albany, Syracuse and Rochester, N. Y.; Newark, N. J., and many others.

Product

Schuster Hollow Tile Floors.

Description

Schuster hollow tile floor construction is a combination of hollow tile and concrete reinforced in two directions.

The tile are 12x12 special design clay blocks, capable of resisting shearing and compressive stresses. They are an integral part of the slab and are held securely in position by the key of concrete which is forced into the cells.

Each concrete joist between the rows of tile in each direction is reinforced with a straight bar, resisting positive moment; and, where continuity exists, with a short straight bar over the support, resisting negative moment.

No temperature bars are required. No concrete is required on top of the tile.

Structural Feature and Economy

Small dead loads permit the use of small beams, columns and footings. This effects a saving in concrete and reinforcement in these members as compared with other types of construction.

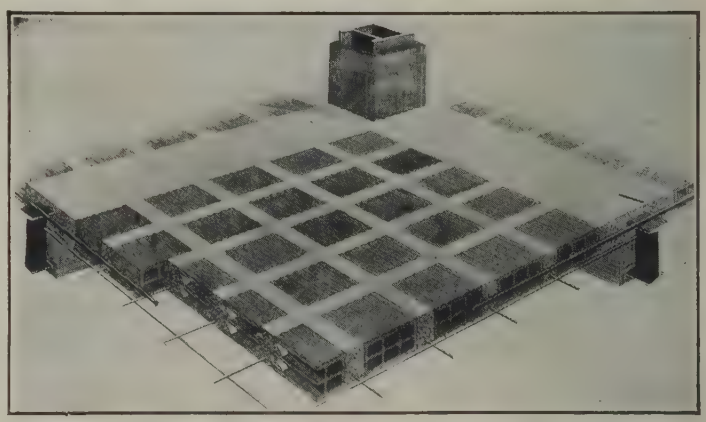
Tile used in shear and compression provides sufficient shearing area at the ends of each joist, and eliminates the top concrete required by other floor systems as compressive area to develop the reinforcement. The tile is not a mere filler adding useless dead weight but is a structural member of the slab.

Load distribution equal to that obtained with flat slab construction is secured. Heavy concentrated loads distribute themselves over two or more joists in each direction. This means that substantially there is no such thing as a concentrated load with Schuster hollow tile floors.

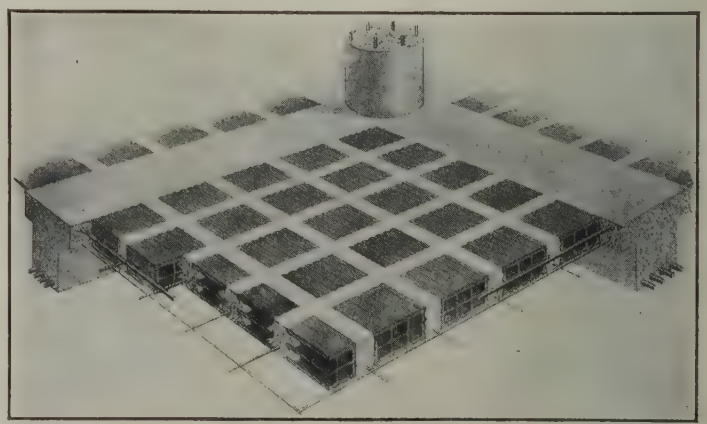
Slab thickness from 3 to 7 inches less in depth than that required by a one-way type of construction permits a total saving often amounting to an entire story height of the building. This means a material saving in masonry, pipes, conduits, stairs, etc.

Openings in the slab are easily handled. In many cases, special framing is unnecessary.

Plaster applied directly on the tile requires 2 coats, whereas plaster on mesh requires 3 coats. If an all-tile ceiling is desired, soffit tile are used.



Schuster Hollow Tile Floors with Structural Steel Beams and Columns



Schuster Hollow Tile Floors with Concrete Beams and Columns

Service

To aid architects and engineers in the design of Schuster hollow tile floors, an engineer will be sent to your office on request. He will be prepared to furnish complete design data, information regarding tests, and previous use of the system without any obligation being incurred on your part, and without expense to you.

Schuster hollow tile floors are a patented type of construction. We control the sale and use of the floors and our service to the architect and engineer consists in furnishing them with complete information necessary for the design, and furnishing the tile for the floors.

SERVICISED PRODUCTS CORPORATION

6051 W. 65th Street
CHICAGO, ILL.

Products

EXPANSION JOINTS; SATURATED FELT; GRAY FILLER; ASPHALT.

Also manufacturers of Bridge Flooring, Protection Course, Acoustical Board and Mouldings.

For Asphalt Roofing, Saturated Felt, Ridge Strips, Asbestos Cement Shingles, Slate Surfaced Shingles, Roof Cement and Oriental Roofing, see page A455.

For Wall Coping and Flashing Block, see page A557.

For Insulation, Roof Cement, Asphalt Paint and Industrial Flooring, see page B1996.

For Sewer Liners, Caulking Belts, Sewer Pipe Compound and Bitupack, see page C2737.

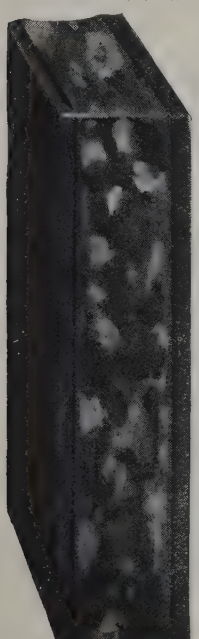
Servicised Reenforced Expansion Joints

These are prepared with an asphalt content ranging from 75 to 80 per cent, a fiber content approximately 15 per cent and a slight mineral content. They are manufactured strictly in accordance with Servicised processes, after years of careful research. The resilient, fibrated core aids in taking up the expansion and contraction of adjacent monolithic structures. The asphalts are refined in our own plant under careful supervision to avoid brittleness at freezing temperatures. The Servicised trade-mark is either on the crate or the sheet and protects the quality of the material.

Servicised Cork Seal Joint

This comprises a mixture of bituminous material and linear fiber surrounding and housing cork granules of sizable particles, locking them into place making this joint an exceedingly resilient expansion joint and one particularly designed for building purposes and where there is not an excessive amount of traffic.

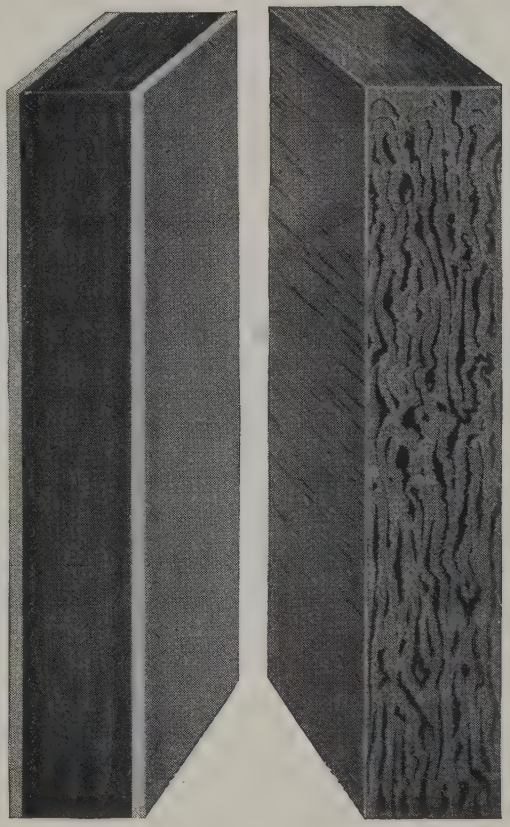
The ability of this joint to compress to 25 per cent of its volume and to react to its full volume is the result of one of the Servicised processes, attained through careful laboratory research. The Servicised label on this product stamps it strictly a Servicised quality product, fully protected in every way.



Servicised Cork Seal Joint

Servicised Gray Filler

This filler comprises a flowable mixture for the filling of cracks in cement floors, sidewalks, porticos, etc. It is particularly suitable for building purposes where crevices are to be filled in a flat surface. It is not adaptable for vertical surfaces. If such material is required, special mention should be made of such fact and the material can then be prepared to meet these requirements.



Servicised Type B Expansion Joint

This comprises a homogeneous mixture of irregularly overlapping mats of saturated fiber, with saturated linear fiber intermediate the mass. This joint has no felt sides but is finished with a pebbled surface, which enables the concrete to grip the sides. The effect of construction is that of a resilient mattress, and this also regulates the oozing or flow tendency, so that a mushroom is secured without excessive oozing which results in unsightly streaks at the expansion joint. Observation of Servicised Type B joint as now prepared will prove convincingly its superior quality, not only in its resiliency and powers to take up expansion and contraction, but in its ability to present a respectable appearance at the surface of the road without being flattened under the pressure of the traffic to unsightly ribbons 6 and 7 inches in width.

This Type has an asphalt content of approximately 75 per cent, a fiber content of approximately 15 per cent, and the balance consisting of inert and mineral matter. The Servicised label protects the quality of this material.

Servicised Type D Joint

This is a highly compressible dry fiber core having a high melting point asphalt surface penetration and coating. This material is particularly adapted for expansion and contraction where the space is to be filled for excessive expansion and contraction. It is likewise adapted to fit into places where the expansion joint is in danger of slipping through the crevices to the floor below. The elevations and depressions hold it in place, and this is strictly a Servicised departure. This type of material is suitable for insulation purposes, for lining around doors and windows, and is particularly free of moisture infiltration by reason of its thorough coating.

Servicised Saturated Felt

This comprises a high quality fiber content, fully saturated and well adapted to waterproofing and roofing purposes. The Servicised label on the saturated felt promptly identifies it as a Servicised product.

Servicised Asphalt

This is refined to a melting point between 250° and 260° with a penetration at 32° F. of 21° to 23° and at 115° F. from 35° to 40°.

This description of its quality should assure the user that he is securing a highly flexible, lasting material for roofing and waterproofing purposes.

Special asphalts furnished on request.

Expansion Joint Designed for Buildings, Stair Risers, Viaducts, Bridges, etc.

System "M"—A Steel Construction at the Cost of Concrete

System "M" is a patented type of light structural steel designed to combine with concrete. It retains all of the best features of the standard structural steel skeleton, *at but a portion of its cost.* It overcomes all of the objections to the ordinary bar reinforced concrete design, yet loses none of its economic advantages .

A Development of Engineering Experience

System "M" construction was developed and patented by Guy B. Waite as head of the organization known as "Guy B. Waite and Associates," of New York City.

Van Rensselaer P. Saxe, C. E., representing the Standard Concrete Steel Company of Baltimore, Md., was a member of this association.

Guy B. Waite and associated engineers were engaged thirty-five years ago in the design and erection of structural steel for buildings. Fireproofing was then in its early development.

It was a natural step for these men to turn from the fireproofing of steel to the design of reinforced concrete, in which they were pioneers.

The first concrete building in Manhattan was designed and erected by them under the first permit granted by the Borough of Manhattan for this type of construction.

This wide experience, with a full appreciation of the merits and faults of both structural steel and bar reinforced concrete constructions, resulted in the development of System "M" *which retains the best points of both.* The economy and practical worth of System "M" has been demonstrated in several hundred buildings.

The Advantages of Structural Steel

Structural steel has the double advantage of *speed* and *safety* in construction and this regardless of weather conditions.

It is rapidly erected, tier upon tier, irrespective of the rest of the construction work which follows the steel skeleton. It is safe in the assurance that all of the steel is included and accurately placed. It is not subject to errors and omissions, nor dangers of inclement weather.

The ordinary structural steel design is, however, *very wasteful of steel.*

Bar Reinforced Concrete

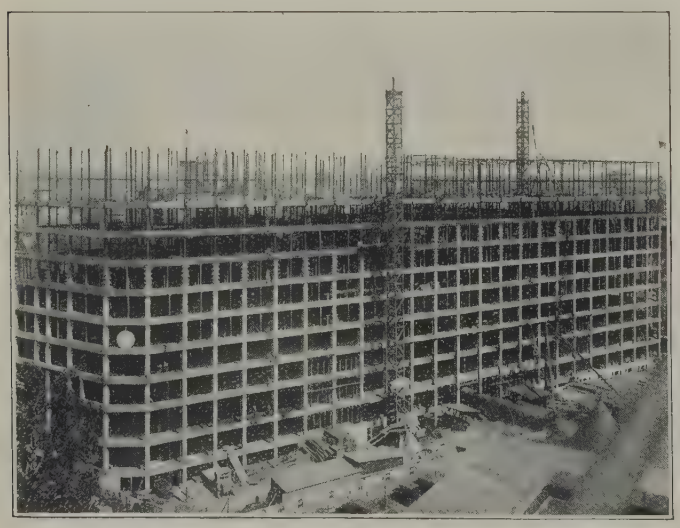
Experience has shown that bar reinforced concrete necessitates an intelligent, painstaking organization to overcome the *personal equation* and insure permanent, accurate locations of the steel reinforcement. The wood forms must precede the placing of steel and concrete.

Construction can proceed only as rapidly as the completion of the forms will permit, one story at a time, and not until the concrete of one story is poured and set can the forms for the story above be commenced.

So slow is this process at best, that in an endeavor to speed up the construction, it is but natural to rush both the placing of the complicated steel reinforcement and the pouring of the concrete. This tends towards carelessness, resulting in errors and omissions.

Weather conditions are an important factor.

Once the concrete is poured and set, corrections or changes are difficult if not impossible. Serious and costly accidents occur when, in attempting to save on centering lumber costs, forms are removed while the concrete is green. Bar reinforced concrete has one advantage, it is an economical construction—*economical if time required in construction is not considered.*



Skeleton

Finished

War Risk Bureau, Washington, D. C.
Wyatt & Nolting, Architects, Baltimore, Md.

System "M" was substituted, under the architects' recommendation, for the original structural steel design. Floor live loads varied from 50 to 300 pounds—all structural requirements of the original design were fulfilled. The saving was $180,000.00 in 1917

Continued on next page

System "M" An Economic Achievement

General—System "M" is a method of construction developed to overcome the objection to reinforced concrete and preserve the virtue of structural steel construction.

In practice, it substitutes a light structural steel member for the complicated mass of bars used in reinforced concrete.

A fabricated, light structural steel frame is erected similar to the standard steel skeleton construction, the floor members are, however, but about one-third as heavy. The structural steel members of this frame ultimately become the reinforcement in the construction.

Tests—System "M" has passed all of the standard test requirements for strength, fire and water. It meets all building code requirements of the City of New York. At the Columbia University laboratories it has received rigid scientific tests. It has passed successfully all State and individual loading tests wherever these have been required. *Copies of certified tests will be furnished on request.*

Design—System "M" is adapted to any design where standard structural steel can be used, with the advantage that it is more flexible. It has none of the limitations of bar reinforced concrete.

System "M" saves form 40% to 60% of steel (dependent on capacity and span) over the standard structural steel design.

A few steel sizes cover a wide variety of requirements. The small steel floor members (about one-third the weight used in standard structural steel design) are customarily carried in stock in sufficient quantities to assure prompt fabrication and delivery.

Owing to the reduced size of System "M" steel floor beams, the floor construction is monolithic as compared to that of standard structural steel design, where the fireproof floor slab is virtually cut in two by the depth of the heavier steel beam. System "M" floors act as horizontal trusses taking up and distributing vibrations, shocks and wind pressure (see typical comparative floor sections).

Since System "M" is a combination of structural steel and concrete in which each element complements and assists the other, by slight variations in the amount of concrete used the steel may be lightened or made heavier, thus increasing the factor of flexibility in design.

System "M" floor beams are in actual use with spans up to 50 ft. and carrying loads up to 1500 lb. per sq. ft.

System "M" floors are supported by built-up angle or channel columns, stiffened with concrete, designed to utilize the full unit working stresses of the steel. Where the size of this type of column is objectionable, the standard Bethlehem steel column may be substituted. Column connections may be either riveted or bolted—the wind-bracing is provided as in structural steel design.

Erection

System "M" is erected exactly like the standard structural steel skeleton and can therefore proceed safely *regardless of weather conditions.*

The light steel skeleton, preceding all other construction work above the foundation, is erected with the greatest degree of *speed and accuracy, maintaining correct lines and levels* for the work which follows.

The light structural members of System "M," as compared with standard structural steel design, require less and lighter erection equipment with the resultant economy in *cost* and *time* of erection.

References

System "M" has been successfully used in hundreds of buildings of note.

A complete list of these buildings, where located, and their architects, many of whom are nationally known, will be furnished for reference.

Engineering Service

A well organized engineering service is maintained to design and supervise the erection of System "M" construction. This service includes the making of complete structural plans, details and specifications, including design of the foundations, the checking of all shop drawings and details, supervising the erection, as the architect's representative.

The preliminary engineering service costs nothing. When a completed System "M" is used, then a royalty is charged, based on the square footage of the building.

System "M" Compared with Structural Steel

←≪ *Left.*

Section showing typical System "M" Floor Construction. Note small steel beam set low in concrete.

Right ≫→

Section showing typical Structural Steel Construction. Steel beam virtually cuts floor slab in two.

Note carefully the difference in the weight of steel required in these two typical plans carrying the same live load. System "M" floor slab is monolithic; tie rods are eliminated and the construction is absolutely fireproof. The fireproofing of standard structural steel, because of the difficulty of properly covering it with concrete, is often doubtful. Both Systems of Construction can be erected in the same time.

Triangle Mesh and Electrically Welded Wire Fabrics for Concrete Reinforcement.

For Triangle Mesh, for Stucco Base, see page B1673; for Electrical Wires and Cables, see pages C3416-3423; for Wire Rope, see pages C3658-3661.

Uses

Triangle Mesh and Electrically Welded Wire Fabrics are used for the reinforcing of concrete floor and roof slabs, concrete walls and chimneys, arch construction, beams, columns, dams and retaining walls, water, sewer and culvert pipe, pavements and roadways, river revetment, silos, fireproofing steel framing, bridge floors, reservoirs, monolithic concrete sewers and stucco work.

Advantages of Wire Fabric Reinforcement

(1) Provides even distribution of steel.
(2) Reinforces in every direction.
(3) Tension or carrying members accurately spaced.
(4) Low cost of inspection.
(5) Properly distributes over a large area stresses due to concentrated load.
(6) Due to cold drawing, higher elastic limits and ultimate strengths with same quality of steel.
(7) Continuous action from one end of the structure to the other.
(8) Impossible to leave out or otherwise reduce the necessary steel if specific style number of fabric or area of steel is specified.
(9) Perfect mechanical bond.
(10) Easily handled and stored on the work.
(11) Minimum cost of installation.

Grade of Steel

A reduction of the required sectional area of steel is safely accomplished, within limits, by the use of a higher tensile strength steel. This high tensile strength may be secured by increasing the carbon content or by cold drawing of mild steel.

Cold drawing of mild steel produces a high ultimate strength and yield point, and the proportion of the yield point to the ultimate strength is increased to from 70 to 90%. Since the strength of a reinforced concrete structure, in so far as the reinforcement is concerned, depends on the yield point of the steel, the high yield point of cold drawn wire is of great importance.

Galvanizing

Triangle Mesh Reinforcement is furnished plain on orders unless otherwise specified.

American Electrically Welded Fabric is furnished plain or galvanized as ordered.

In general, the additional cost for galvanized fabric is not justified except in special cases where the steel will be inadequately protected, as in very thin slabs, etc.

Triangle Mesh Woven Wire Concrete Reinforcement

Triangle Mesh Fabric is made from cold drawn mild steel having an ultimate strength of 70,000 to 85,000 lb. per sq. in. The longitudinal members are spaced 4 in., the diagonal cross wires either 2, 4, or 8 in. It is the only design of wire fabric having cross wires that assist the longitudinals in carrying the load.

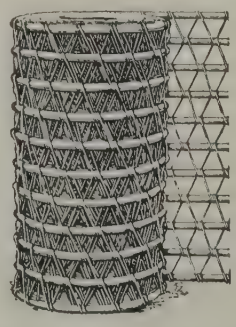

Fig. 1. Triangle Mesh Wire Fabric Reinforcement

*United States Steel Products Company.

Continued on next page

For the light styles of fabric, the longitudinals consist of 1 wire; for the medium styles, 2 wires laid parallel; and for the heavy styles, 3 wires stranded. The sizes of the wires and the number per longitudinal are varied to obtain the desired cross-sectional area of steel per foot of width. Stranded longitudinals are used to reduce the stiffness of the finished product without affecting the tensile strength.

Rolls: Standard lengths 150, 200 and 300 ft.
Widths: Approximately 16, 20, 24, 28, 32, 36, 40, 44, 48, 52 and 56 in.
Finish: Plain or galvanized.
Tensile strength: Standard, 70,000 to 85,000 lb. per sq. in.

Electrically Welded Wire Fabric Reinforcement

A square or rectangular mesh made from cold drawn steel wire electrically welded at the intersections of the transverse and longitudinal wires. Various combinations of spacings and sizes of wires can be furnished.

This material combines the same high quality of material and service that has given Triangle Mesh reinforcement its enviable reputation.

When embedded in concrete, this mesh yields the maximum of its steel strength.

Other styles can be furnished on application.
Rolls: Standard lengths 150, 200 and 300 ft. For No. 2 gauge wires and larger, flat sheets only.
Widths: Multiples of the spacing of longitudinal wires up to a maximum width which varies with the size and spacing of the longitudinals. Approximate maximums 56 to 72 in. for 2-in. spacing, 84 to 96 in. for 3 or 4-in. spacing, and 96 to 120 in. for 6-in. spacing.
Finish: Plain or galvanized.
Tensile Strength: Standard, 60,000 to 70,000 lb. per sq. in.; 70,000 to 80,000 lb. furnished when ordered.
Weights—All above weights are based on a width of 60 in. measured from center to center of the outside or selvage longitudinal wires.

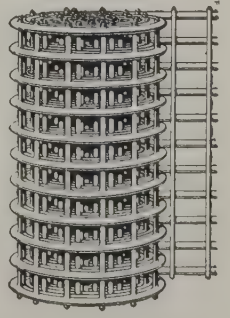

Fig. 2. Electrically Welded Wire Fabric Reinforcement

AREA OF STEEL AND THICKNESS OF SLAB REQUIRED FOR GIVEN SPANS AND LOADS

Bending moment=$WL^2 \div 12$. Center of steel ¾ in. above bottom of slab.
Reinforcement in each case is sufficient for the live load shown plus the weight of the concrete slab. Any dead load of the floor exclusive of the concrete slab should be considered as part of the live load shown here.
Maximum stresses: Steel=18,000 lb., Concrete=700 lb.

Note: If not restricted by building code to a stress in the steel of 18,000 lb., a stress of 20,000 lb. can safely be used for wire mesh reinforcement. For a steel stress of 20,000 lb. reduce the areas of steel shown in the table by 10%.
After hundreds of tests of actual slabs made by the Testing Laboratory of Columbia University, the City of New York prepared a code covering slabs having spans of 8 ft. or less and decided on the use of an empirical formula that is equivalent to assuming a working stress in the steel in the standard formula for reinforced concrete design of approximately 32,000 lb. per sq. in. Millions of square feet of reinforced concrete floors have been built in accordance with this New York code.

Live load per sq. ft. lb.	Span of slab, center to center of supports, ft.-in.

See tables on preceding page for styles of Triangle Mesh and American Electrically Welded Fabric that will give required areas.

Wire Fabric Reinforced Slabs

Supporting the Mesh Reinforcement—The correct location of the reinforcing mesh in the top portion of slabs over concrete beams can be easily and cheaply obtained by means of precast concrete blocks as shown in Fig. 3.

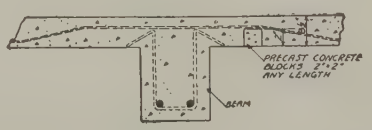

Fig. 3. Inexpensive Method of Supporting Wire Mesh Reinforcement Over Concrete Beams

Blocks should have a height about 1¼ or 1½ in. less than the full thickness of the slab. The length may be any convenient amount such as 1 or 2 ft. or such lengths as are readily formed by breaking long strips of the blocks. The mesh should be supported for at least one-third of its width. These blocks will stay in approximately correct position without any means of attachment to the reinforcing mesh or to the forms.

For short spans (about 8 ft. or less) these blocks will be required on one side only of the beams. For spans greater than 8 ft., use blocks on both sides.

Detailing Widths of Mesh—For estimating purposes where accuracy is unnecessary, provided the estimate is on the safe side, it is permissible to assume that the mesh required will equal in square feet the actual area of the floor slab. As a matter of fact, the amount of mesh needed will be less than that, and at the same time a more efficient and more economical layout is possible. In the first place, a 2-in. lap along the sides of the sheets of wire mesh reinforcement is sufficient to develop the full strength of the reinforcement; more

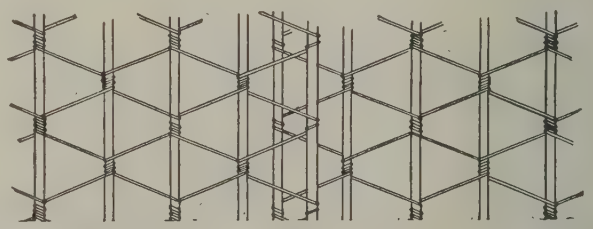

Fig. 4. Triangle Mesh Reinforcement As It Actually Appears with a Side Lap of 2 in.

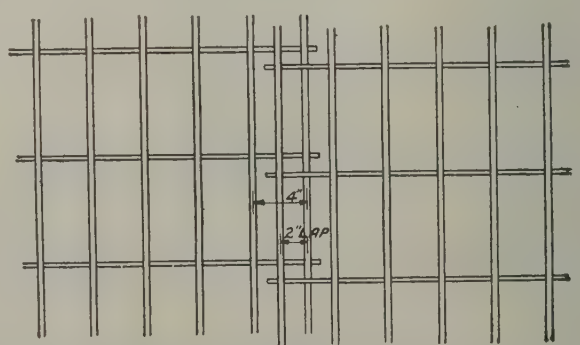

Fig. 5. Electrically Welded Fabric As It Actually Appears with a Side Lap of 2 in.

Continued on next page

than that is a waste of material. This 2-in. lap means a lap of the outside (or selvage) longitudinal wires and should not be assumed for those forms of mesh having a zigzag selvage edge.

A suggested detail for the amount and location of wire mesh reinforcement is shown in Fig. 6. Providing a short strip of light weight fabric is placed near the top of the slab over the girders with the main longitudinal wires at right angles to the direction of the girders, it is not only unnecessary but a waste of material to require that the main reinforcement of the slabs entirely cover the space between and over the girders. The distance between the center line of the girder and the edge of the reinforcing fabric can be any amount up to about 20 in. without reducing the strength of the structure.

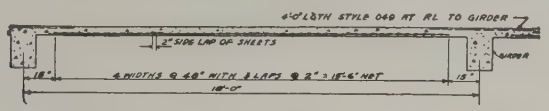

Fig. 6. Detailing Widths of Mesh and Showing Extra Strip of Mesh Over the Girders

Other Uses of Wire Mesh Reinforcement

Concrete Joist Floors—Fig. 7 shows a typical section of such a floor. Here is a 2 or 3-in. slab having a clear span between the supporting ribs of 23 in., that must not only act as part of the compression portion of the beams and resist temperature stresses, but in addition act as a support of the loads that may come upon the floor.

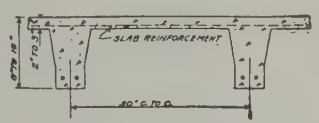

Fig. 7. Typical Section of Concrete Joist Floor

The most efficient type of reinforcement to take care of these various stresses is a fabricated mesh made from cold drawn high elastic limit wire with comparatively close spacing of members.

Top Layer of Concrete Finished Floors—It is often desirable for construction reasons to leave the ¾ or 1-in. top dressing until after the main part of the slab is completely hardened. In this case the slab should be thoroughly cleaned before applying the final course, and this course should be reinforced with wire mesh reinforcement to prevent destructive cracks.

Specify Style 032 Triangle Mesh or 4x4-in. mesh No. 12 by No. 12 gauge wires Electrically Welded wire fabric.

Basement and Other Floors that Rest Upon the Ground—As conditions vary with each job, it is impossible to make any definite suggestions regarding the proper weight of fabric to use, but millions of square feet of Style 049 Triangle Mesh have been successfully used for this purpose. Where heavy loads and questionable fill-foundations occur, it will be economy to use heavier mesh, such, for instance, as Style 153 Triangle Mesh or an equivalent weight of Electrically Welded wire fabric having spacings of wires that do not exceed 6 in.

Flat Slab Beamless Floors—Wire fabric reinforcement has been successfully used for this type of construction. It can be furnished in rolls or flat sheets.

This material is most desirable and it is highly recommended.

Cement Gun Work—Gunite (trade-name) is concrete applied by the cement gun process, which produces probably the densest and, therefore, the most waterproof concrete available by present known methods.

Gunite reinforced with wire fabric reinforcement has repaired successfully old crumbling bridge piers, tunnel linings and sea walls; old steel bridges, tanks and trusses; leaky reservoirs and irrigation ditches; even wooden structures that have been damaged by fire have been restored to usefulness by this method. And repair work is by no means the most important class of work produced. All kinds of new construction, especially those requiring waterproof qualities with light resulting weight, can be successfully executed.

Fireproofing of Steel Framing—Wrap all steel columns, girders and beams with Triangle Mesh, Style 032, or Electrically Welded fabric, 4x4-in. mesh, all No. 12 gauge wires.

Concrete Chimneys—Style 153 Triangle Mesh is standard for the circumferential reinforcement.

Stucco Reinforcement—See page B1673.

Concrete Sewers—The close spacing of members of Triangle Mesh is largely responsible for the successful results obtained with precast sewer pipe. The weight of fabric varies with the diameter of pipe, thickness of shell and depth of fill.

Concrete Driveways, Streets and Highways—Wire fabric reinforcement is essential to prevent destructive cracks. The purpose of the reinforcement is to increase the structural strength of the concrete slab and also to bind it together as a unit. The high tensile strength and the close spacing of members of a wire fabric show decided advantages for these purposes. The weight of wire fabric used in pavement has varied on account of varying conditions, but the average practice calls for 35 to 50 lb. per 100 cu. ft.

Suggested Specifications for Pavements—Reinforcement shall consist of steel wire fabric manufactured from cold drawn wire, finished members of which shall develop an ultimate tensile strength of at least 70,000 lb. per sq. in. and which shall bend cold 180° around a pin the diameter of which is equal to diameter of wire specimen without cracking on outside of bent portion.

All reinforcement shall be free from excessive rust, scale, paint or coating of any character which will tend to prevent proper bonding of the concrete.

The fabric reinforcement shall weigh not less than 40 lb. per 100 sq. ft.

The main or heavier wires of fabric shall be spaced not more than 6 in. apart. The secondary or lighter wires of fabric shall be spaced not more than 12 in. apart.

Introducing Our New Billet and Rail Steel Mill

Products

CONCRETE REINFORCEMENT: Round and Square Bars and Collapsible Column Spirals.

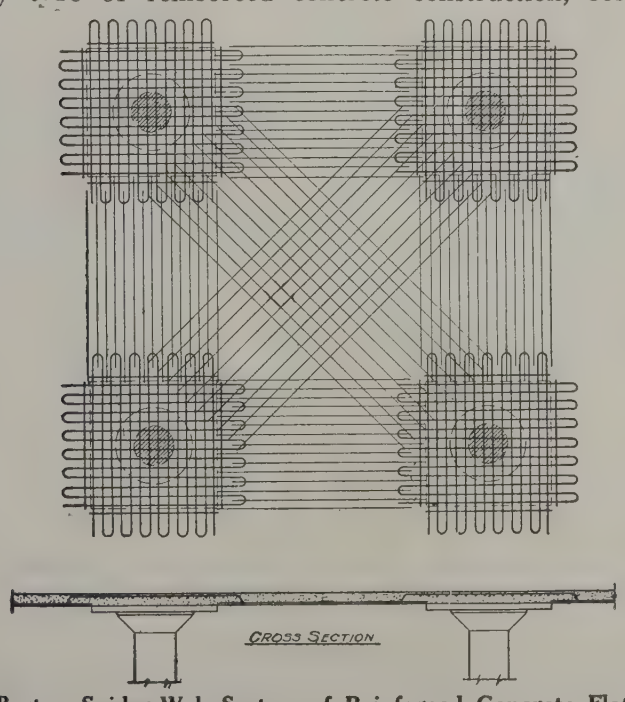
CONCRETE REINFORCEMENT DEVICES and ACCESSORIES: Combination High and Screed Chairs, Bar Chairs, Slab Bar Spacers, Joist Bar Spacers, Beam Bar Spacers, Concrete-to-brick Anchors, Concrete Inserts, Continuous Collapsible Stirrups; BARTON PAN (with integral lath) and BARTON LONG SPAN METAL LATH.

BARTON NAILING STRIP, a Combination Nailing Strip, Sleeper Anchor and Floor Screed.

Concrete Engineering Service

BARTON STEEL CO. is the owner of U. S. Patents No. 1,335,780 and 1,217,645 covering the broad use of combination and two and four-way belts of rods in reinforced concrete flat slab construction and permits only its authorized licensees to incorporate this system in their designs. Infringers will be prosecuted.

We also furnish complete engineering services for any type of reinforced concrete construction, for a nominal fee, whether or not the Barton Spider-Web System is used.



Barton Spider-Web System of Reinforced Concrete Flat Slab Construction

Barton Spider-Web System of Reinforced Concrete Flat Slab Construction

The combination of two-way and four-way belts of rods in reinforced concrete flat slab construction covered by the above mentioned patents is altogether distinctive.

We license architects and engineers to employ the Barton Spider-Web System in plans for a very nominal fee. We do not license contractors or material dealers. Correspondence invited.

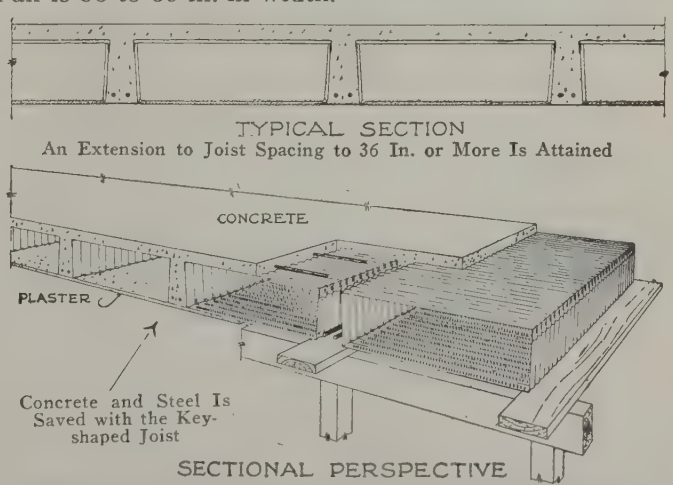
Description—The illustration shows the method of placing the reinforcing steel in the Barton Mat or Type A system. Factory-fabricated units (or mats) consist of continuous looped bars with ends bent down so as to regulate the exact height of the unit and to act as spacers for the lower bars. One such unit or mat is placed in each direction over the column head to take care of the negative stresses. Positive stresses at the center of span are taken care of by belts of rods extending from column to column, both directly and diagonally, covering the entire panel area and resting near bottom of slab. These rods are short and easy to handle.

Advantages—Insures maximum economy of design because it makes possible larger effective depths in the slab.

The Barton Spider-Web System results in a flat, level ceiling without the use of beams or girders. This permits light to be diffused over the entire ceiling and allows sprinkler heads to be economically spaced so as to save up to 25% of the cost of the sprinkler equipment. Trolley beams can be placed flat against the ceiling instead of being hung on beams and hangers.

Barton Pan and Barton Jumbo Pan for Reinforced Concrete Joist Construction

Barton Pan is 10 to 36 in. in width. Barton Jumbo Pan is 36 to 60 in. in width.



Barton Plan for Reinforced Concrete Joist Construction

Continued on next page

The Barton Pan combines joist, ceiling and floor construction. The bottom of the pan is formed into metal lath, the heaviest on the market, dipped after being punched and has special claws for holding plaster besides ordinary perforations. The Barton Pan is properly set—not inverted—instantly ready for plastering and floor finishing.

Advantages—Simple in erection, easy and time-saving in handling; insures stiffness and rigidity. Top easily removable for installing pipes, conduits, boxes and anchorage means.

No concrete is damaged in removing forms. Joists are always straight, shores can be removed speedily.

Watertight construction insures hard concrete. The Barton Pan saves time, labor and materials. Can be used in rows of any length.

Made from special hard steel sheets, with deep corrugations.

The outstanding feature of the Barton Pan is its reduction of dead load through its key-shaped joist as against the present wedge shape. By this means, the Barton Pan can save 20 to 27% of concrete required by ordinary removable and permanent pan construction and a resulting saving in steel.

Specifications of Pan Construction—The system of concrete floor and roof construction unless otherwise shown on the plans shall be a combination of concrete joists with the Barton Pan with integral lath, complete with end panels where required, manufactured by the Barton Steel Co.

All tile to be standard tile where possible, with approximate right angle—Barton Bend—at all angles.

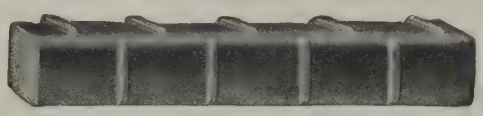
Tile shall lap adjacent tile and shall accurately fit into each other as provided. At the end of each row of tile, where rows join girders or walls, provide Barton End Units, locking same into the last corrugations, not stretched.

The lath formation shall be dipped in a good paint after being manufactured.

The Bar-Ton-Bar

Rolled from new billet stock open hearth steel and conform to the specifications of the Association of American Steel Manufacturers. Made in square and round deformed sections in sizes 3/8 to 1¼ in., the corners of the square bars being rounded to prevent splitting of the concrete.

Furnished cut to length and bent at mill or warehouse. Large stocks for immediate shipment.



Square Deformed Bar

Round Deformed Bar

Barton Patented Collapsible Column Spiral

Coiled by machinery of special design (assuring uniformity of diameter) and assembled with the Barton patented link spacer.

Furnished in any length and in diameters of 10 to 38 in., inclusive; pitch, 1 to 4 in. Carried in stock; immediate shipments assured

Barton Continuous Collapsible Stirrups

Shop fabricated and ready for the forms. No individual stirrups, chairs or wire to be misplaced or lost on the job. Being one piece, it is easy to handle and requires little storage space.

Barton Continuous Collapsible Stirrup

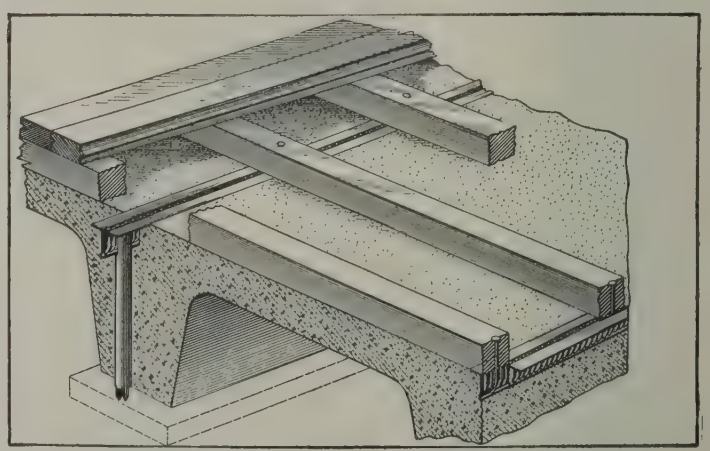
Individual stirrups properly spaced and joined with the Barton patented tie rod become continuous collapsible stirrups. When so connected, the individual stirrups can not shift or change spacing.

At regular intervals, stirrups, specially designed to form legs, are placed. These support the other stirrups and the reinforcing bars at the proper distance from the bottom of the form. Chairs are integral.

Barton Nailing Strip

A combination nailing strip, sleeper anchor and floor screed. This metal strip with its supporting unit (height in accordance with requirements) is simple to install. It is placed immediately after setting the metal forms and reinforcing steel and automatically acts as the screed for the concrete floor slab.

Floor sleepers may be anchored at any spacing desired by nailing to this strip. It may also be used where padding and carpet are placed directly above the concrete as in hotels and office buildings. When placed in joist, beam, wall and column forms, it may be used for the installation of suspended ceilings, metal lath and wall furring and as an anchoring device for various purposes. It makes possible the use of concrete lumber for fireproof partitions and other construction.



Barton Nailing Strip

Barton Combination High and Screed Chairs

Used for accurately locating and holding top reinforcing rods over column heads, over indirect bands in two-way flat slab construction and over beams and girders; also for supporting screeds in connection with floor slabs. Locking prong to hold bars in place, also wire and rail holes. Extra large seating area giving maximum strength. Sizes carried in stock from 3 to 9 in. high.

Continued on next page

Barton Bar Chairs

Furnished in place of the Barton combination high and screed chairs, where the bars over column heads are only 2 or 3 in. in height. Made of strip steel and furnished for exact height as called for on steel plans.

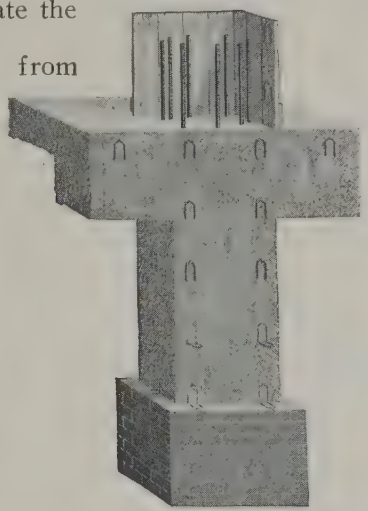
Barton Concrete-to-brick Anchors (Patented)

These devices are used for bonding brick veneer, stone, terra cotta or tile wainscoting to concrete surfaces. They are nailed to the inside of the form and left in place when the latter are removed.

Barton anchors are economical because no expensive drilling through forms is necessary to install them and because they do not mutilate the forms.

Immediate shipments from stock.

Anchor Nailed on Form Preparatory to Pouring of Concrete

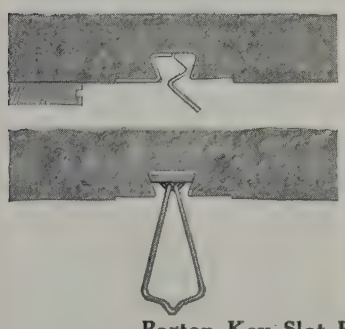


Anchors Left in Place Upon Removal of Forms

Barton Concrete-to-brick Anchors

Barton Key Slot Forms and Anchors (Patents Pending)

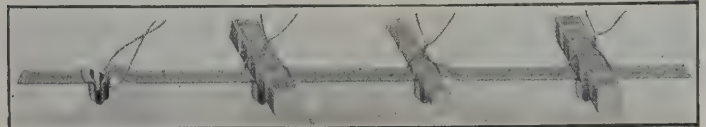
A system of metal forms that are removable from a key-shaped channel in concrete construction. With this system key-shaped anchors are inserted to fasten veneer of terra cotta, face brick, stone or any masonry to concrete after cement forms are removed.



Barton Key Slot Forms and Anchors

Barton Slab Bar Strip Spacer (Patented)

This strip spacer is well known and serves the same purpose as Barton slab bar spacer. It is made up special for each job.



Showing Bars Spaced, Supported and Tied on Barton Slab Bar Spacers

Barton Joist Bar Spacers

Designed to carry either one or two bars and are adaptable to any type of ribbed floor construction. Carried in stock and furnished in any width or height to meet the requirements. Made of strip steel, a combination of strength and durability.

Barton Beam Bar Spacers

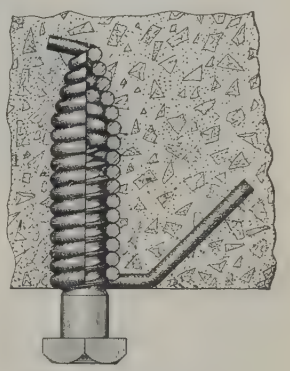
Made from strip steel with a large seating area for each bar. Will not tip. Carried in stock and furnished for exact height and width of beam and number of bars in each layer.

Barton Patented Concrete Inserts

Barton concrete inserts are used in concrete slabs, beams or columns for attaching shaft hangers, pipes, fixtures, sprinkler systems. etc. They are made of special drawn wire and are so coiled that the threads of standard lag bolts will mesh with them.

Their carrying capacity has been demonstrated by many years use and by Robert W. Hunt tests. They are the lowest priced inserts on the market because no unnecessary material is used in their construction.

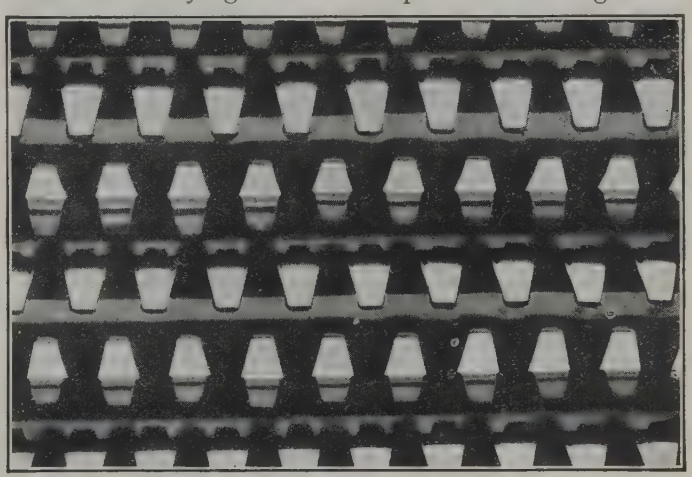
In ½, ⅝ and ¾-in. sizes, with or without lag bolts. Stocked for immediate shipment.



Barton Concrete Insert—Lag Bolt in Place

Barton Long Span Metal Lath

A new style of metal lath. The unique feature is that it is made from steel sheets, with deep corrugations. The sides of the corrugations are punched to form talons or claws lying within the depth of the corrugations.



Barton Long Span Double Lath

The outstanding characteristics of the lath are:

Strength: made from special hard material for ceiling work, it allows a spacing of channel supports of 36 in. or more.

A true surface and minimum thickness of finished plaster work, as the outer surface of the corrugations provides a *rigid* and *perfectly level* troweling surface.

Economy: because the inner or back surface of the corrugations prevents more plaster being forced through than is necessary for a good *key.*

A good key and *a good clinch,* from the formation of the talons or claws between corrugations.

Spanning 36-in. centers, it eliminates intermediate channels and pencil rods, saving this cost and the time and labor cost of their installation.

CONCRETE CLIP & WIRE CO.

Manufacturers of Wire and Flat Steel Products for Building Construction

536-548 East 133rd Street, NEW YORK, N. Y.

Products

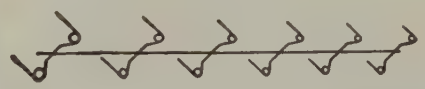
WIRE CLIP REINFORCEMENT for Concrete Fireproofing; HANGERS and HAIRPINS for Suspended Ceiling Construction; REINFORCING BAR CUTTERS and BENDERS; FORM SPACERS; CORNER BEAD; BASE BEAD.

Also Steel and Galvanized Mortar Boxes, Special Tools, Bridle Irons, Wall Ties and Ashlar Anchors.

Wire Clip Reinforcement

In order to prevent concrete fireproofing from cracking and falling off, wire clips, providing the necessary reinforcements, are attached to the bottom of structural steel members. They are manufactured in several styles and the choice of styles is a matter of personal preference. The Economy Type Clip is approved and used by well known architects as the pictures of installations on these pages indicate. Many years experience has proved to these architects that a clip must be designed with the longitudinal wire up close to the structural member so that concrete with an aggregate will flow easily.

Economy Clips—The Economy Clip (Fig. 52) is made of 12 gauge material. The longitudinal member is 5 ft. long and six clips are electrically welded to it 11½ in. apart. It is important that no air space or pockets be left between the soffit and the structural member. In the Economy Clip the longitudinal wire is not held away from the member where it will impede the flow of concrete but is held close to the underside in order that the soffit can be poured solidly without air pockets. The loops of the clips extend down 1¼ in. under the flange, reinforcing the soffit corners. On wide flanges, it is necessary and advisable to use two longitudinal members. The free ends of the loops bend up over the lower flange and are long enough to take care of all the new sizes of Carnegie and Bethlehem sections. Economy Clips are made to take care of any flange from 3 in. up to the largest girder size. Sizes vary by inches.



Economy Clips Welded to Spacing Wire

Continued on next page

Fig. 51. Master Clip

Fig. 53. Individual Clip

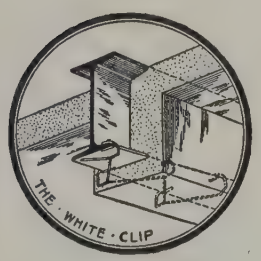

Fig. 54

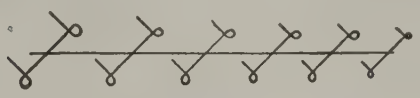
Master Clips—The Master Clip (Fig. 51) has the loops extending beyond the edges of flange of the structural member, thereby providing the reinforcing loops at the outside corners.

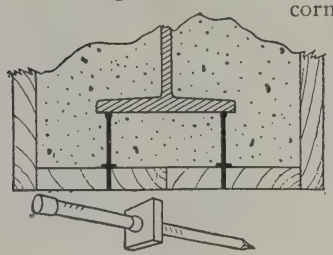


Master Clips Welded to Spacing Wire

Sizes—Both Master and Economy Clips are generally furnished electrically welded, 11½ in. apart, to a longitudinal spacing wire 5 ft. long; and packed 50 lengths (250 ft.) per bundle. This spacing may be varied to meet special conditions.

Wire wall ties, either the Economy type, Master, or the clip shown in Fig. 53 may be furnished individually without being welded to a spacing wire. In this form they are used as concrete and *brick wall ties.*

White Clip—The White Clip (Fig. 54) is furnished in straight lengths and is zigzagged across the beam flange very much like lacing up a shoe. The advantages of this clip are that it grips the flange very tightly, as each clip pulls hard on its neighbors; the flow of concrete is assisted by the diagonal direction of the wires. The clips proper extend beyond the flange reinforcing the corners of the soffit.



Economy Form Spacer

Economy Form Spacers

These are furnished to accurately space forms, giving an equal thickness of fireproofing at all points with a minimum of field labor.

Made in sizes 1½, 1¾, 2, 2½ and 3 in.

Economy Corner Bead—Rail Type

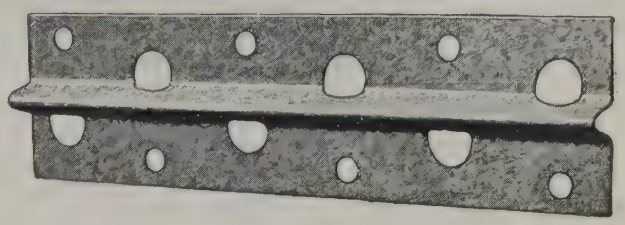
Made from 24 gauge tight coat galvanized sheets (non-rusting).

Stock lengths: 6 ft., 7 ft., 7 ft. 6 in., 8 ft., 8 ft. 6 in., 9 ft., 9 ft. 6 in., 10 ft., 11 ft. 12 ft.

Packed 25 pieces per bundle.
Weight: 150 lb. per 1000 ft.
Clips for nailing furnished—one per foot plus.

Economy Straight Point Base Bead

Made from 24 gauge tight coat galvanized sheets (non-rusting).



Stock length: 10 ft.
Weight: 190 lb. per 1000 ft.
Packed 12 pieces per bundle.

For Havemeyer Truss, see page A664.

Engineering Departments

Experienced and efficient engineering departments are maintained in our district sales offices and will lend every assistance in solving all concrete reinforcement problems.

Havemeyer Concrete Reinforcement Bars

These deformed bars (Figs. 1 and 2) are rolled in square and round sections, with the deformations running longitudinally and entering directly into the tensile strength of the bar, no metal being used for the mechanical bond only. At all points they have constant uniform area of cross section exactly equal to the cross-sectional area of a plain bar of same size. Thus the purchaser secures all the advantages of a deformed bar with the same weight as a plain bar. He does not have to pay extra for the weight of the lugs.

As the projections and depressions are rolled longitudinally, there are no sharp angles to start a fracture when bar is bent. Tests prove the very superior bending qualities of Havemeyer bars.

Specifications for Steel—Havemeyer bars are rolled to any desired standard specification from new billet steel at mills which do not re-roll rails. This eliminates all possibility of substitution of inferior metal.

Shop Bending and Fabricating—Our warehouses are equipped for accurately bending and fabricating bars. This service eliminates a bending gang and bending machines on the job. Our warehouse charges for bending are less than it would cost the contractor if he did the work himself. Furthermore, shop bending assures the architect that every bar is bent accurately.

Fabricated units can be made up in our warehouses by using Havemeyer Beam-Saddles, Bar-Tys, etc., assuring proper spacing and placing of bars.

Havemeyer deformed bars have a uniform area of cross section and the same weight per foot as plain bars.

Above standardized sizes recommended by the War Industry Board and adopted by the American Concrete Institute and by the Distributors of Reinforcing Bars.

Collapsible Column Reinforcement

Havemeyer Collapsible Column Spiral—Wire is accurately coiled to proper diameter and correctly spaced with a rigid spacer. Shipped collapsed, ready to be opened up and placed in the form.

Havemeyer Collapsible Columns — Havemeyer bars used for longitudinal members and for bands, the latter being attached to longitudinal members by Bar-Tys. Shipped collapsed for convenience in shipping and handling. Readily opened and set in place. These can be fabricated in our warehouses or by the contractor on the job. The use of Bar-Tys constitutes the cheapest method of assembling column steel.

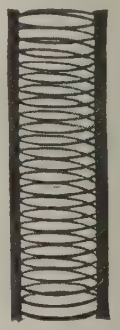

Fig. 3. Collapsible Spiral

Fig. 4. Collapsible Column

Securo Bar-Spacers for Supporting, Spacing and Holding Slab Reinforcing Bars

Made from hoop steel. Locking prongs and legs self-contained. Facilitate inspection—a missing bar is detected by its absence from the chair seat.

Standard height from underside of bar to form, ½, ¾ and 1 in. Minimum spacing between bars, 3 in. Booklet No. A8.

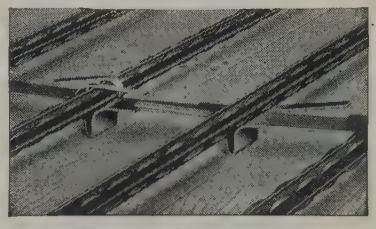

Fig. 5. Bar-Spacer

Havemeyer Bar-Tys for Tying Together Reinforcing Bars at Intersections

Used for tying together bars in walls, bent-up bars to supporting rods in slab, tying stirrups to beam bars, for fabricating columns, etc. More quickly attached than soft wire and much more secure.

Made from high grade spring steel wire in various sizes to accommodate any combination of bars.

Carried in stock.

Booklet No. A4.

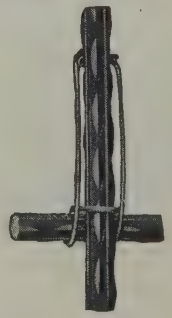

Fig. 6. Bar-Ty

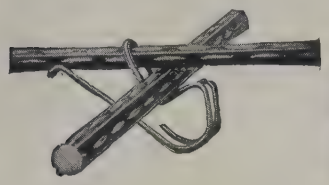
Continued on next page

Havemeyer Ty-Chairs for Tying and Supporting Slab Reinforcing Bars

Quick, simple and economical. Made from high grade spring steel wire.

Standard distance from underside of bar to forms, 1 in.; special, ¾ to 2 in. Made in various sizes to accommodate any combination of bars used. Carried in stock. Booklet No. A4.



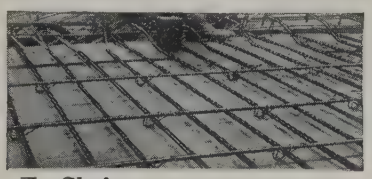


Fig. 7. Ty-Chair

One Ty-Chair used at each intersection on large bars and at every third intersection on small bars

Havemeyer Hy-Chairs for Supporting Head Rods Over Columns and Bent-up Bars in Slabs

Cheaper and better than concrete blocks. Made from pressed steel, beaded for strength and punched with locking prong and nailing holes.

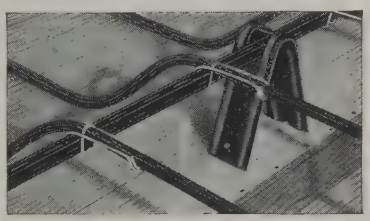

Fig. 8. Hy-Chair

Shipped nested. Easily carried and quickly distributed. Maximum size bar, ¾ in. Range in height from 1½ to 8½ in. Provided with nailing holes to insure retaining position in forms when concrete is poured. Booklet No. A8.

Havemeyer Easel-Chairs for Supporting and Spacing Two Bars in a Joist

Used in terra cotta and steel tile construction. Made from high grade spring steel wire. Spring of locking arm securely holds bars in place. Single easel-chairs support one bar and both arms lock on the bar; double easel-chairs support two bars, one arm locking on one bar and the other arm on the opposite.

Standard distance from underside of bar to forms, 1 in.; special, ¾ to 2 in. Carried in stock. Booklet No. A4.

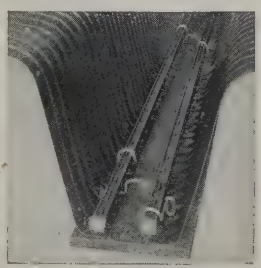

Fig. 9. Easel-Chair

Havemeyer Beam-Saddles and Separators for Supporting, Spacing and Holding Reinforcing Bars in Beams, Girders, Lintels, etc.

Saddles space and support lower layer of bars; separators space and support the upper layer.

Standard height from under side of bar to forms, 1½ and 2 in. Made ½ in. short of beam widths. Standard clear distance between layers, 1 in. Made from hoop steel. Locking prongs hold bars in position. Booklet No. A8.

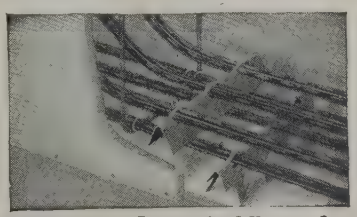

Fig. 10. Beam-Saddle and Separator

Havemeyer Round Nose Curb Bars

Staggered and flared anchors act as reinforcement. Absence of continuous web permits accurate and even bending without kinking. Stocked in 10 and 12-ft. lengths, galvanized. Booklet No. A6.

Fig. 11. Round Nose Curb Bar

Havemeyer Angle Nose Curb Bars

We also make angle nose curb bars for stair nosings and platform edges. Booklet No. A6.

Security Anchor and Wall-Tys

Used especially for bonding brick veneer, stone, terra-cotta or tile wainscoting to concrete surfaces. Also used for holding metal lath ceilings and for anchoring floor screeds.

Anchor is made from hoop steel; Tys from steel spring wire. Standard length of anchors is 8 ft.

No. 3 No. 5

Fig. 13. Dayton Adjustable-Inserts

Concrete Inserts

Dayton Adjustable-Inserts—Made from highest grade malleable iron, cast in one piece with keyhole slot for adjustment.

No. 3 is for ¼ to ⅞-in. standard bolts; No. 5 for ⅜ to ¾-in. standard bolts, inclusive. Carried in stock. Booklet No. A7.

Havemeyer "Y" Socket-Inserts—Made from highest grade malleable iron. Broad nailing base with four *nailing* holes insures against displacement. Accommodate ⅜ to ¾-in. bolts with standard thread, both inclusive. Carried in stock. Booklet No. A7.

Fig. 14. "Y" Socket-Insert

Havemeyer Slotted-Inserts—Made from high grade pressed steel. Standard lengths, 12, 18, 24, 36 in. Accommodate ½, ⅝ and ¾-in. bolts; ⅞-in. bolt special. Have 6 nailing holes. Closed slot and removable end caps prevent seepage of concrete to inside. Can be used singly, or, with end caps removed, can be placed end to end for a continuous run. Carried in stock. Booklet No. A7.

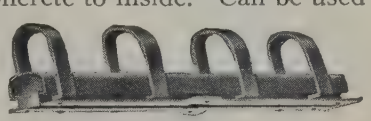

Fig. 15. Slotted-Insert

Havemeyer Metal Lath

An ideal base for ceilings, walls, partitions and exterior stucco work. A stiff heavy product made of

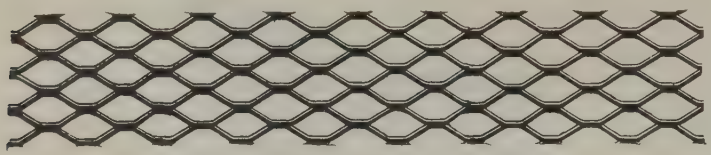

Fig. 16. Havemeyer Flat Lath

steel, plain or galvanized, or of pure iron, especially well suited for overcoating or long spans.

WEIGHTS OF HAVEMEYER LATH

2.2 lb. per sq. yd.	*3.00 lb. per sq. yd.
*2.5 lb. per sq. yd.	*3.40 lb. per sq. yd.

*Asterisk indicates weights that are standard.
All sheets are 24x96 in.; 1⅓ sq. yd. per sheet; 9 sheets per bundle: 16 sq. yd. per bundle.

Flat-Rib Metal Lath

Has reinforcing ribs ½ in. wide, 1¾ in. apart center to center. A rigid, flat, strong lath, permitting wide spacing of studs, joists or channels, saving both labor and material.

Sheets are square and there is no loss in laps. They permit scratching in of the mortar and doubling back from same scaffold, practically two-coat work; a decided economy in both mortar and labor.

Weights per yard: painted, 2.75, 3.0, 3.4 and 4.0 lb.; galvanized, 3.6 lb. Sheets are 24x96 in., 9 sheets to the bundle, covering 16 sq. yds.

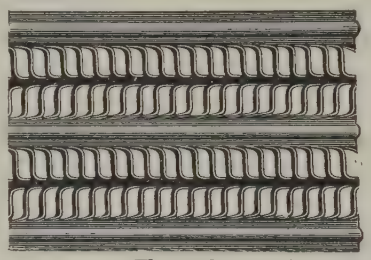

Fig. 17. Flat-Rib Metal Lath

Havemeyer ¾-in. Rib Lath

For roof construction, partitions, floor slabs, outside walls, etc.

Havemeyer Expanded Metal

Sizes with large diamonds are used for reinforcing, especially for culverts, sewers, bridges, tanks, etc. Smaller diamonds for machinery guards, enclosures, railings, lockers, stucco, etc. Furnished in full range of sizes from 3x7 in. to ½x1¾ in.

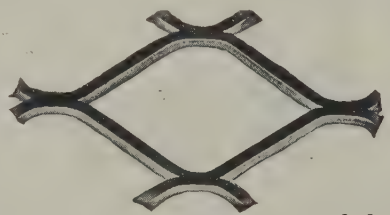

Fig. 18. Havemeyer Expanded Metal

Havemeyer Channels, Angles, Flats

Hot Rolled—Furnished in any size on short notice.

Cold Formed—For suspended ceilings, furring, columns, false beams, cornice work, or for solid or hollow partitions. Stock lengths, 12, 14, 16, 18 and 20 ft.

Wire Mesh

A. S. and W. Triangle and Electric Weld; stock or mill shipments.

Havemeyer Corner Beads

Wing Bead—No. 26 gauge special analysis galvanized sheet. Stock lengths, 6, 7, 8, 9, 10 and 12 ft.; 10 pieces to bundle; weight, 200 lb. per 1000 ft.

Curved Point Base Screed—Forms a permanent ground for plastering and secures a sanitary base with precisely true lines. Fabricated from tightcoat galvanized open-hearth sheets. Lengths 10 and 12 ft. Weight 195 lb., crated, per 1000 ft.

Bull Nose Bead—No. 28 gauge galvanized steel, ¾-in. radius. Lengths, 6, 7, 8, 9 and 10 ft.; weight, 245 lb. per 1000 ft. Also furnished No. 26 gauge, 290 lb. per 1000 ft.

Base Bead

For cement base No. 26 gauge galvanized sheets. 12 pieces per bundle; weight, 140 lb. per 1000 ft.

Expansion Corner Beads

Made of tightcoat, galvanized, open-hearth steel. Takes much less time to erect than other types.

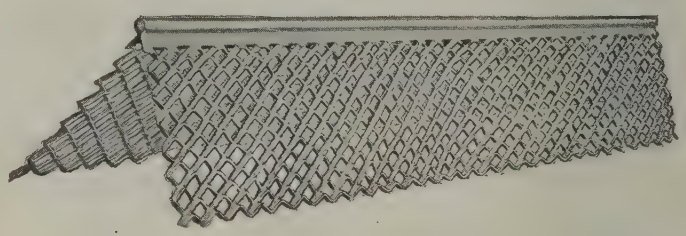

Fig. 20. Expansion Corner Beads

Furnished in 6, 7, 8, 9, 10 and 12-ft. lengths. Weight per 1000 ft., 240 lb.

Also cut from pure copper or zinc for exterior use with stucco.

Expansion Bull Nose Bead

Weight: No. 26 gauge, 375 lb.; No. 24 gauge, 470 lb.

Expansion Trim

Information furnished on request.

Havemeyer ⅜-in. Rib Lath

An exceptionally stiff metal lath—A labor and material saver, therefore a money saver.

Sheets are 24x96 in.; ribs spaced 4.8 in. center to center; ribs ⅜ in. high. Rapid erection results from using a smooth sheet. Economy results from perfect fit of interlocking ribs along sides and ends, from reduced number of fastenings to supports, and from saving in material by spacing supports further apart without sacrificing stiffness of plaster.

Fig. 21. Havemeyer ⅜-in. Rib Lath

Products

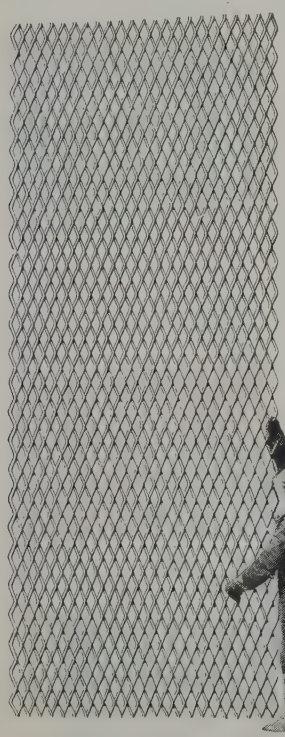
Concrete Reinforcement; Machine Guard Mesh; Materials for Window Guards.

For "Steelcrete" Expanded Metal for the construction of Armored Vaults, see pages A1338-1339; for "Steelcrete" Metal Lath, see page B1693.

Steelcrete Concrete Reinforcement

Steelcrete Concrete Reinforcement is an expanded metal product—*not welded*. It is cold drawn from a solid sheet of steel and has a guaranteed elastic limit 60% higher than commercial medium steel. It costs less "in place" than materials having considerably lower reinforcing values.

The reinforcing efficiency of Steelcrete Mesh has been tested time and time again. The Holland Vehicular Tunnel is a splendid example. This great "driveway" under the Hudson River is reinforced below water entirely with Steelcrete.



Steelcrete Concrete Reinforcement comes in large flat sheets which are easily placed. It is adaptable to various shapes of construction, being supplied in weights which are especially suitable for floors, tunnels, tanks, culverts, retaining walls, conduits and sewers.

Concrete Floors Laid on the Ground

In the construction of the Quartermaster's Terminal and Arsenals, Edgewood, Md., over a *million* square feet of floors were laid using Steelcrete Reinforcing Mesh.

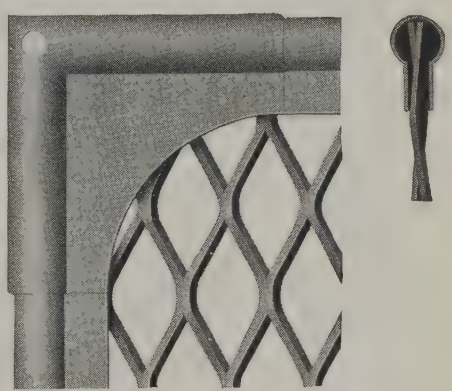
Steelcrete Reinforced Concrete Floor Slabs are a definite source of economy both in original cost and last cost. Wherever concrete floors are to be laid, it is good business to specify Steelcrete.

Steelcrete Frame Bar and Accessories for Framing Steelcrete Diamond Mesh

Steelcrete Diamond Mesh Fabric, Underwriter's Inspected, in small size diamond meshes suitable for window guards and shop partitions, is obtainable in large flat sheets.

This Company also produces a heavy tube shaped section known as Steelcrete Frame Bar, which is suitable for framing Steelcrete Mesh, making a strong, attractive panel frame; also accessories for joining frame bar at corners; other accessories for quickly attaching the guards to the building structure. All are illustrated in "Steelcrete Industrial Mesh Hand Book." Materials are furnished either plain or galvanized as required.

The Consolidated Expanded Metal Companies furnish materials only. Finished guards can be obtained through a hundred or more authorized guard contractors conveniently located throughout the United States. Name of the nearest contractor making this type of window guard furnished on request. Let us send a complete set of specifications, and sample of Steelcrete to your desk for inspection.



Materials

Underwriters' Steelcrete and Steelcrete accessories are obtainable from our nearest branch warehouse. Send for catalogue. State whether you are interested in finished guards or materials for making same.

Booklets

"Steelcrete Industrial Mesh Hand Book"—Complete data on Steelcrete and accessories for industrial uses including window guards and machine guards.

"Steelcrete Frame Bar Catalogue"—Complete information including specifications on frame bar window guards for those interested in finished guards only.

Products

J & L Bars for Concrete Reinforcement.

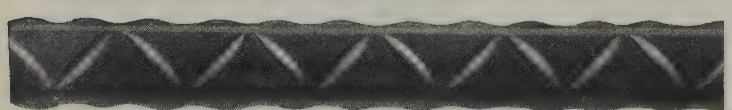
Also J & L Structural Shapes and Fabricated Structural Work, Columns, Girders, Trusses, Plate Work, Tanks, Mill and Factory Buildings; J & L Steel Piling; J & L Wire Products.

For J & L Junior Beams, see pages A667-669; for J & L Light Weight Channels for Stair Stringers and Other Uses, see page A739; for J & L Tubular Products, see pages C2720-2721.

Description—Concrete Reinforcement Bars

J & L Diamond Bars are rolled from new billet steel and are tested to standard specifications. Each has uniform cross section, without offset, carrying the stresses evenly. Ribs are clean cut and accurate, balancing each other in two opposite spirals. The ribs run at angles of 45°, giving maximum areas to resist slipping. There are no sharp edges or corners, thereby assuring intimate and thorough contact with the concrete. Sizes are easily identified, round sections for the standard round equivalents. gothic sections for the standard square equivalents.

& L Round Equivalent Deformed



J & L Square Equivalent Deformed

STANDARD SIZES

Size, in.	Area, sq. in.	Weight per ft.
* ¼ round	.049	.167
⅜ round	.110	.376
½ round	.196	.668
½ square	.250	.850
⅝ round	.307	1.043
¾ round	.442	1.502
⅞ round	.601	2.044
1 round	.785	2.670
1 square	1.000	3.400
1⅛ square	1.266	4.303
1¼ square	1.563	5.313

*Furnished in plain round.

Column Spirals

Spirals are fabricated with two or more channel spacers as desired. This permits the spirals to be shipped collapsed ready to set in forms.

A complete stock of standard sizes is carried in both hot rolled and cold drawn wire.

Quick shipment assured.

STANDARD SIZES SPIRAL WIRE

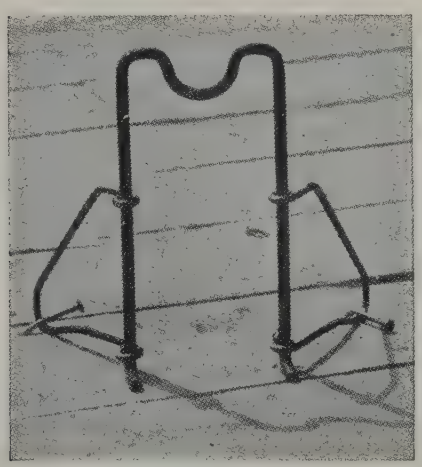
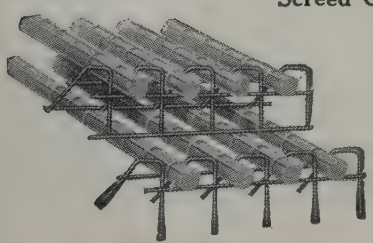
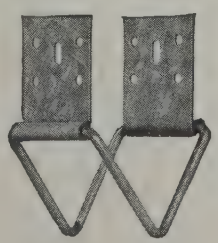
Round and Square Corrugated Bars



Screed Chair



Beam Chairs



Sleeper Anchor

Removable Tile

Kalman Removable Steel Tile are used in forming reinforced concrete ribbed slabs in buildings. Because of the large investment involved, the tile are leased instead of sold to the contractor and are erected by our field organization, the Corr Service Erection Co.

Kalman Removable Steel Tile actually save time, labor, and money. The tile are kept in perfect condition, cleaned, and re-formed after every job. Complete information can be had on request.

Column Forms

Adjustable metal forms strongly and simply made. They produce true round columns with accurate and graceful profiles where the flared head merges with the shaft. Kalman Column Forms are furnished to contractors on a lease and erection basis.

Column Form

Bar Supports and Spacers

Kalman offers a complete line of bar supports and spacers to aid in the accurate and economical setting of reinforcing steel. These products include the new Kalman High Chair (for use with either tees or bars), beam chairs, rib chairs, bar chairs, beam bolsters, bar clips, and several types of slab spacers.

The New Kalman Slab Spacer (Clip Type)

This spacer above is representative of the efficiency for which Kalman accessories are designed. The legs of the spacer are spaced exactly as specified. On each leg is a strong wire spring clamp. The steel setter drops the bar over each leg—stepping on each bar as they go—with the result that the bar is automatically forced into the spring clamp and locked against movement in any direction. Such efficiency means new setting speed, new spacing accuracy, and new low costs.

Other Products

In addition to the line of bar supports and spacers, Kalman offers the new screed chair, adjustable and hanger inserts, and sleeper anchors. Write for bulletins on these various products.

Engineering Service

Expert engineering service is one of the most valuable features of the KALMAN STEEL COMPANY Service. At all district sales offices expert help is available on matters of estimate, design, and detail of reinforced concrete structures of all types, together with reliable advice concerning the use and purposes of all Kalman products.

Standardized Metal Caging (Pat. Dec. 15, 1914)

"SMC," for fireproofing steel structures. A wire basket or cage (see illustration) which firmly grips beam flange extending below and beyond flange, permanently locking concrete protection to steel, thereby providing a continuous strengthening skeleton at a *pre-determined or fixed offset distance from the flange.*

Application of Standardized Metal Casing

End wire of section is caught over end of beam, and workman easily holds and pulls out section, which automatically locks to the structural member. Stretch out after applying

"SMC" cannot "bunch"; it pulls out like a camera bellows, maintaining equal spacing of about 5 in. under middle of beam. It clasps flange tightly at edges leaving a clear space for flow of concrete under flange. When used on girders, columns or deep beams, additional wires of special shape (see HS below) may be used to reinforce the side protection or haunches.

Exclusive features shown in illustration. "SMC" comes to job ready to use and can be easily applied by inexperienced labor.

"SMC" is shipped in collapsed sections about 4 ft. long, each containing 250 clamps, and is easy and inexpensive to handle. Such a section of size A, B, or C when pulled out, is sufficient to cover about 120 ft. of beam flange; 30 pieces of substitute material 4 ft. long or 120 pieces 1 ft. long would have to be handled for the same length of beam, and then would only provide a more or less unsatisfactory substitute.

SIZES OF "SMC" FOR COLUMNS

S. M. C. No.	Size of jaw opening	Width of flange	H Columns Caging for both flanges	Clamps per 100 lin. ft.
A	7⅜"x⅝"	4" – 5" 6" – 6½"	4", 5" 6", 8" H 23.5 to 34.5 lb.	400 450

TRUSCON STEEL COMPANY

Manufacturers of a Complete Line of Permanent Building Products Including Concrete Reinforcements and Forms

EXECUTIVE OFFICES AND PLANT

YOUNGSTOWN, OHIO

For Branch Offices, see Local Telephone Directory

Products

REINFORCING STEEL, KAHN TRUSSED BARS; RIB BARS; COLUMN HOOPING; STEEL FLORETYLES; CONCRETE INSERTS.

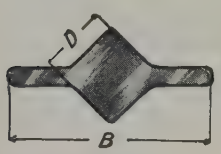
Also Curb Bars; Contraction Joints; Steel Road Forms; Welded Steel Fabric.

For other Truscon Products, see pages in this edition as follows:

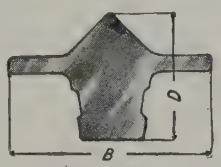
Steel Roof Decks, page A213.
Steel Joists, page A674.
Steel Doors, pages A986-987.
Steel Windows, pages A1299-1303.
Metal Lath, pages B1704-1705.

Kahn Trussed Bars

Open hearth steel, concrete beam, girder, floor and arch reinforcement. Unit bars with 45° rigid diagonals formed from flanges on the main body producing 12 to 30% stronger beams than loose stirrups; save steel in design and labor in installation; increases safety, fireproofness and shockproofness.



Section Kahn Trussed Bar



Section Kahn Trussed Bar

Rib Bars

Carried in stock in warehouses in various cities, furnished straight or bent as ordered.

Square Rib Bar

Round Rib Bar

Truscon Collapsible Column Hooping

Shipped in the form of flat, circular coils of exact diameter and accurately spaced by means of special spacers. Coils spring automatically into complete hooped column on cutting the fastening wires. Rib bars are ordinarily used as vertical reinforcement in conjunction with column hooping.

Diameter of coils: 9 to 36 in. Pitch: 1½, 2, 2½, and 3 in.

Truscon Floretyle Construction

Truscon Floretyle construction consists of rows of specially formed steel Floretyles separated by reinforced concrete joists and covered with a thin layer of concrete.

Ribbed Floretyles—Are manufactured in powerful presses operated with multiple dies which insure accuracy and uniformity. Deep stiffening ribs across the top give exceptional rigidity. Rib adjacent to one end is omitted, to readily obtain adjustment in the length of the row. The corrugated sides, rounded corners and corrugated flanges along the bottom edge add to the stiffness and prevent deformation.

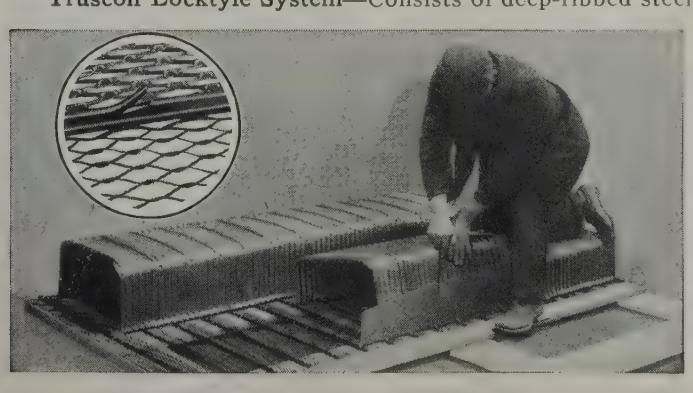
Truscon Locktyle System—Consists of deep-ribbed steel Floretyle whose flanges are locked into prongs of ribs of Truscon Locktyle Lath.

Is easily and speedily erected, saves in concrete and plastering cost and insures true and straight concrete joists with positive attachment of the ceiling in reinforced concrete construction. It insures constant width of concrete joists, making unnecessary the use of any spacers, and saves all expensive nailing of the steel Floretyle to the form boards.

Truscon Floretyle Construction, with Cantilever End Tyles—Used at the ends of the rows, provide the width of concrete joists adjacent to the supports necessary to take advantage of the greater economy obtained by increasing the negative bending moments and decreasing the positive bending moments. Shearing stresses are also more economically handled than by the use of loose stirrups. Cantilever Floretyle can be used either with ⅜-in. Hy-Rib ceiling or with Locktyle Lath.

Truscon Floretyle Construction with Removable Floretyles—Is economical in buildings comprised of several typical floors laid out in oblong panels, with long spans and not requiring a plastered ceiling. These Floretyles are usually leased to the contractor for the duration of the job. They are made of 16 gauge steel, so designed as to be readily removable, extremely sturdy and very economical. Ribs across the top add to rigidity and eliminate excessive crowning, which is wasteful of concrete. Furnished either with straight sides or with a ⅜-in. flange along the bottom edge.

Properties of Removable Floretyles—Heights: 6, 8, 10, 12, and 14 in. Approximate width at base: 20 in. Standard lengths (nominal): 3 ft. Actual length is 1 in. greater, to allow for end laps.



Placing Floretyles in Locktyle Construction
Inset shows close-up of lath prong

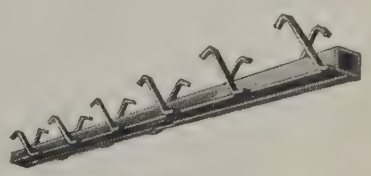
Truscon Wydespan Construction

Requires less concrete and less wasteful timber centering. Joist spacing is approximately 4 or 5 ft. and a top slab of only 2½ in. is recommended.

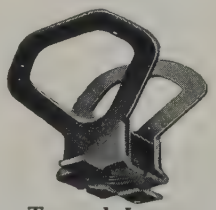
Properties of Truscon Wydespan Forms—Manufactured from 16 gauge steel. Height: 16 in. only—but adaptable for 5 to 15-in. depths of floors.* Approximte width at base: 40 and 52 in. Standard length (nominal); 12 in. Actual length 2 in. longer to allow for end laps.

Truscon Slotted Inserts

Used in concrete slabs, beams or columns for attaching shaft hangers, fixtures, sprinkler systems, etc. Obviate expensive drilling into concrete in finished building. Built into concrete during construction by fastening to wood centering. Standard lengths 12, 18, 24, 36, 48 and 60 in. For ½, ⅝, and ¾-in. bolts.



Slotted Insert



Tapped Insert

Truscon Tapped Inserts

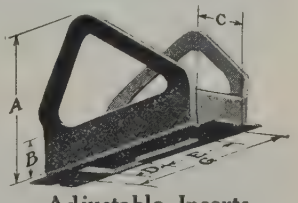
Made of highest quality pressed steel; furnished tapped for ½, ⅝ and ¾-in. bolts or ⅜-in. pipe.

Used where exact location of attachment is known. This insert is especially designed for plumbers who require one which will accommodate pipe rather than standard bolts.

Adjustable Inserts

DIMENSIONS OF TRUSCON ADJUSTABLE INSERTS (INCHES)

Size	A	B	C	D	E	G
½	2 3/8	¾	⅞	1 3/16	1 5/16	3
⅝	2 5/8	1	1 1/8	1	1 7/8	4
¾	2 3/4	1	1 1/4	1 5/16	1 11/16	5



Adjustable Inserts

*Forms are provided with nailholes to permit raising or lowering them on the centering to secure any desired depth floor and joist within the above limits.

Products

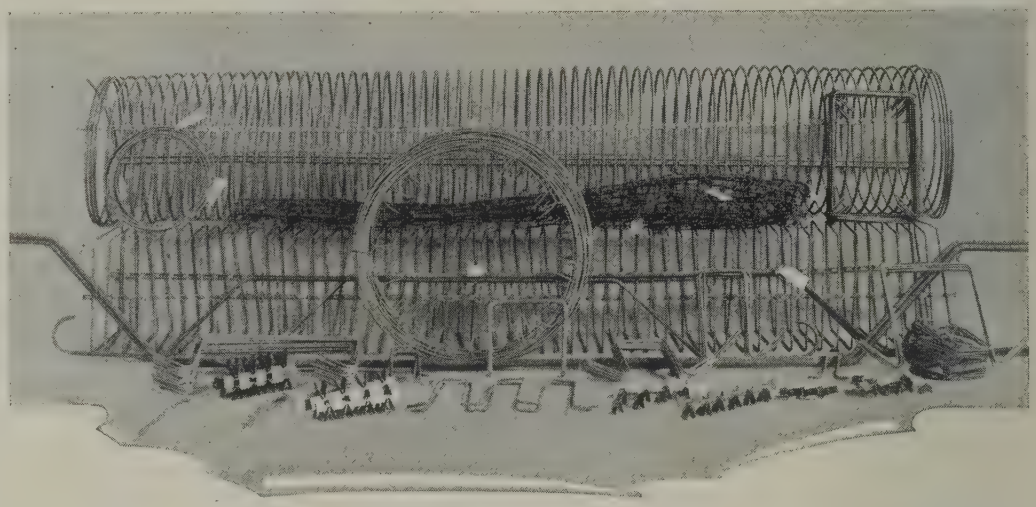
CONCRETE REINFORCING MATERIALS, including: Plain and Deformed Reinforcing Bars, Triangle Wire Mesh, Electrically Welded Rectangular Mesh, Column Spirals, Continuous Wire Mesh Stirrups, Beam Wrapping, Fabricated Units, Road Center Strips, Wire Rods, Wire, Furring Channels and Angles, Miscellaneous Reinforcing Accessories, such as Bar Chairs, Bar Spacers, Bar Ties, Inserts, etc.

EXPANDED METAL PRODUCTS, including: Expanded Metal Lath, Ryex Expanded Metal Reinforcing, Corner Beads, Metal Picture Mouldings, Base Screed, Base Grounds, Rib Lath.

SAFETY TREADS AND PLATES, including: Mason Safety Treads, Firmtread Floor Plates and Treads, Sheet Steel Subtreads and Risers.

IRON AND STEEL PRODUCTS, including: Bars, Bar Shapes, Structurals, Rails, Plates, Sheets, Boiler Tubes and Fittings, Shafting, Chain, Rivets, Bolts, Nails, Refined Iron, Alloy Steel, Tool Steel, etc.

SMALL TOOLS.

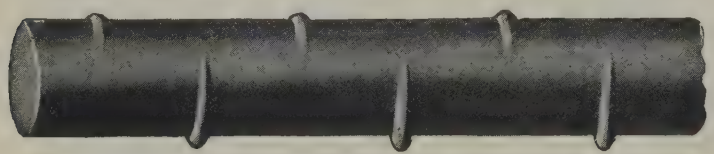


A Few Ryerson Reinforcing Products

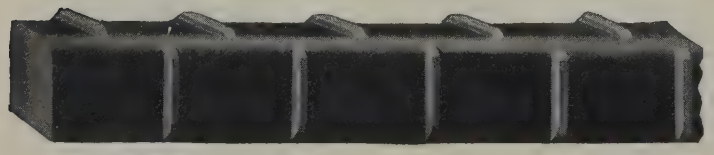
Bars

At our eight warehouse plants located throughout the country, we carry a complete stock of plain and deformed bars, both round and square. These bars are rolled from new billet stock, conforming to standard specifications of the American Society for Testing Materials, Serial Designation A-15-14. Bars, of structural, intermediate and hard grade, are carried in stock in lengths up to 60 ft.

Round deformed bars are carried in the following diameters: 3/8, 1/2, 5/8, 3/4, 7/8 and 1 in. Square deformed bars are carried in the following sizes: 1/2, 1, 1 1/8 and 1 1/4 in.



Ryerson Round Deformed Reinforcing Bar



Ryerson Square Deformed Reinforcing Bar

Bending and Fabricating

We have the most up-to-date machinery and other equipment for fabricating, and can bend bars to any shape required for beam, joist and slab rods, stirrups, ties, hoops, etc.

Spirals and Continuous Hooping

On our spiral machines we manufacture spirals for round columns, continuous uniform hooping for square and rectangular columns, and continuous single unit stirrups for beams and girders. Spirals are made from new first quality wire rod in sizes from $\frac{3}{16}$ to $\frac{9}{16}$ in., inclusive.

Both round and square hooping can be collapsed for shipment.

Triangle Wire Mesh Reinforcement

We always carry on hand a large stock of triangle wire mesh for slab reinforcement. This material is carried in rolls in standard gauges and sizes of mesh and can be shipped at once. Electrically welded rectangular mesh, is also in stock, or can be shipped direct from factory.

Road Strips and Highway Construction Material

We furnish completely fabricated material for reinforcing roads, culverts and bridges, including metal road strips and all necessary reinforcing fabrics, supports and spacers.

Accessories

In addition to bars and spirals, we carry complete stocks of all accessories such as beam, joist and slab bar spacers, bar and screed chairs, bar ties, wire, etc., also wire fabric and expanded metal for reinforcing roadways and for floor slabs, concrete pipe, etc., angles, channels

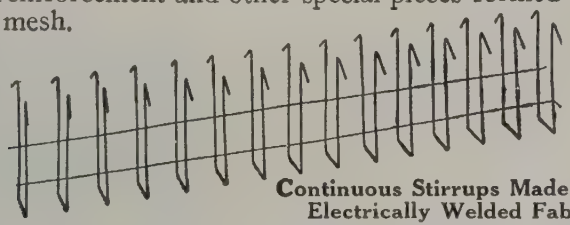
Continued on next page

and pencil rods for suspended ceilings, furring and similar purposes.

Continuous Wire Mesh Stirrups

Continuous wire mesh stirrups are formed on our specially constructed power machines, thus insuring accurate bending and perfect alignment. Continuous stirrups save time and money in the job, eliminating slow and tedious hand tying of bars and individual stirrups. Over 30,000 of these continuous stirrups were used in the construction of the Palmer House in Chicago.

We are also equipped to furnish beam wrapping, step reinforcement and other special pieces formed from wire mesh.



Continuous Stirrups Made from Electrically Welded Fabric

Ryex Expanded Metal Reinforcing

We are prepared to furnish from stock, expanded metal in meshes varying from ½x1¼ in. to 3x8 in. and in a wide range of standard sizes. Special meshes and sizes delivered promptly, direct from the factory.

Metal Lath, Plastering Channels, etc.

We are in a position to furnish all the steel requirements for plastering. This service includes expanded metal lath, rib lath, scotch lath, corner bead, bullnose corner bead, picture mould, curved point base screed, base grounds, hot rolled channels, cold formed channels, pencil rods, angles, tees, flats, wire, etc.

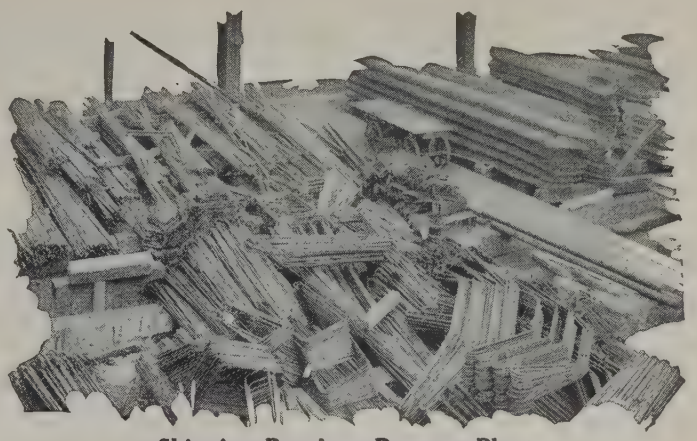
¾-in. Rib Lath
Deep ribs and strong mesh eliminate the need of wood forms

Immediate deliveries from our warehouse stocks or direct from factories in Chicago and the East.

Welded Steel Windows

Standard industrial units can be furnished at once from stock, either with or without ventilators. These windows are made of rolled sections, electrically welded at all intersections, giving the frame great rigidity and strength.

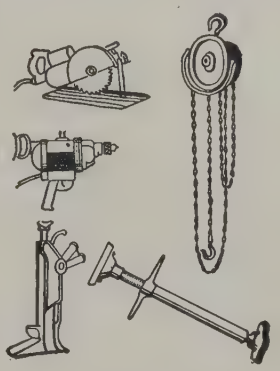
Continuous top hung windows with mechanical operators and architectural projected windows can be furnished to meet almost any requirement. Send your plans for prices and complete description of our complete service.



Shipping Bay in a Ryerson Plant
Reinforcing materials ready for loading

Small Tools

Prompt service on all the hundred and one small tools needed for construction work is another feature of our complete service to builders. Every tool is backed by the Ryerson Guarantee. If you haven't our tool catalogue and price list, write and we will mail them at once.

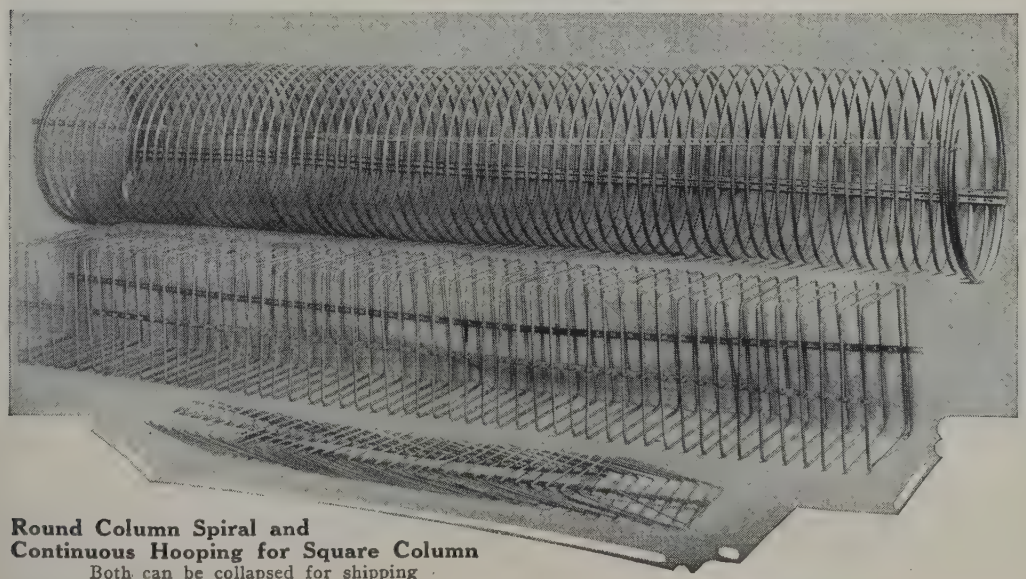


Portable electric saws, electric drills, trench braces, jacks, hoists, furnaces, reamers, rivet forges, riveting hammers, electric hammers, clamps, grinders, punches, shears, drift pins, etc., are a few of the items available.

Delivery

Our large stocks of bars and other material enable us to make exceptionally quick delivery on reinforcing material—all cut, bent, bundled and tagged ready for the forms. By use of special aluminum tags with stamped, raised letters and numerals, the identification marks showing the location in the building of each bundle can not be obliterated. These tags are not subject to rust. Specially designed 40-ft. trailers for tractors, with steel adjustable skids, enable us to haul the longest material and unload with a minimum of effort and without distortion or damage to the material. All of our Steel-Service Plants have private switch tracks connecting with trunk line railroads, affording exceptional service on freight shipments.

This Tag Identifies Each Piece



Round Column Spiral and Continuous Hooping for Square Column
Both can be collapsed for shipping

Ryerson Steel-Service

In addition to reinforcing materials we carry all kinds of steel products at each of our plants, thus giving the contractor a convenient source upon which to draw for such other steel as he may require on a job.

Product

CLINTON ELECTRICALLY WELDED WIRE FABRIC for Concrete Reinforcement.

For Wire Lath, see pages B1674-1677; for Metal Grilles, see page C3345.

Clinton Electrically Welded Wire Fabric

Scope of Use—Clinton welded wire, a mesh reinforcement, is especially suited for floors, roofs, walls, roads, sidewalks, sewers, reservoirs, levees and all kinds of slab construction.

The material is used to special advantage in all kinds of work involving the covering or protection of steel with concrete, as in buildings, bridges, subways and tunnels.

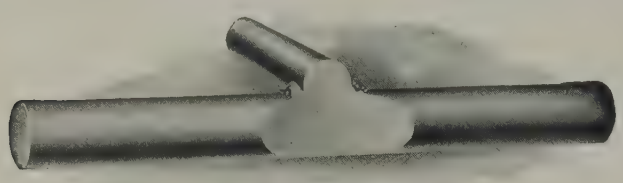
Material—Clinton electrically welded wire fabric is a wire mesh made up of a series of parallel longitudinal wires, spaced certain distances apart and held at intervals by means of transverse wires arranged at right angles to the longitudinal ones, and securely welded to them at the points of intersection by a patented electrical process.

Wire—Clinton electrically welded wire fabric is fabricated from a special grade of good quality steel wire, possessing such strength, elasticity, and ductility as to render it especially suited to structural use.

The wire will develop an average ultimate strength of 70,000 to 80,000 lbs., with a maximum, in some cases, of 85,000 lbs. per sq. in.

Innumerable tests and investigations which have been made upon welded wire during the past 15 years have proved that the process of welding does not in any way lessen the tensile strength of the longitudinal wires. Specimens when tested, whether they break at or between the welds, will invariably show the full tensile strength of the longitudinal wire when compared with the strength of the plain wire before welding.

Electric Weld—In Clinton welded wire the transverse wires are welded to the longitudinal wires by means of an electric current. They are not in any way secured by winding, or by loops or clips, and for this reason the casual observer sometimes concludes that the wires are merely soldered together. This idea is wrong. The connection is made by an absolute and perfect weld, in which the two wires are actually fused into one homogeneous section.



The Clinton Electric Weld

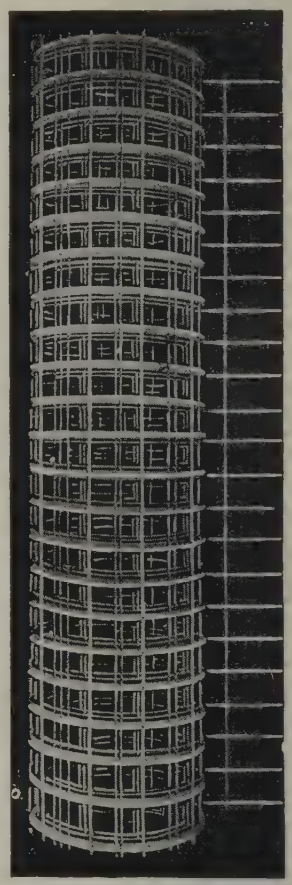
In this view the two wires have been cut through at their point of union, revealing a perfectly smooth surface. It is a perfect weld; the two wires are actually fused together

A great number of tests have been made upon the welded connections, and it has been shown that the shearing strength of the weld in many cases actually exceeds the tensile strength of the longitudinal wire.

Rectangular Mesh—Clinton welded wire is rectangular or square mesh. There are no zigzag or diagonal members in the material.

When used as reinforcement in floor slabs, the longitudinal members are thus located in the line of tension; while the transverse or secondary members, arranged at right angles to them, afford a most efficient means of distributing concentrated loads in a direction perpendicular to the main reinforcing members.

In floor slabs, designed and estimated on the basis of distributed loads, this is a most important factor in enabling a slab to receive a very heavy load on a small area. Clinton welded wire fabric, affording, as it does, an efficient transverse as well as longitudinal reinforcement, prevents cracking due to changes in temperature and provides a perfect network of steel which knits and binds the concrete together, reinforcing it securely in all directions.



Roll of Clinton Electrically Welded Wire, 48-in. Width

Shipped also in sheets if desired

Perfect Bond—There is perfect adhesion of concrete to this fabric, because it has no clips or wrapped wires to prevent free flow of the aggregate when it is being poured; therefore, no voids exist in the completed work. Transverse strands, which are of much heavier gauge than can be used in any other wire fabric, are securely welded to longitudinal strands at right angles to the latter, and provide absolute anchorage against movement of the fabric when subjected to strain.

Unbroken Continuity—By using Clinton welded wire in floor slabs it is possible to obtain a perfect continuity from span to span without any lapping or splicing of the members.

Fabric is delivered in rolls, and may be laid in continuous sheets up to 200 ft. in length. The result is no waste, no lapped ends, no weak points.

Continued on next page

Economy and Accuracy of Installation—The use of welded wire eliminates all cost and trouble involved in the spacing and wiring of loose members. Spacing is established by machinery, and it is impossible for the relative position of various members to become changed in the slightest degree.

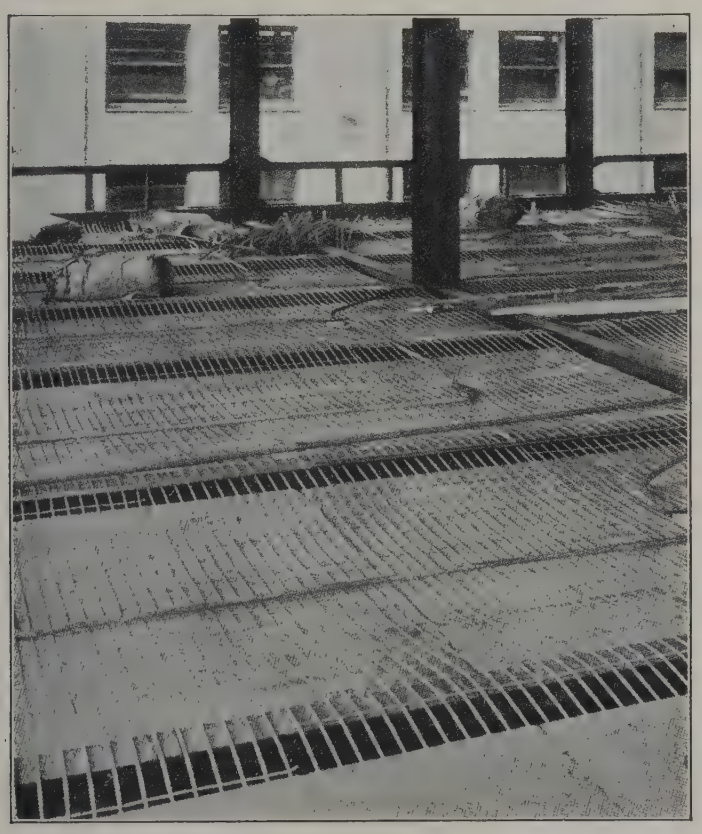
The fact that great quantities of material can be laid accurately in a very short time by unskilled labor, with absolute assurances that every strand of wire is in its proper position, renders welded wire the safest, simplest and most economical reinforcing material for all kinds of slab construction.

Finish—Unless otherwise ordered, Clinton electrically welded fabrics are furnished made with plain steel longitudinal and transverse strands. The price is lower than for fabrics galvanized throughout, the difference being controlled by the market price of spelter used in the galvanizing process.

Galvanizing—Clinton electrically welded fabrics are also made from steel wire, which is thoroughly galvanized before being welded. Galvanizing affords protection against the development of rust if the material is exposed to the weather by reason of delays in its use in the work, or if the concrete is of inferior quality and contains elements injurious to steel, or is so porous as to permit the entrance of moisture or destructive gases.

Reinforced Concrete Slab Tables

The tables following the illustrations of the arches are based on accepted formulæ. The loads given at heads of the varying tables cover customary roof and floor loads, and are the safe applied load in addition to the weight of the slab. No allowance, therefore, need be made for the weight of the slab. The tables have been compiled on a basis of a maximum compression in concrete of 650 lbs. per sq. in. with a maximum tension in the steel of 20,000 lbs. per sq. in.; spans being considered as continuous, i. e., $M=\frac{W1^2}{12}$



French Building, Fifth Avenue, New York, N. Y.

View during construction of floor, showing Clinton electrically welded wire in position, ready for pouring concrete; entire floor reinforced with drawn steel wire (the best known material for tensile reinforcement); every unit accurately spaced and securely held in its proper position—an unbroken continuity of reinforcement from one side of the building to the other

5	1	.....	3 x 16 6&10	3 x 16 4&9	2 x 16 4&9	2 x 16 1&7	.....	.....	.....	.....	.....	.....
6	1	.....	.....	3 x 16 5&10	3 x 16 3&8	2 x 16 4&9	2 x 16 2&8	.....	.....	.....	.....	.....
7	1	.....	.....	.....	3 x 16 4&9	2 x 16 5&10	2 x 16 3&8	2 x 16 2&8	.....	.....	.....	.....
8	1¼	.....	.....	.....	.....	3 x 16 3&8	2 x 16 4&9	2 x 16 3&8	2 x 16 1&7	.....	.....	.....

Note: Values in all these tables indicate size of mesh and gauge of wires in Clinton fabric. Thus, 4x16, 7&11 indicates a fabric having No. 7 gauge longitudinal wires on 4-in. centers welded to No. 11 gauge transverse wires on 16-in. centers.

Reinforcements below and to left of zigzag lines may also be safely used in cinder concrete without exceeding 300 lbs. per sq. in. compression in the concrete. In using cinder concrete, applied loads as given may be increased 3½ lbs. for each inch thickness of slab.

Wire

Size of Wire—The fabrics listed below are suggested as combinations which may be used to special advantage. While all of these fabrics are not actually carried in stock, the majority of them may usually be obtained upon short notice. When only a small quantity is desired it is sometimes less expensive to use a stock grade, even though it possesses greater strength than the work requires.

The longitudinal or transverse strands may be of Nos. 0 to 13 inclusive, Washburn & Moen gauge wire. When the same size of wire is not required in both members of the fabric, the heavier size can be placed longitudinally or transversely, as may be specified, but there should not be a difference exceeding 6 numbers on heavy grades, or 5 numbers in light grades, between the longitudinal and transverse strands.

PROPERTIES OF WIRE AND SECTIONAL AREA OF FABRICS

Size per W. & M. gauge	Diam. of 1 wire, in.	Sectional area of 1 wire, sq. in.	Weight per lin. ft. of 1 wire, lbs.	Sectional area (sq. in.) of longitudinal wires only in 1 ft. of fabric width when spaced as shown below — 2 in.	3 in.	4 in.	5 in.	6 in.

Spacing of Longitudinal Wires—The longitudinal wires may be spaced on centers of 2 in., or more in steps of 1 in. The distance between centers of outside longitudinal wires can not exceed 100 in.

Spacing of Transverse Wires—The transverse wires can be spaced on centers of 2 to 10 in., inclusive, in steps of 1 in., and on centers of 10 to 18 in., inclusive, in steps of 2 in. They must project at least ½ in. beyond the outside longitudinals and may, if required, be extended to a maximum length of 102 in.

Rolls and Sheets—Special lengths of rolls or sheets, as may be required, can be made to order. Rolls may be of any desired length not exceeding 400 ft. in the light grades, depending upon the weight and convenience in handling. Sheets should not exceed 20x7½ ft. if shipped in box cars, or 32x8 ft. if shipped on flat cars.

Special Designs in New York, N. Y.

In the city of New York the allowable capacities of floor slabs are no longer based on tested approvals, but may now be determined by a newly devised method of computation which applies to flat slabs of either stone or cinder concrete when cast between steel beams, and only when the span of slab does not exceed 8 ft. For these conditions a minimum thickness of 4 in. is required.

While 4 in. is thus fixed as the minimum thickness of slab, still, a 4-in. thickness may be used on any span up to 8 ft., and for any load which does not exceed the computed capacity of the slab; the actual capacity in any case being determined by the thickness of slab, the conditions of continuity, and the amount and kind of reinforcement used.

Because of the unaccountable strength of short span slabs as shown by actual tests, the city of New York has adopted an empirical formula to be used in designing slabs of 8-ft. span and less when confined between steel beams.

The tables below have been computed by this formula for the conditions of continuous wire mesh reinforcement.

SLAB REINFORCEMENT UNDER NEW YORK, N. Y., CODE

Sectional area of steel reinforcement required, square inches per foot in width, for concrete arches of various spans based on Clinton Electrically Welded Fabric

UNION STEEL PRODUCTS COMPANY

Continuous Chair Stirrups, Reed Soffit Clips, Continuous Sleeper Spacing Anchors

ALBION, MICH.

BRANCH OFFICE: CHICAGO, ILL., 1148 Builders Building—Telephone, Randolph 6635
EASTERN FACTORY, ALBERT OLIVER & SON, 711 East 140th Street, New York, N. Y.—Telephone, Ludlow 2202

Products

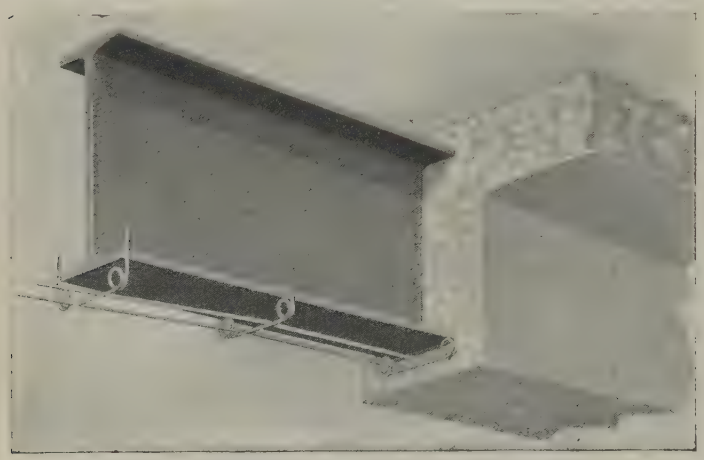
REED SOFFIT CLIPS.
CONTINUOUS SLEEPER SPACING ANCHORS.
CONTINUOUS CHAIR STIRRUPS.

Reed Soffit Clips

Fireproofing reinforcement for steel beams, columns, etc. Welded, pre-spaced and assembled.

Fireproofing around steel beams, girders, channels and columns under best current practice, requires some form of reinforcing clip, uniformly spaced. Reed Clips accomplish this and offer three further advantages:

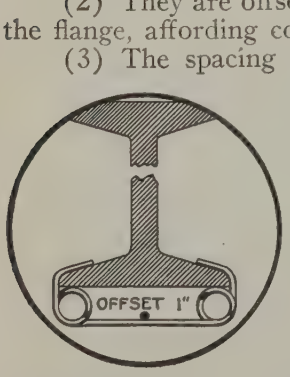
(1) They are welded to continuous spacing strips, and therefore can be quickly placed.



Uniformly Reinforced Beam Soffits

(2) They are offset by the patented loop 1 in. from the flange, affording complete lateral reinforcement.

(3) The spacing strips are offset from the beam providing longitudinal reinforcement.



Clips are spaced 12 in. apart, and made of No. 12 galvanized wire throughout. Manufactured and stocked in 5-ft. lengths; all widths from 3 to 30 in., varying by inches. Projections beyond loop vary from 2½ to 6 in., depending on width.

Specifications—Wrapping for reinforcing concrete fireproofing of all steel column flanges and soffits of all-steel beams, girders and channels to be of welded wire type, constructed so reinforcing wires are offset 1 in. from face of flange and firmly clamped to steel members, such as the Reed Clips made by UNION STEEL PRODUCTS COMPANY, Albion, Mich., and ALBERT OLIVER & SON, 711 East 140th Street, Bronx, N. Y., or similar construction.

Continuous Chair Stirrups

Concrete beam and joist reinforcement. Pre-spaced, shop assembled, welded stirrup units.

Individual stirrups exactly spaced are held rigidly in assembly by three longitudinal wires welded at each intersection. Chairs and side spacers are welded on end and center stirrups of each unit. Made of new billet steel only.

Steel setters place these stirrups in forms ten times as fast as setting single stirrups. No chairs required. No shifting when concrete is poured. Hand wiring to reinforcing rods practically eliminated.

Made in accordance with the framing plans and reinforcing steel schedules in any length, width, depth or spacing. Correct number of stirrups and exact spacing assured.

Setting 13 Joist Stirrups in Form in One Operation

Specifications—Beams and joist stirrups to be pre-spaced and welded to gether in a complete unit, with chairs and stirrup spacer incorporated in stirrups, of size, type and spacings as called for on plans, and as made by UNION STEEL PRODUCTS COMPANY, Albion, Mich., or similar construction.

Continuous Sleeper Spacing Anchors

Sleeper anchors, pre-spaced on longitudinal grouping member. Shop assembled units.

Non-tangling design provides units easily handled and placed with maximum saving of time. No measuring nor templates needed. Correct spacing assured. The long rod lies flush with the surface, anchor loops embedded in the concrete. The sleeper is placed in the cradle between each pair of anchors, and loops are bent vertical against the sleeper with an ordinary claw hammer. With the same tool nails are driven through eyes of the anchors into the sleeper.

Specifications—Sleeper anchors to be of group type composed of several pre-spaced wire clips rigidly connected together, of size and spacing as called for on plans and as made by UNION STEEL PRODUCTS COMPANY, Albion, Mich., and ALBERT OLIVER & SON, New York, N. Y.

Showing Complete Operation with Union Continuous Sleeper Anchors

ACKERMAN-JOHNSON CO.

Expansive Screw Anchors, Expansion Bolts, Concrete Inserts

625 West Jackson Boulevard
CHICAGO, ILL.

Products

ACKERMAN-JOHNSON EXPANSIVE SCREW ANCHOR; EXPANSION BOLTS; CONCRETE INSERTS. U. S. Patents: April 27, 1915, December 21, 1915, April 4, 1916, May 14, 1918; others pending. Patented in Canada, Great Britain, France, Belgium; others pending.

Ackerman-Johnson Expansive Screw Anchor

Adaptability—For attaching objects to hard materials, as concrete, brick, stone, tile, marble, etc.

Description and Operation—Consists of a doubly tapered internally threaded cone made of brass, iron or steel (Fig. 1), within a lead composition ductile sleeve (Fig. 2). These are assembled at the factory, the sleeve being forced on the cone to a normal position as at Fig. 3.

Fig. 1

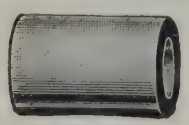


Fig. 2

Fig. 3

Ackerman-Johnson Expansive Screw Anchor

When installed as illustrated, the sleeve is driven farther toward base of the cone and is expanded generally to any degree required to swedge tightly against the sides of hole, effecting perfect holding contact throughout the length and circumference of the anchor. Thus consolidated with the wall material, the anchor provides a machine threaded hole the same as an ordinary tapped hole in a machine part. Any object may then be attached with a standard screw or bolt of suitable diameter.

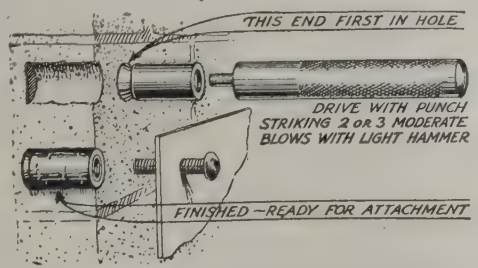

Fig. 4. Manner of Installing Anchor
The piloted setting punch supplied without charge with all anchors

The heavier the load attached, the more forcible becomes the expansion, causing the anchor to resist effort to pull it out far beyond the tensile strength of any screw or bolt.

Distinctive Advantages—Time saving through the use of Ackerman-Johnson anchors compared with old methods more than compensates their total cost.

They save much of drilling cost, requiring least depth for any stated load. They are installed instantly, without the aid of the screw, and before the fixture is lifted into position to be fastened. Their margin of safety is equal to that of steel bolts of correlating size.

They necessitate the least displacement of wall material and consequently less injury to buildings. They effect the neatest possible workmanship.

Sizes—The size of anchor is designated as the size of the bolt or screw to be used. Example: For No. 10-24 screw, use No. 10-24 anchor; for ⅜-in. bolts use ⅜-in. anchor.

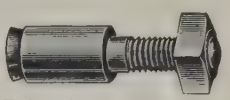
SIZES, EXPANSIVE SCREW ANCHORS

Screw or bolt size, in.	Threads per in.	Minimum dimension of holes required, in.		Specify anchor Size No.
		Diam.	Depth	
6	32	¼	⅜	6-32
8	32	5/16	½	8-32
10	24	⅜	5/8	10-24
12	24	7/16	¾	12-24
¼	20	½	⅞	¼-20
5/16	18	5/8	1	5/16-18
⅜	16	¾	1¼	⅜-16
7/16	14	⅞	1½	7/16-14
½	13	⅞	1½	½-13
5/8	11	1⅛	2	5/8-11

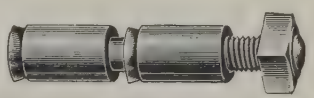
Packed 50 or 100 in box.

Stud Type Expansion Bolts

So great is the holding power of this anchorage, that when set in strong stone or concrete with only its one primary sleeve expanded, the bolt shank can be pulled in two, without the anchorage yielding.



Bolt with Primary Expansive Sleeve Only



Bolt with Primary and One Secondary Expansive Unit

Secondary Expansive Units—Made up of an expansive sleeve and a slip steel cone, giving additional anchorage equal to the primary unit. Calculate the minimum depth of holes for setting at twice the diameter of hole drilled.

Concrete Inserts

Ackerman-Johnson concrete inserts for moulding into the concrete when poured, afford minimum displacement of the concrete and maximum speed in setting. Can be furnished for all sizes of screws and bolts up to ⅝-in. diameter.

We invite requests for full information concerning inserts.

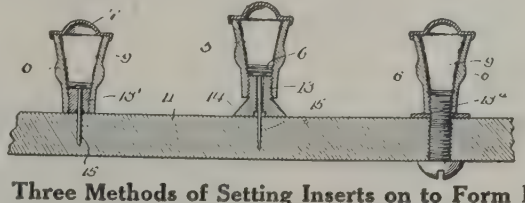

Fig. 6. Three Methods of Setting Inserts on to Form Lumber

Users of Ackerman-Johnson Products

Extensively adopted by leading contractors, manufacturers, railroads, shipyards, government departments and public utility companies.

ANKYRA MANUFACTURING CO.

Manufacturers of Expansion Bolts

149 Berkley Street, Wayne Junction
PHILADELPHIA, PA.

Product

ANKYRA ANKOR (Expansion) BOLTS.

TRADE-MARK
(Reg. U. S. Pat. Off.)

Purpose

To provide a means of holding fixtures to *any* wall, whether hollow or solid, and so holding them that they shall never come loose.

Uses

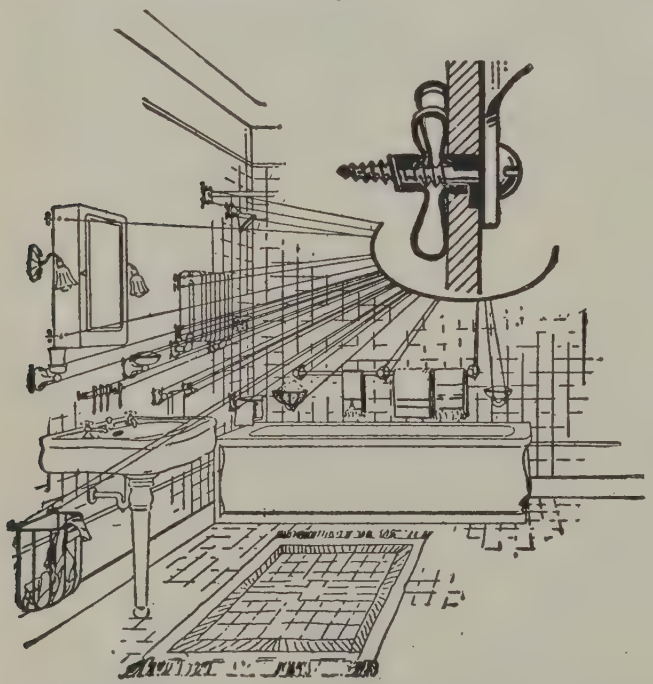
The uses for Ankyra Ankor Bolts are too many to permit of more than a description of typical cases.

Ankyra Ankor Bolts will fasten fixtures to lath and plaster, hollow tile, glazed tile, expanded metal lath, compoboard, sheet metal, brick or concrete walls—in fact they may be used in any sort of wall with assurance that the fixture will "stay put," and yet that it may be removed and replaced at will, if alterations or renewals are necessary.

The illustrations show some uses; but a booklet giving detailed information will be mailed on request.

Other Advantages

Unlike wooden or lead plugs which are prone to loosen quickly because they dry out or are so soft that the threads wear out rapidly, Ankyra Ankor Bolts remain in the wall—rivet themselves in it—and, being made of steel, last indefinitely.



ANKYRA BOLTS USED FOR HOLDING FIXTURES IN BATHROOM

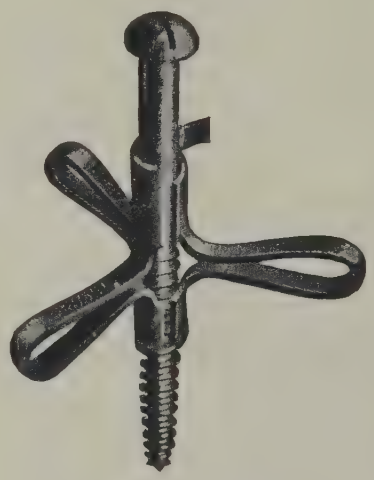
Tests show that Ankyra Ankor Bolts will support a greater load than can be carried on any hollow wall regularly used on standard construction.

(1) The Ankyra sleeve is a self-riveting wing nut.

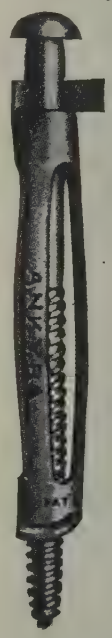
(2) Ankyras can be installed so quickly that the labor and time saved is an exceedingly important factor. Contractors and plumbers have reported that they saved as much as 90% over ordinary methods.

(3) Ankyras obviate the necessity of sounding for studding or making previous provision during construction for the location of fixtures.

(4) The fixture may be removed by taking out screw, but Ankyra nut will not drop down inside of wall as it is an integral part of sleeve or bolt.



ANKYRA BOLT EXPANDED
Note wood screw
Self-riveting; self-adjusting



ANKYRA BOLT WITH
WOOD SCREW
BEFORE EXPANSION

(5) Ordinary standard wood screws are used with Ankyra and may be selected to match other hardware.

(6) Ankyras will hold until the wall itself gives way.

(7) The alignment of grounds can be controlled regardless of irregularities in the face of the wall.

(8) Ankyras are easily and quickly installed.

(9) The solution to many especially vexing problems.

Fastening wall radiators to nearly any kind of wall, but more particularly to tile walls, is usually a ticklish proposition. Ankyras hold the radiator hooks firmly to any kind of wall and are easy to install, as well as permanent.

Bathroom fixtures—especially in public places—break loose with annoying and expensive frequency. The remedy lies in Ankyras which not only hold permanently, but can be used without fear of cracking or breaking the tile.

Manufacturers of Concrete Hanger Inserts

4021 Burwood Avenue

SOUTH NORWOOD, OHIO

Products

HINGE TYPE CAST IRON INSERT.
ADJUSTABLE CONCRETE HANGER INSERT.
CAST IRON INSERT, D TYPE HANGER.

Hinge Type Cast Iron Insert

The Hinge Type Insert differs from other types of inserts in that *it leaves no hole exposed in the ceiling.*

The housing is made with a thin layer of cast iron on the bottom, which is easily broken out for the insertion of the steel plates and bolt head or can be supplied with this layer removed. This insert is made for shafting hangers using ⅜, ½, ⅝ and ¾-in. bolts. Plates 1-D take care of ¾ and ⅜-in. bolts; plates 2-D, ½ and ⅝-in. bolts. The housing is made to prevent bolts from turning when tightening nuts. After being inserted the bolt and plates cannot be jarred out.

This makes one of the strongest types of hangers due to the sturdy, durable construction of the plates and fitting snugly into the housing with the bolt head pulling down on all sides.

Adjustable Concrete Hanger Inserts

These hanger inserts are ideal for automatic sprinkler equipment, heating and plumbing work. They permit both lateral and vertical adjustments, but cannot shift unless readjusted by hand.

This insert is made with two housings:

No. 1 Housing—Used for large sized pipe. Plates can be tapped from ⅛ to ⅞-in. machine threads or ⅛ to ¾-in. pipe threads.

No. 2 Housing—Used for small pipes, air ducts, electric conduits or partitions. Three lines of pipe can be attached to this housing. Plate ⅜ is tapped for ⅜-in. machine threads and is made of malleable iron.

Plates—Are made in the following sizes:

1-A—Tapped ⅜, $\frac{7}{16}$, ½, ⅝-in. standard machine threads.

1-B—Made for ⅜ and $\frac{7}{16}$-in. bolt heads.

2-A—Tapped ⅛, ⅜, $\frac{7}{16}$, ½, ⅝-in. standard machine threads.

2-B—Tapped ⅛, ¼, ⅜-in. pipe threads.

5-A—Tapped ¾ and ⅞-in. standard machine threads.

5-A—Tapped ½ and ¾-in. pipe threads.

Cast Iron Inserts, D Type Hanger

This type is used for all kinds of pipe work and machinery. It is fastened to forms with nails, screws or bolts. These hangers are tapped for ⅜, ½, ⅝, ¾ and ⅞-in. standard machine threads and ¼, ⅜, ½ and ¾-in. pipe threads.

Adjustable Concrete Hanger Insert

KOHLER DIE & SPECIALTY CO.

Concrete Inserts, Steel Bridging, and Metal Specialties

DEKALB, ILL.

CHICAGO REPRESENTATIVE: W. L. Harrison, 1148 Builders Building

Products

Adjustable or Slotted Concrete Inserts, Loop Type and Stem Type; Threaded Concrete Inserts, Cast Type and Pressed Steel Type; Continuous Steel Bridging.

Adjustable or Slotted Inserts

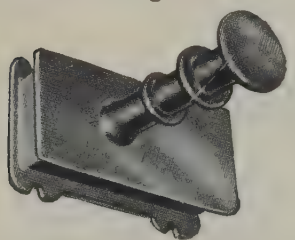
Loop Type

Loop Type—The loop type adjustable insert, intended for use in thin slab construction, is proving more popular now than the stem type and is meeting every requirement. It is one of the best designed and most practical inserts on the market. This insert is so formed that the concrete flows freely around it. There are no sharp corners and in the finished work less surface is exposed in the ceiling after the forms are removed than with any other type which is a very desirable feature. The size of the chamber in both the loop type and stem type permits of the use of either the nut or the head of the bolt.

Prong Type—The loop type insert is also made with prongs projecting approximately ¾ in. on the front and also on the back of the loop for the purpose of securing additional anchorage in the concrete. This type was designed principally for supporting shelf angles and is proving popular and satisfactory in every detail. It is also exceedingly valuable in ceiling work in those places where unusual strength is required.

Prices and discounts on the prong type adjustable inserts will be quoted on application.

Stem Type—Made with a corrugated stem that extends up into the compression area of the concrete, the correct place to hang the load. The tapering ribbed base is so shaped that it gives the greatest possible supporting strength to the concrete member. The greater the load on the Collings insert the tighter the concrete grips and holds.



Note Corrugated Stem and Tapering Base with Flange at Top

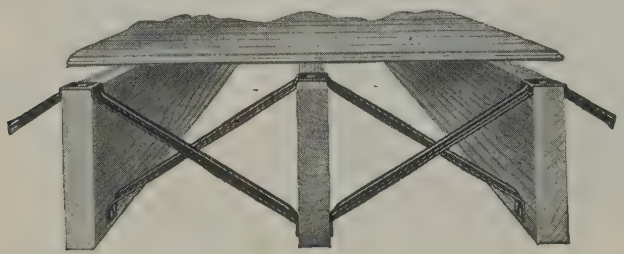
JH Continuous Steel Bridging

A new type of steel bridging that offers a simple yet scientific system for producing a safe, rigid, and permanent floor bridging with real economy. Its construction is such as to make it both a tension as well as a compression bridging.

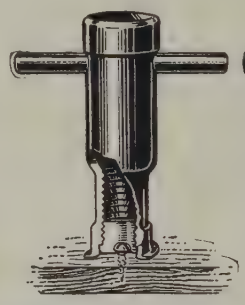
Write for circular and full information of this bridging system that meets every modern building requirement and is necessary wherever wood joists are used.



Kohler Threaded Concrete Inserts

Advantages—The Kohler Threaded Concrete Inserts are now supplied either with the screw point or with nailing lugs at the base for use in place of the screw points, as illustrated.

Pressed Steel Insert
Construction of ⅜ and ½-in. sizes



Steel Insert in Form, with Screw Point in Place
Construction of ⅝-in. size

Insert without Screw
Construction of ⅝-in. size

This screw point makes it possible to set the insert accurately and quickly in the form. A blow with a hammer and a couple of turns with the hand sets this screw down so that the insert is held secure in a vertical position ready for the concrete to be poured. After the work is finished the forms are easily pulled away from the screws, which are then quickly removed, leaving the insert free for the threaded bolt.

Cast Insert with Screw Point

Exact Size of Screw Point Used in ⅝-in. Insert
(Patented Feb. 27, 1912)

Cast Insert with Nailing Lugs

The cast threaded inserts with the nailing lugs at the base are preferred in many places instead of the screw points. They are quickly set and the cost is less.

Economy—These inserts, regularly spaced in the ceilings, floors or walls of reinforced concrete buildings mean a saving of time and heavy expense in attaching or rearranging shafting, piping or other interior equipment. A necessity in concrete construction.

RAIL-TRUING INSERT CO.

Insurance Exchange Building, DETROIT, MICH.

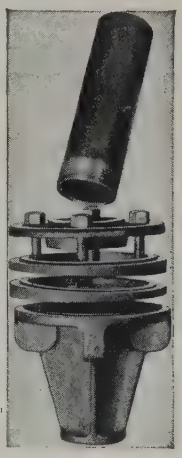
Product

RAIL-TRU INSERTS for anchoring pipe rails to concrete.

Rail-Tru Inserts

Concrete forms ordinarily warp and any insert attached to the form for location is thrown out of true. With the insert out of true, it is impossible to make railing line up without shims. Rail-Tru Inserts solve the problem of anchoring pipe railing in concrete securely and in a vertical position. The turning of one or both of the beveled adjustment rings before or after the rail is in place causes the pipe railing to immediately assume a vertical position.

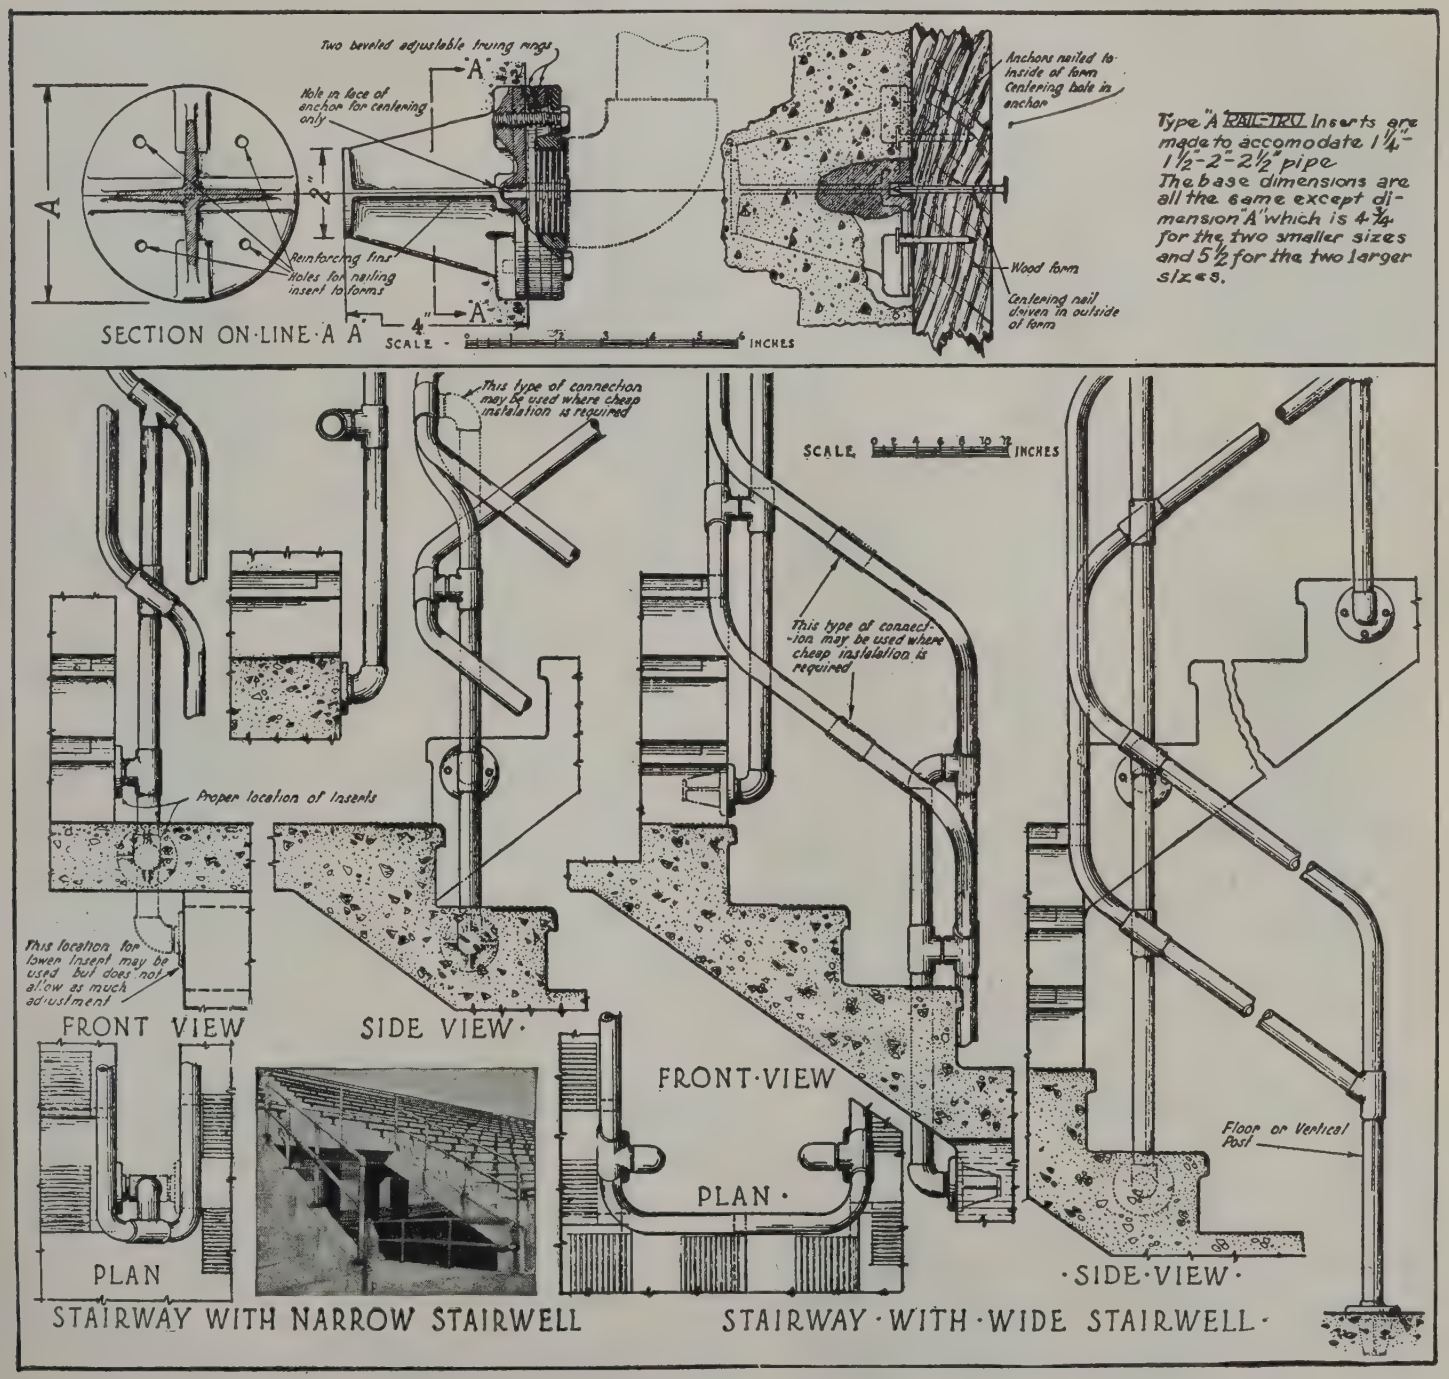
Rail-Tru Inserts are self-centering—cutting of forms is unnecessary. Center point is located by driving a nail through the form. The nail fits into the centering hole in the face of the insert which can then be "back-nailed" to the form. Rail-Tru Inserts do away with the need of shims which work out, expansion bolts which do not always hold the flanges securely, and pipe sleeve calking which is very uncertain at best. Once placed, Rail-Tru Inserts are shockproof; as solid as the concrete itself, because they are anchored.



Rail-Tru Insert Assembly

Specifications

Railing supports for all concrete stairs, ramps, platforms, area and retaining walls or wherever shown, shall be anchored with Rail-Tru adjustable self-centering inserts, as manufactured by the RAIL-TRUING INSERT CO., Detroit, Mich. All inserts shall have approved means of adjusting to true vertical position. The use of split pipe, sleeves and other devices requiring expansion bolts, shims or calking for anchoring and plumbing rail supports shall not be permitted.



Detail of Rail-Tru Insert, Adjustable and Self-centering (Patented)

SECURITY INSERT COMPANY

Ceiling Sockets for Concrete Work

145 West Oxford Street
PHILADELPHIA, PA.

Product

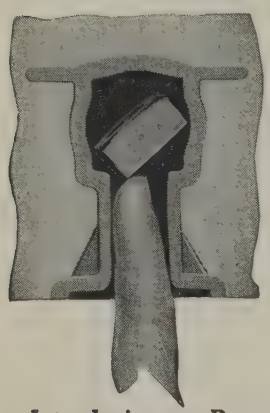
THE SECURITY INSERT, or CEILING SOCKET, for Concrete Work.

The Security Insert

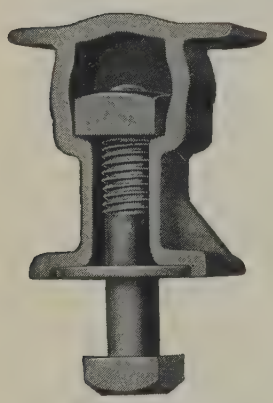
The Security Insert solves in a practical way the problem of the hanging of machinery or fixtures from the ceilings or walls of factories, warehouses and other buildings of concrete construction.

Its design is the result of most careful and exhaustive study. The practicability of the Security Insert is proven because it is being specified repeatedly.

The illustrations show the ease of installation and many other commendable features of this socket, such as the absence of any fixed thread, the ease and flexibility of placement of bolt and nut, the strength of design, maximum grip in the concrete, etc.



Introducing or Removing Nut



Bolt and Nut in Position

Eleven Reasons for Specifying the Security Insert

The design, construction, and application of the Security Insert embody many superior features of which the following are the most important:

(1) The sturdy design of the Security Insert enables it to carry, with a factor of safety, the safe load of the bolt.

(2) The nut being placed up in the concrete, the strain is not entirely dependent on the casting, but is reinforced by the concrete itself.

(3) It has no fixed thread to become rusty or damaged.

(4) In place of fixed thread a standard steel nut (the strongest thread possible) is placed in the insert when ready to use.

(5) This nut is renewable at any time.

(6) A stud or a bolt may be used, whichever is more convenient for the work.

(7) The Security Insert may be nailed to the form, thus avoiding waste of time and lumber, and the large flat base assures its remaining upright during pouring.

(8) A unique and convenient way to install the Security Insert is the use of a machine cut wood block as shown in the illustration. This block fits into the rectangular shank of the insert which is merely set down over it. With this method there are no nails left protruding from the ceiling to be clipped off. The resultant savings reduce the cost per insert set in place.

(9) It is desirable to place inserts in all parts of concrete buildings, even offices, storerooms, etc., for they provide easy means for fastening partitions, etc. A unique and exclusive feature of the Security Insert is that the holes may be concealed by means of a cardboard disk which fits the washer recess and can be painted.

(10) Once placed, the Security Insert is always ready for use. There is nothing in the socket to get out of order or deteriorate.

(11) The Security Insert has been found to be the most practical means for providing safe, permanent anchorage for any loads from the lightest partition to the heaviest crane.

Cross Section Showing Machined Wood Block for Setting up Insert

Safety

Above all, the Security Insert is safe. Even with vibrating loads the nut and bolt are secure. Besides, the Security Insert will carry with a factor of safety the safe load of the bolt.

Insert Nailed to Form

Indorsed by Builders Everywhere

Many of the finest industrial buildings in the United States are equipped with Security Inserts.

A list of prominent installations will be sent on request.

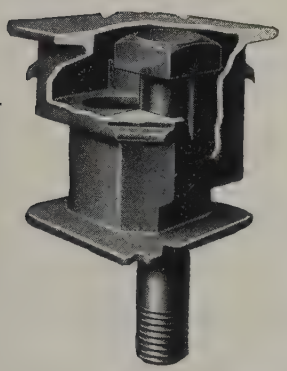
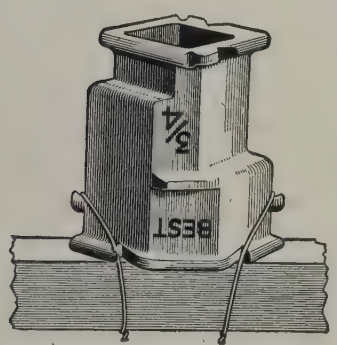
The "Best" Concrete Insert (patented); Barrett Backwater Traps and Dunstan Stench Traps (patented).

Also "Star" Coal Chute (patented), Foundation Gratings; Flue Thimbles; Back Pressure and Bell Trap Floor Drains; Cistern and Coalhole Covers and Rings; Patent Glass Door Fuel Chutes; Stud Sockets; Clean-out Doors; Chimney Caps; Revolving Chimney Tops; Adjustable Ventilators.

Insert Showing Bolt in Position



Insert with Wall Broken Showing Bolt Ready to Be Pushed Over Into the Seat Socket



Insert Showing Method of Attaching to Reinforcing Rod to Hold in Horizontal Position

"Best" Concrete Insert

It is very simple and compact in design; strong and rigid in construction and one of the quickest in action (placing or removing bolt) on the market. To place bolt in insert, bolt is held in vertical position. In an instant with a slight hook motion, the head or nut of the bolt is seated in a wrench-shaped socket. (See illustration.)

Design—The design of the "Best" Concrete Insert permits either the head of the bolt or the nut to be placed in the insert, the wrench-shaped socket being large enough to take the nut, but small enough to give a "viselike" grip to the head of the bolt. The form and depth of the seat socket holds the bolt securely while the nut is being turned on or off.

With this insert there is no possibility of a nut becoming rusted in or the thread being "jimmed" so that the bolt cannot be taken out of the insert.

Ordinarily, it is better practice to put the head of the bolt in the insert and allow the nut to be on the outside where it can be seen and can be tightened if it works loose.

Dunstan Patented Stench Traps

Designed for use in all places where surface traps are required to prevent the escape of foul odors and poisonous gases from the sewer. The different styles are constructed to meet the different requirements of cellars, stables, laundries, etc. All stock traps are made of good cast iron of suitable thickness with heavier flanges and grates for additional strength.

The trap consists of three pieces—body, grate and sealing bowl. The sealing bowl rests on three ribs in the body and may be very easily lifted out and cleaned. The grate is made with a cone which extends into the sealing bowl sufficiently deep to make a perfect seal. The external flange of the grate rests evenly and firmly on the bottom of the top seal in body which is also a water seal.

Style "A"—Is made for cementing in bell of 4-in. sewer pipe. It is used in shallow places where other traps could not be used.

Top flange, in.	Height, in.	Outlet, in.
8½x8½	4	4

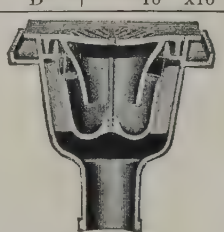
Style "B"—Is made with side outlet and is especially designed for places where there is little fall to the main sewer and the drain either comes in at the side or near floor. The nozzle is sufficiently long to allow for calking into soil pipe or for cementing into sewer pipe.

Top flange, in.	Height, in.	Outlet, in.
8½x 8½	5½	2
8½x 8½	5½	3
11 x11	7	4

Styles "C" and "D"—Style C has a standard size long nozzle for calking in iron soil pipe. 2-in. trap with round flange is often used in hotel sinks. 4-in. trap is largely used in basements.

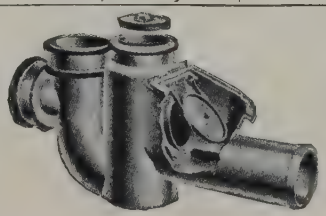
Style D, for lower floor, is a large heavy trap with full size nozzle and ample grate area for handling large quantities of water.

Size	Top flange, in.	Height, in.	Outlet, in.
C	8½x 8½	7½	2
C	11 x11	9½	4
D	14 x14	12½	4
D	16 x16	14½	6



Style "E"—Style E, for upper floors, is the same as Style D, except that it is provided with an extra lower flange to prevent water leaking through the ceiling, and is made especially for upper cement and asphalt floors.

Flange, in.	Height, in.	Outlet, in.
Top, 12x12 } Lower, 15x15 }	12½	4
Top, 15x15 } Lower, 17x17 }	14	6



Barrett Backwater Trap

This is a plain cast iron, accessible backwater trap with brass gate valve made for pipe with diameters 4, 5, 6, 8 and 10 in.

Products

Manufacturers of EXPANSION BOLTS and other Anchorage Devices, of all kinds, together with the necessary drills and tools for placing or replacing.

Dryvin Expansion Shields

The Dryvin is an expansion shield of a new design. It is made of hot dip galvanized steel with a flanged top to hold the work, and flanged bottom to hold the soft metal wrap or expansion member. Hot dip galvanized nails of the correct size are furnished with all shields. The top flange carries the load, the nail merely expands the metal.

A hole of the same size as the Dryvin to be used is first drilled in the concrete, brick or stone. The fixture to be erected is placed in position and the Dryvin inserted in the hole. A nail is then dropped into the Dryvin and is driven home by a few light taps of a hammer. This expands the soft metal wrap, bonding it into every irregularity of the hole, and at the same time locks the lower flange into the hole, making it impossible for the shield to turn or work loose. The hammer taps should be as light as possible so that the lead will have an opportunity to flow and completely fill the hole.

Advantages—There are several advantages and much is saved in the use of Dryvins. The cost amounts to an average saving of 30%; the ease of drilling saves 25%; time saved in installation amounts to between 40 and 50%. Although fastenings made with Dryvins withstand tremendous pull, the shields may be easily removed when desired with a special extractor tool made by the manufacturer, or with a carpenter's claw hammer. By this means the nail is drawn out and Dryvin removed.

Uses—Because of the advantages, convenience and inexpensiveness, Dryvins are used extensively by electrical, plumbing and building contractors, public service corporations, industrial plants, telephone companies, etc.

†Figured with factor of safety in accordance with modern engineering practice.

Tampin Expansion Shields

This shield has three component parts assembled into a single unit: a conical nut with two projecting fins, a special alloy lead sleeve, and a brass plated steel split ring. A machine screw or bolt is used to fasten the fixture to the shield.

The two fins on the nut prevent it from turning in the lead when tightening the bolt. The special alloy lead of the sleeve, when expanded, enters all irregularities of the hole and will not yield under a heavy load. The split ring, an exclusive feature, easily passes over the end of the nut, forcing the lead down the cone toward the bottom of the hole where the expansion should be and is the greatest. This also insures uniform radial expansion on the cylindrical part of the nut.

A hole of proper size is first drilled in the masonry. The Tampin is then placed on the pilot of a spring Tampin setting tool and inserted in the hole, with the conical nut at the bottom. A few light hammer blows on the Tampin tool will expand the shield in its permanent position. The fixture is then placed and the bolt inserted and turned down. The bolt does not expand the shield; it merely holds the fixture in place. The pilot of the Tampin tool passes clear through the shield and is held there by a spring during the expansion. Prevents dust from entering threads and gives clear passage for the bolt to the bottom of the hole. It recedes in the handle of the Tampin tool while the shield is being driven down in place.

TAMPIN EXPANSION SHIELDS

Size of bolt or screw	Min. dim. of hole req'd., in.		*Working load, lb.	†Ship. wt., lb. per 100
	Diam.	Depth

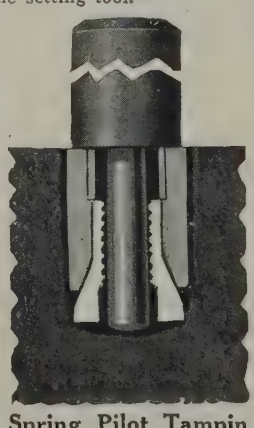
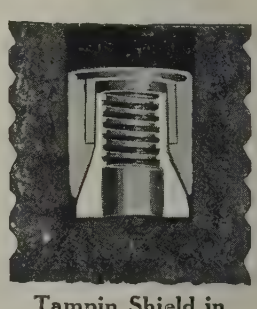
Tampin Expansion Shield



Spring Pilot Tampin Tool Ready to Expand Tampin Shield



Tampin Shield in Position After Expansion

Continued on next page

Loxin Expansion Shields

Hot galvanized, single machine bolt type. Designed to hold in loose as well as tight holes. As the bolt is turned down, the expansion segments at the bottom expand. This brings the grip at the bottom of the hole which prevents slipping. Loxin shields carry a great load and are easy to install.

LOXIN EXPANSION SHIELDS

Bolt diam., in.	Shield length, in.	Outside diam. and drill req'd., in.	Ship. wt., lb. per 100

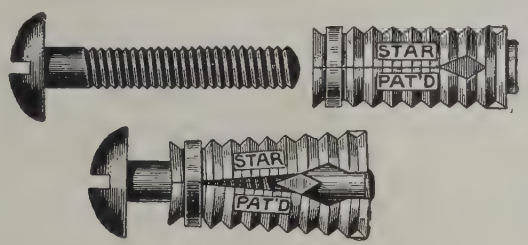
½	2½	7/8	18
5/8	2½	1	24
5/8	3	1	26
¾	3½	1⅛	37

Star Malleable Iron Chair Shields

Simple in operation as may be seen in the illustration. The two shield units are held firmly together at one end by a ring, forming virtually one piece of metal. They will stand almost unlimited rough treatment without parting. Should concrete around shield crush, fastening can be made secure again by tightening expansion with screwdriver or wrench.

Made ¼-in. size only. Especially suited for theater seats.



Scruin Lead Screw Anchors

These are anchors of a new design which give greater holding power and require a smaller installation hole for the corresponding size screw. Each size anchor accommodates more sizes of screws than other types of anchors. The holding power in average conditions of masonry is higher in the short length for Nos. 8 and 14 sizes, but in the case of plaster wall or other soft surfaced masonry, the use of the long length is recommended.

SCRUIN LEAD SCREW ANCHORS

*Screw size and length of anchor	Fractional screw size, in.	Outside diam. and drill req'd., in.	Ship. wt., lb. per 100
6, 8, 10 x ¾	1/8-3/16	¼	1¾

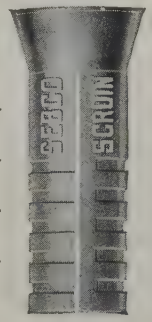
*Order by screw number and length of anchor.



Sebco Toggle Bolts

Ideal fastenings for lath, plaster, hollow tile, pressed boards, hollow metal or sheet steel. Channel construction permits toggle head to fold closely over bolt and pass through small hole. The toggle head is set off-center to fall quickly into position. Sebco Toggles bear on extreme ends, which avoids breaking edges of brittle material.

Made in four types: Nos. 1, 3, 5R and 5F. No. 1 is a pinched head toggle in which the head of the bolt is fastened to the toggle head and a nut is used to make the fastening. No. 3 is commonly known as "plumber's toggle." It has a No. 5 head with threaded rod and capnut. No. 5R has a channel shaped head set off-center, and a round headed bolt. No. 5F is the same as No. 5R except that the bolt is flat headed.

All Sebco toggles have National Standard threads, not stove bolt threads.

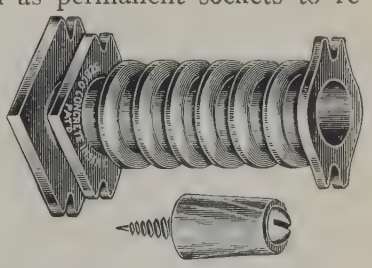
*No. 3 toggles made in three sizes only.

Sebco Concrete Inserts

Here is a practical means of providing threaded holes in concrete walls, ceilings and floors for possible future use. Sebco Concrete Inserts are fastened to the form before concrete is poured. When forms are removed, the inserts remain as permanent sockets to receive standard machine bolts whenever desired.



SEBCO CONCRETE INSERTS

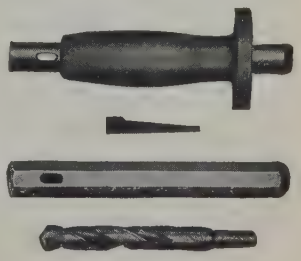
¾	3	55

Hamrtwist Drill Points, Hand Chuck and Holder

These drills are made of special steel alloy to stand hard use in masonry drilling. Furnished in 1/16-in. sizes from 3/16 to ⅝ in. Fast and easy cutting, automatically clean dust from holes, long life, easily resharpened, hold original diameter, will not jam. Hand chuck to fit all drills regularly furnished.

An improved type of drill holder is made with a protecting shield and rubber grip that prevents hitting and stinging the hand. Knockout pin furnished with each holder and chuck.



THE BLASTEEL MANUFACTURING COMPANY

Floor Clips, Floor Joiners and Bindings for Applied Coverings

GENERAL OFFICE
KANSAS CITY, MO.

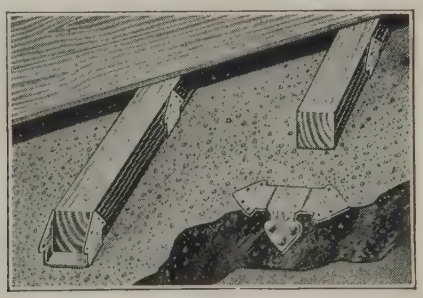
AGENTS IN PRINCIPAL CITIES

Spearpoint Floor Clips

For anchoring wood floors to concrete.

(1) Save cost of material and labor for a concrete fill.

(2) Reduce dead weight 18,000 lb. per 1000 sq. ft. of floor area.



(3) Spearpoint clips are made of 20 gauge rust resisting metal and give an absolutely firm floor. The two shoulders and three bosses on each flange that inserts in the concrete maintain solid and permanent anchorage.

(4) They provide a dry air space which safeguards sleepers and floor from rotting. This space also acts as insulator and sound deadener.

(5) Conduits, pipes, etc., may be placed on top of slab and under finished floor.

(6) Sleepers can be laid approximately twice as fast as when a fill is used.

(7) Spearpoints save time and labor in placing as the spearshaped flanges are easily and quickly inserted in the concrete.

(8) Spearpoints lie flat until the sleepers are to be laid, giving free use of floor slab.

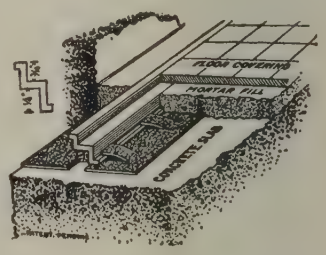
(9) Spearpoints have sufficient width to permit abutting ends of sleepers to join within the clip, leaving no loose ends to warp or squeak.

(10) Spearpoints are made for 2, 3 and 4-in. sleepers. The Spearpoint Standard is used for ordinary floor construction and the Spearpoint Giant for extra heavy requirements.

(11) Economical and easy to set. Simple instructions accompany each shipment.

Recessed Brass Binding Bar

For use where an offset is provided in concrete or terrazzo for linoleum or other applied floor covering in public buildings, schoolrooms, hospitals; in corridors, around elevator mats at floor landings, etc.



By extending a cement or terrazzo border a few inches from the wall in rooms or corridors, the Recessed Brass Binding Bar forms the offset for the applied covering and makes a perfect abutment of the two materials, leaving no opportunity for the collection of germs or dirt and at the same time making an ornamental border for the finished floor.

(1) This bar forms the offset for receiving the applied floor covering.

(2) It makes a close, perfect abutment of the two floor materials on the same level, with an ornamental polished brass strip in evidence.

(3) Gives a straight binding edge for the applied covering.

(4) Protects the border material against chipping or crumbling.

(5) Makes a smooth, level base for the covering that brings its surface even with the top of the bar and outside border.

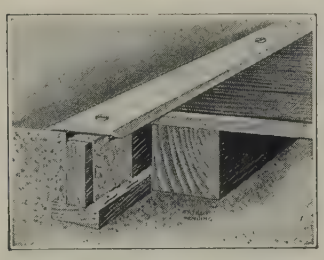
(6) Serves also as a dividing bar between the two fills, preventing cracks from the inside field extending into the border material.

(7) Top of bar serves as a screed for finishing border material to proper level.

(8) Shoulder of bar is also a screed for striking off the inside fill.

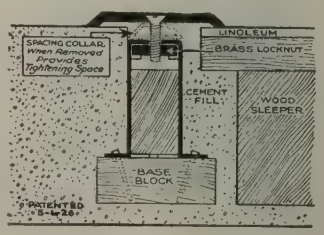
(9) Base plates spaced along the bar support it in an upright position, and give the bars secure anchorage and perfect alignment.

The Recessed Brass Binding Bar is made to accommodate either $\frac{3}{16}$ or $\frac{1}{4}$-in. flooring and 6 m.m. or 4.76 m.m. metric system. Base anchors supplied with bars.



Ankortite Floor Joiner

The Ankortite is a securely anchored and attractive joiner for abutting floors. It consists of a threshold plate attached to an assembled base, within which is provided a tightening space to take up the shrinkage and wear that occurs in floors, and eliminates forever any looseness or rattle of the threshold plate.



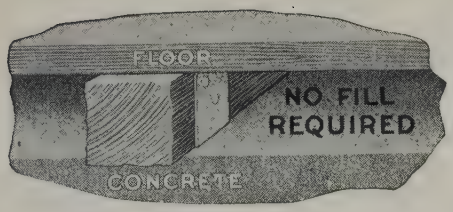
The plate is furnished in brass, bronze or galvanized steel, either arched or flat, in standard widths of $2\frac{1}{4}$ and 3 in., or any desired width may be used. Shipped completely assembled, made up to specified lengths, ready for placing. The Ankortite costs no more than the average threshold plate and is simple and easy to install.

THE BULL DOG FLOOR CLIP CO.

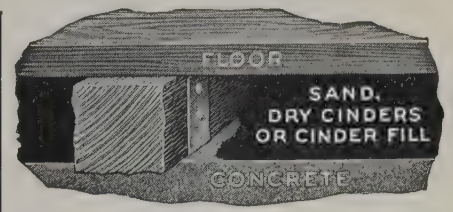
108 North First Avenue, WINTERSET, IOWA

135 BRANCH REPRESENTATIVES AND 20 CONVENIENT DISTRIBUTING PLANTS

LOCAL REPRESENTATIVE



Bull Dog Standard without a Fill



Bull Dog Junior Where Fill Is Required

Product

BULL DOG FLOOR CLIP for anchoring Wood Floors to Concrete.

Advantages of Bull Dog Floor Clips

(1) Save 5¢ per sq. ft. by eliminating the cost of material and labor for a concrete fill.

(2) Can be placed for ½¢ or less each, and sleepers can be laid 50% faster than if anchored by a fill material.

(3) Reduce dead weight 18,000 lb. per 1000 sq. ft. of floor area.

(4) Give a perfectly firm, level floor. Solid bed and anchor overcome all possibility of floor buckling, doming, or squeaking.

(5) Provide a dry air space which prevents strips or finished floor from rotting. No drumhead or hollow sound is produced by this air space.

(6) Permit conduits and pipes to be placed on top of slab right under finished floor.

(7) Where a fill is considered necessary, Bull Dog Floor Clips save considerable in construction costs when used with any standard fill. Use of Bull Dog Junior Clip is recommended for a still greater saving in construction costs.

Bull Dog Junior (*Reg. U. S. Pat. Office*)

For floors where ordinances require a fill, or where a light clip is desired, the Bull Dog Junior effects a still greater saving in anchoring wood floors to concrete. It is one-half the width of the regular Bull Dog Clip and is made in three sizes for 2, 3 and 4-in. sleepers. When the Junior Clip is used in conjunction with a fill, we suggest spacing 16 in. and 2½ ft. which requires about 300 clips per 1000 sq. ft. of slab at a cost, including installation, of $9.00. This cost is more than offset in the time and expense of bracing the strips, beveling and shimming sleepers, and a large saving in expense of fill which can be made of any cheap, inexpensive mix, sand or cinders. Samples of each of the three sizes will be promptly furnished any interested architect or contractor.

Nails Now Furnished without Charge

A sufficient quantity of the correct size nails is packed in each case of Bull Dog Clips shipped. This assures the use of the right size nails and saves the user their cost.

Users of Bull Dog Floor Clips are protected by reissue Patent 15881, July 29, 1924; Process Patent 15387430, May 19, 1925

Manufacturers of BONANZA "CEMENTILE"—a reinforced cement tile roofing.

BONANZA CEMENTILE
TRADE-MARK

Description of Bonanza "Cementile"

Bonanza "Cementile" are very large, light, steel reinforced cement roofing tile furnished in three distinct types; namely, Interlocking, Flat, and Channel, besides such necessary fittings as ridge tile of various types, skylight or glass insert tile, flashing tile, collar tile, etc., all factory made and cured—a specialized product, brought to its highest state of development.

The tile are laid directly on open steel roof purlins (which are spaced on a span suitable for the type of tile selected).

In no case is sheathing or other base support required. This eliminates excessive weight and insures greatest economy in design of the supporting structure.

All in all, Bonanza "Cementile" roofs are roofs of economy and quality, speedily laid, with guaranteed results backed by our established reputation as manufacturing and contracting engineers over a period exceeding 25 years.

Bonanza Interlocking "Cementile" are designed for pitched roofs. Laid directly on purlins spaced approximately 4 ft. apart, they are fireproof and waterproof, the finished surface having a particularly pleasing red Spanish tile effect. Like Bonanza Flat "Cementile" and Bonanza Channel "Cementile" they are very strong and light.

Bonanza Flat and Bonanza Channel "Cementile" are designed for flat roof construction, or for pitched roofs where it is desired to waterproof with composition covering. These tile are laid directly on purlins; the 1½-in. Bonanza Flat "Cementile" for standard spacing of 5 ft., and the Bonanza Channel "Cementile" standard 8-ft. spans, are a combination of tremendous strength and lightness that eliminates all form work and assures speed in erection with positive results.

Advantages of Bonanza "Cementile"

Economy—Being laid directly on the roof purlins, the absence of roof boarding, nailing strips and other forms of fastenings makes the initial cost reasonable. Maintenance charges are eliminated, thus making the first cost usually the last.

Weight—These tile are designed along economical lines, reducing the dead load on the steel structure to a minimum.

Strength—In conformity with the standard purlin spacing, Bonanza "Cementile" roofs will sustain such roof loads as are usually encountered. Breaking load tests made at Columbia University for the New York Building Department, showed as high as 350 lb. per sq. ft. under a uniformly distributed load on the standard spacing.

Adaptability—Bonanza "Cementile" will be found suitable for any type of roof construction and of any size.

Erection—An experienced and capable field force insures absolute satisfaction. "Cementile" roofs can be laid regardless of temperature or climatic conditions, thus eliminating delays.

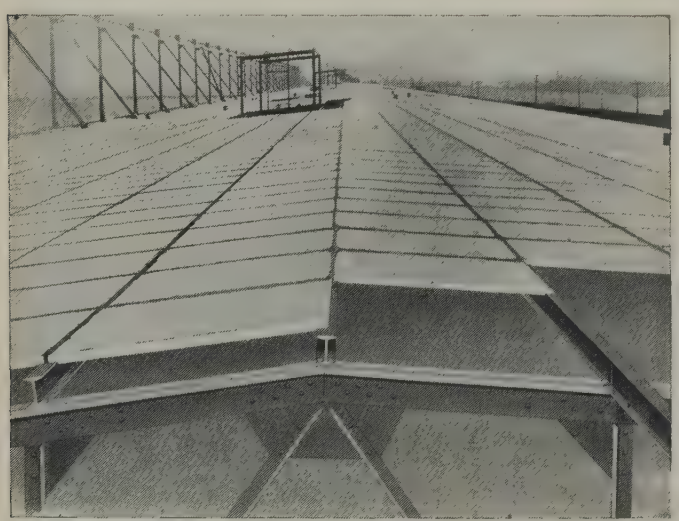
Weatherproof and Fireproof—Bonanza "Cementile" are impervious to water and the elements, are proof against fire, and are everlasting under ordinary conditions.

Interlocking "Cementile"

Designed for pitched roofs, forming in itself a finished, watertight and fireproof covering.

Standard tile is 26 in. wide by 52 in. long (24x48 in. exposed surface) and 1 in. thick, properly reinforced with a galvanized steel fabric. It develops an ultimate breaking load capacity of 350 lb. per sq. ft.

The tile are made up as single units with no loose connections. The side "roll" of one tile overlaps the "rabbet" of the adjacent tile. All joints are properly sealed with "Lastik" Cement. A 4-in. lap is provided on each row of tile by the row above, which is staggered.



Lehigh Valley R. R. Co. Pier Shed, Jersey City, N. J.
110,000 sq. ft. of Bonanza Flat "Cementile" ready for waterproof covering

Watertown Arsenal, Watertown, Mass.
Finished Bonanza Interlocking "Cementile" Roof with Bonanza Glass Insert "Cementile." This is part of a total installation of ten buildings with an area of 470,000 sq. ft.

Continued on next page

The tile are hooked in place on purlin flanges by means of a continuous 1-in. offset at top of each tile. The Bonanza Wire Glass Insert Interlocking "Cementile," which interchange with the standard tile, provide any lighting effect demanded.

Guaranteed to carry a uniformly distributed load of 250 lb. per sq. ft. over a 4-ft. span.

DIMENSIONS AND WEIGHTS OF INTERLOCKING "CEMENTILE"

Size of tile	26x52 in.
Thickness of tile	1 in.
Surface exposed	24x48 in.
Weight per sq. ft.	14 lb.
Weight per sq. ft. of finished roofing	16 lb.
Number of tile per square of roof (100 sq. ft.)	12½

Roof Design—Minimum pitch desirable for slope of roof is ⅕, which is 4⅛ in. to 1 ft.

In order to arrive at the proper purlin spacing always start at the eaves; then use standard spacing of 3 ft. 10 in. to 4 ft. ½ in., as conditions call for. Any short spacing should be placed at the ridge; should this spacing be less than 1 ft. 4 in., special 60-in. tile should be used at the eaves. Steel channel purlins should be provided, held in alignment by sag rods.

Flat "Cementile"

Designed for both flat and pitched roofs; the application of a standard composition roofing is required to make roof watertight.

Standard Bonanza Flat "Cementile" are *1½ in. thick, 24 in. wide, and 60 in. long,* and are always carried in stock for immediate shipment. Where necessary, special tile are made to order for spacing over or under 60 in.

Ends have an offset which is laid on flange of I-beam purlins, after which joints are properly pointed, preparatory to application of composition roofing. Bonanza Flat "Cementile" are properly reinforced.

Guaranteed to carry a uniformly distributed load of 200 lb. per sq. ft. over a span of 5 ft.

DIMENSIONS AND WEIGHTS OF FLAT "CEMENTILE"

Thickness of tile	1½ in.
Size of standard tile	24x60 in.
Surface exposed	24x60 in.
Weight per sq. ft.	17 lb.
Weight per square of roof	1700 lb.

Channel "Cementile"

Designed to meet the demands of the present tendency to use extra wide spans in flat roof construction. Also used extensively on sawtooth roofs.

Standard Bonanza Channel "Cementile" is *18 in. wide and 96 in. long;* channels are 1⅜ in. thick at flanges and 1 in. thick at web. Special tile are made to order for spans over or under 96 in.

Ends are laid directly on flange of I-beam purlins, joints are then properly pointed and entire roof deck covered with some form of composition roofing. Bonanza Channel "Cementile" are properly reinforced.

DIMENSIONS AND WEIGHTS OF CHANNEL "CEMENTILE"

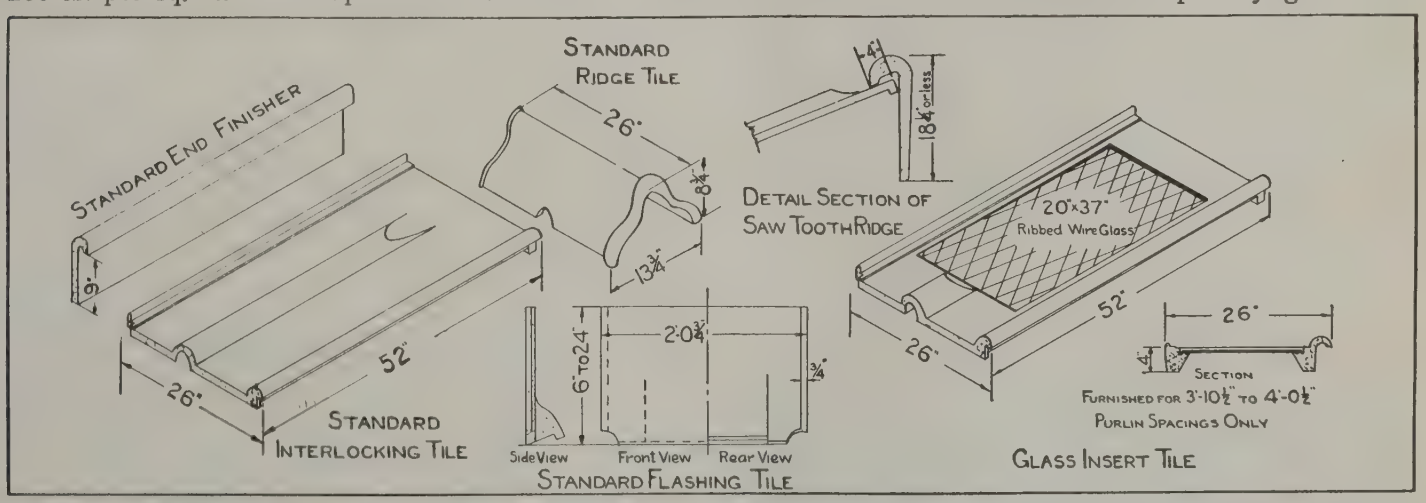
Depth of tile	3½ in.
Thickness of tile	Flanges 1⅜ in., web 1 in.
Size of standard tile	18x96 in.
Surface exposed	18x96 in.
Weight per sq. ft.	19 lb.
Weight per square of roof	1900 lb.

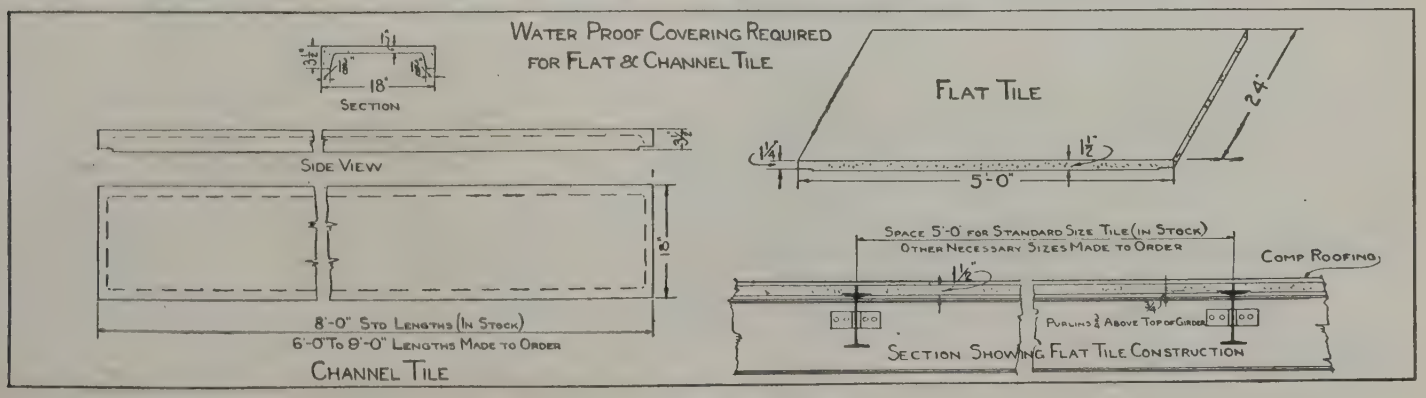
Service

Our engineering department renders free service to owners, engineers, architects and contractors whenever desired. Send your problems and preliminary plans during the early stages of the work. Our experience of 25 years allows us to offer suggestions as to the most economical purlin layout. Upon receipt of preliminary or finished drawings, either approximate or definite proposals will be furnished, as may be desired.

Bonanza "Cementile" roofs are erected preferably by experienced and efficient crews maintained by the company.

All materials and workmanship fully guaranteed.





ANCHOR FIREPROOFING COMPANY

101 Park Avenue
NEW YORK, N. Y.

2210 Park Avenue
DETROIT, MICH.

101 Marietta Street
ATLANTA, GA.

Products and Services

The furnishing and erection complete in the building of:

Afco Reinforced Gypsum Nailing Roof Tile.

Afco Combination Plaster Board Gypsum Roofs.

Afco Suspension System Gypsum Floors and Roofs.

Gypsum Tile Partitions.

Construction Service

All above constructions are installed in the building by our own organization consisting of country-wide crews of mechanics, especially trained in these types of work and available anywhere on short notice. Immediate service, correct and rapid installation are assured.

Engineering Service

A complete engineering department is at your service for consultation and assistance in design and construction. Architects' specification folders covering any of above and giving complete design information, and details will be sent upon request.

Afco Reinforced Gypsum Nailing Tile

Description—Solid precast, lengths of 30 in. by widths of 12 in., thickness of 3 or 4 in., consisting of calcined gypsum and wood fibre reinforced with electrically welded galvanized wire mesh. The wood strips are anchored in the tile and beveled to give additional security. These strips provide a positive nail-holding base to which the slate or ornamental tile may be nailed direct or to wood cross sleepers attached as shown in cut below. We recommend the use of cross sleepers. This tile provides an absolutely positive nailing base even under excessive moisture and circumvents the trouble previously encountered in ordinary types of plain gypsum roof tile, which possesses little nail-holding power when dry and practically none when damp.

Steel Framing—Owing to the light weight of Afco Gypsum Nailing Tile, 16 lb. per sq. ft., a material economy in structural steel framing is permitted.

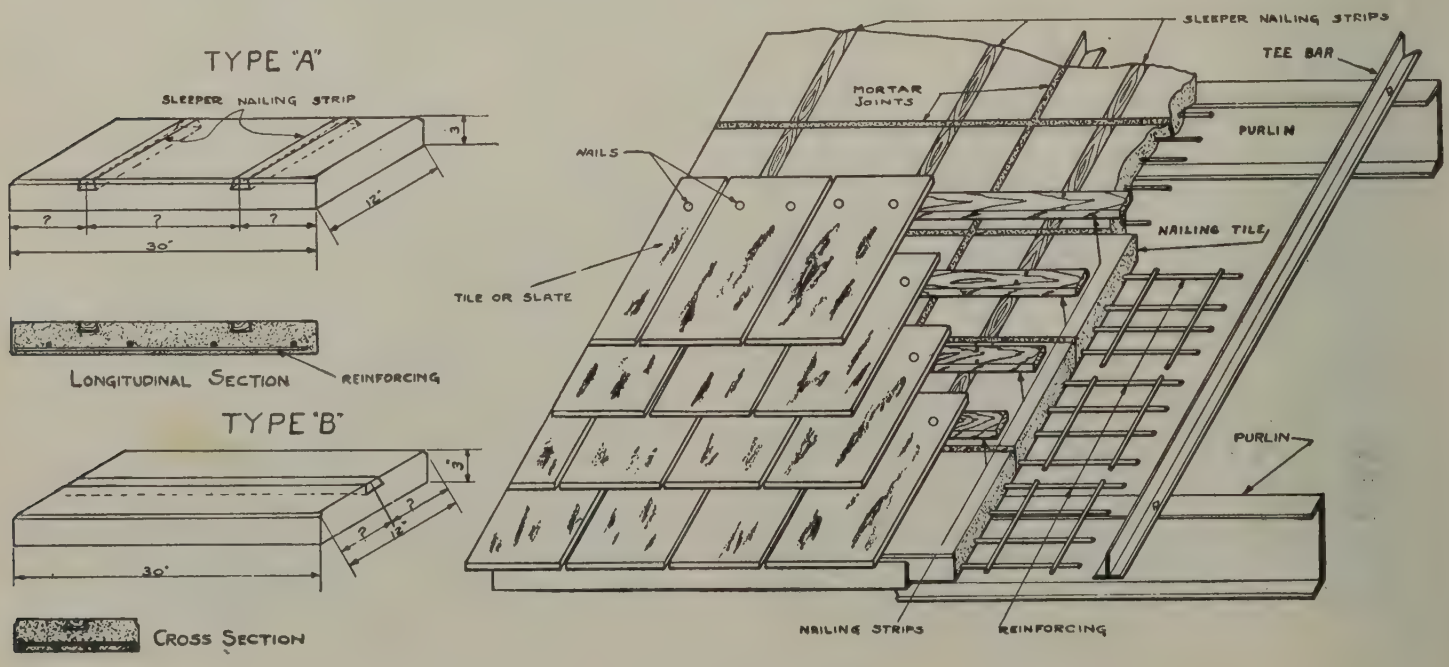
Insulation—Gypsum has the lowest conductivity of any structural fireproof building material, and heat penetration in summer and heat loss in winter are reduced to a minimum.

Strength—The Detroit Testing Laboratory reports show that Afco Nailing Tile develops strength withstanding ultimate uniform loads of from 488 to 520 lb. per sq. ft. or, using the factor of safety of 4, safe working loads of from 122 to 130 lb. per sq. ft.

Specifications—All roofs, as shown on plans, unless otherwise noted, shall be constructed of 3x12x30 in. solid Afco Gypsum Nailing Tile. Tee irons (see schedule for proper sizes) shall be laid directly on and securely fastened to the purlins. Tee irons shall be spaced 30¾ in. on centers and shall be furnished and erected by this contractor. The tile shall be laid tightly together on tee irons without mortar and after placing tile, all joints shall be filled with gypsum mortar mixed in accordance with the manufacturer's specifications. The entire surface shall be left true and even for installation of finish roof covering.

TEE IRONS REQUIRED FOR VARIOUS PURLIN SPANS

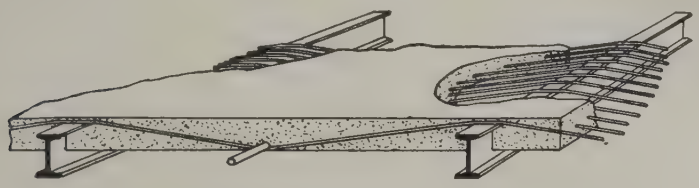
Purlin span	Size of tee	Weight
Up to 5 ft. 3 in.	2¼x2¼x¼ in.	4.1 lb.
5 ft. 3 in. to 6 ft. 0 in.	2¼x2¼x$\frac{5}{16}$ in.	4.9 lb.
6 ft. 0 in. to 6 ft. 6 in.	2½x2½x$\frac{5}{16}$ in.	5.5 lb.
6 ft. 6 in. to 8 ft. 0 in.	3 x3 x$\frac{5}{16}$ in.	6.7 lb.



Continued on next page

Afco Suspension System Gypsum Floors and Roofs

Description—This construction employs a principle of proven value and is practical for any type of building. Load is carried by cables in suspension, gypsum fill being used only to hold the cables rigidly in place. Cable section is constant, variations in purlin spacing and in floor or roof loads being provided for by cable spacing. Compressive strength of gypsum is disregarded and cable stresses are figured by standard formulae.

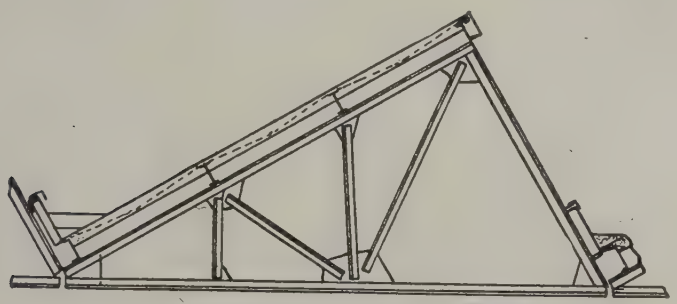


Rapid Erection—Fill sets in 15 minutes and the centering, which is of simple type wood form construction, may be removed within an hour. Other trades follow immediately with their work.

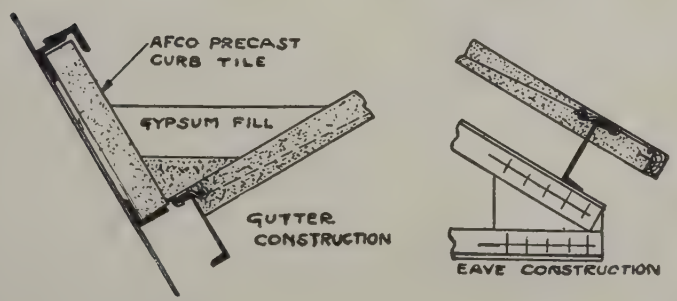
Insulation—Fill, principally calcined gypsum, eliminates condensation on undersurface, provides against heat loss in winter and penetration of heat in summer.

Economy—Light weight permits economy in structural steel, insulation qualities reduce amount of heating equipment required and cost of operating same.

End Bay Bracing—To take cable tension which exerts a pull on the end bay beams, it is necessary to include light truss bracing in structural steel contract. Our architect's folder gives full information—sent on request.



TYPICAL SAWTOOTH CONSTRUCTION



TYPICAL FLOOR CONSTRUCTION

Afco Combination Plaster Board Gypsum Roofs

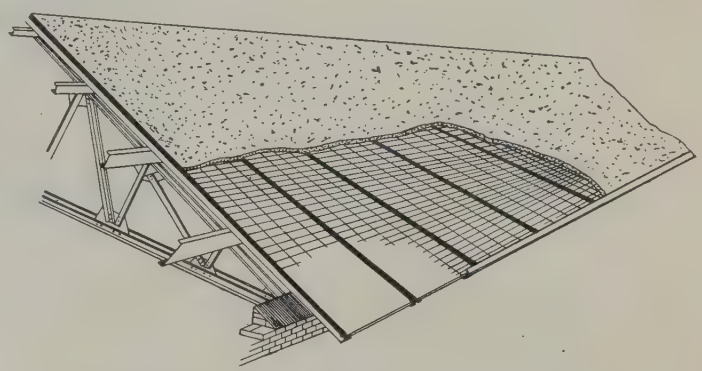
Description—Construction consists of subpurlins, either tee irons or light rail sections, spaced 32½ in. on centers, and clipped to main purlins. Heavy duty ½-in. plaster board is laid on and supported by bottom flanges of rails. Galvanized electrically welded reinforcing mesh of No. 11 main wires on 4-in. centers, and No. 12 spacer wires on 8-in. centers, is laid on top of the plaster board. Fill, consisting of standard gypsum mix, is poured, screeded and troweled to an even surface to receive waterproof covering. It is suitable for roofs with a pitch not greater than 45°.

Economy—This construction makes a definite saving in structural steel, due to its light weight. Insulating value of the roof reduces initial cost of heating equipment and reduces fuel bills.

Appearance—Undersurface presents true and uniform paneled appearance, showing neither form marks nor nailheads, and may be plastered or decorated in any color scheme, if desired.

Rapid Erection—These roof decks can be poured as fast as steel and masonry walls are completed. They set in 15 minutes and finish roof covering may be applied immediately.

Insulation—Same advantages as other roof types on this and preceding page.



Fireproofing—The construction comprises only materials whose fire-resisting qualities have long been established.

Strength—Columbia University tests of Afco Plaster Board Gypsum Decks reveal strengths that afford a factor of safety far in excess of standard practice—this factor of safety being much greater than that of the ordinary design of the structural steel framework of the building.

CERTAIN-TEED GYPSUM REINFORCED ROOF TILE

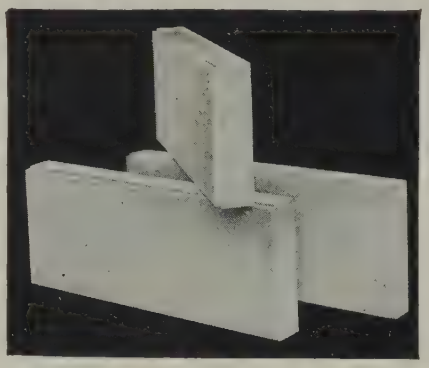
Certain-teed roof tile are made from a special gypsum stucco, reinforced with electrically welded galvanized, steel mats, designed to carry full required roof load. They are precast or factory moulded and therefore assure uniformity in mix, accuracy in size and weight.

Certain-teed roof tile are classed as short span tile. They are made in two sizes, 12 in. wide by 30 in. long and 3 in. thick, solid and 4 in. thick, hollow.

They are cast in a special form to provide a groove for sealing with mortar. *See illustration.*

Certain-teed roof tile can be erected at all seasons of the year. They can be adapted to any architectural design and can be covered with any kind of roofing. They are readily adapted to curved roofs, hip and valley construction and other intricate designs, as they are easily cut to fit.

Due to their high insulating qualities they greatly reduce heat losses, permit savings in cost and maintenance of heating equipment. Due to their insulating properties, they tend to prevent condensation. They are not affected by the action of sulphurous fumes. They are light in weight when compared with other materials used in roof construction.



Certain-teed Gypsum Reinforced Roof Tile

Certain-teed roof tile require sub-purlins, usually tee irons or standard A.S.C.E. light rail sections. The tile are placed on tee iron sub-purlins spaced 30¾ in. on centers or light rails spaced 31¾ in. on centers.

Specifications for Certain-teed Roof Tile

All roofs indicated on the drawings unless otherwise noted shall be constructed of Certain-teed Gypsum Reinforced Solid (or Hollow) Roof Tile, 3 (or 4) in. thick, as manufactured by the CERTAIN-TEED PRODUCTS CORPORATION; laid on sub-purlins (or, light rail sections) of the size and spacing indicated on the drawings.

Installation—All Gypsum Roof Tile shall be placed on supports without mortar with sides closely fitted and ends, bearing not less than ¾ in. on all sub-purlins. All top surface joints only, shall be thoroughly pointed with gypsum mortar composed of one (1) part unfibred gypsum cement plaster and two (2) parts clean, sharp sand. All steel work will be furnished and erected by the steel contractor.

Note: All steel work should be included in the Specifications for Steel Work.

Also Packings for all purposes; Floorings; Refractory Cements and Furnace Linings; Asbestos Wood; Insulating Lumber; Asbestos Products of all kinds.

Transite Corrugated Asbestos

Transite Corrugated Asbestos Roofing and Siding is made of asbestos fibres and portland cement united under great hydraulic pressure into a dense unlaminated monolithic sheet of great strength and rigidity. Transite cannot burn or rust. It will not rot, split, crack, or curl, and is immune to alkali or other corrosive fumes. Paint is not required as a preservative. It can be readily punched, drilled, or sawed, and is fastened with bolts, nails, or screws as required.

Johns-Manville Transite Corrugated Asbestos Roofing and Siding, standard thickness, may be used over purlin spacings up to 48 in. on centers, or over sheathing. The sheets may be laid on any slope from 2 in. per ft. up. Transite Corrugated Asbestos is furnished in sheets 42 in. wide, 4, 5, 6, 7, 8, and 8½ ft. long. One square weighs approximately 510 lb. laid.

The type of fasteners used depends upon the type, shape, size, and position of the purlins or girts. Fasteners are located at the top of the corrugation, and are provided with washers. The head of the fastener is then covered with asbestos roof putty.

Transite Corrugated Roofing and Siding is also furnished in extra heavy thickness for specially wide purlin spacings.

JOHNS-MANVILLE CORPORATION also furnishes Transite Flat in all thicknesses from ⅛ to 2 in. (thicker on special order). Ridge rolls, louvre blades, ventilators, ducts, and special moulded shapes, are also made of Transite.

Johns-Manville Service

Architects are urged to avail themselves of the free service of Johns-Manville's Architects' Service Section and engineers for assistance on all problems. If you do not have a copy of our details and specifications on Transite Asbestos Lumber, write for one.

Fleischman Co. Pier, Peekskill, N. Y., Covered with Transite Corrugated Asbestos Roofing and Siding

FEDERAL CEMENT TILE COMPANY

Precast Concrete Roof Slabs and Cribbing Units

608 South Dearborn Street

CHICAGO, ILL.

Federal Interlocking Tile for Pitched Roofs

Form a complete waterproof roof, entirely eliminating all composition covering.

Their attractive red color enhances the appearance of the building.

Federal Glass Tile

When used in combination with Federal Interlocking Tile for top lighting, these tile form an ideal "daylight roof." Can be so distributed as to admit light over entire floor space, or concentrated on any technical or exacting operation. Glass is embedded in concrete during manufacture in such manner as to prevent cracking of the glass.

Federal Flat and Channel Deck Slabs

Designed for flat and pitched roofs. These types require some form of composition covering. Their light weight and long span effect a structural steel saving, and they eliminate costly labor and materials incidental to roofs poured or plastered on the job.

Federal Cork Insulated Slabs

Afford a splendid super-insulation. The cork is entirely encased on all sides with impervious concrete.

Federal Nailing Concrete Slabs

Form a concrete deck to which can be readily nailed slate, small tile or other ornamental roofing. Made of fireproof and waterproof concrete.

The Roof for Permanence

Federal Tile are made of the most indestructible of all materials—reinforced stone-concrete. They are not affected by heat, cold, ice, snow, fire, water, acid fumes, gases, or any other destructive forces. They actually grow stronger with age. Laid directly on structural steel, they make a light weight, fireproof construction. They require no painting, repairing or other maintenance. They last as long as the structure. The tile are properly reinforced and tied together with wire mesh to carry a load well above the building code requirements of the larger cities. The unit system, with plastic cement at the joints, makes every slab free to come and go with vibration, contraction and expansion. Federal Cement Tile provide the lowest cost permanent roof obtainable today.

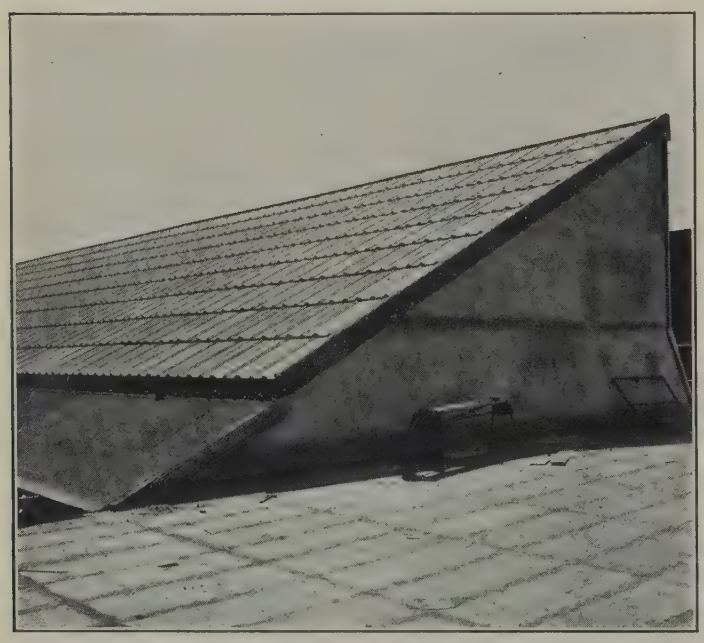
A list of representative installations will be furnished on request.

Service and Structural Details

All Federal roofs are installed and fully guaranteed by the manufacturer. Federal engineers are structural experts and will assist architects and engineers in obtaining the most economical layout of both steel and tile. This service involves no charge or obligation.

Federal 2-Piece Concrete Cribbing

These precast, reinforced concrete units are ideal construction for industrial, highway and railroad retaining walls. They form an attractive, stable wall at exceptionally low cost.



Federal Interlocking and Flat Slabs on Ford Motor Co. Assembly Plant, Memphis, Tenn.

Federal Channel Slabs Forming Roof Deck and Ceiling on Union Station Concourse, Chicago

Standard Specifications

General—All tile to carry approximately 250 lb. per sq. ft. breaking load, uniformly distributed when resting on supports spaced the same as the purlins. No cracked or broken tile or tile with broken corners or warped tile will be permitted to be placed in the roof. All tile to be as nearly perfect as good workmanship will permit.

All tile to be natural water and air cured under cover where a constant temperature is maintained of not less than 65° F.

This contractor shall make up and submit for approval precast slab details based on the steel fabricator's shop drawings as well as the architect's design drawings, before starting manufacture of material.

All tile are to be erected by the manufacturer furnishing the material in a thorough workmanlike manner.

Interlocking Tile—The pitched roof is to be Precast Reinforced Concrete Tile, Interlocking Type, with the necessary trimmings, to make a complete and satisfactory job.

All tile to be composed of an approved brand of portland cement and the highest grade of washed torpedo sand, in a mixture of 1 part of cement to 3 parts of sand accurately graded, thoroughly mixed, and mechanically tamped and kneaded, so as to obtain the greatest possible density and watertightness. Each slab is to be reinforced with a sheet of galvanized cold drawn wire mesh, the longitudinal wires spaced not more than 2 in. apart and cross wires woven around the longitudinal wires.

The sheet of mesh reinforcing shall be mechanically straightened before being placed in the slab so that it can be accurately centered in a plane and be protected by ½ in. of dense, impervious concrete.

The exposed surface of the tile to present a permanent red color and this color, a mixture of iron oxide and cement, to penetrate the top half of the slab. The top surface to be thoroughly troweled, giving same a smooth and uniform finish.

The longitudinal joints to be of plastic made with a high grade oil cement and a weather cap coat of highest grade elastic compound. The joint to conform to detail shown on the drawings.

The lap or cross joint to be formed of a high grade oil cement. Butter the upper end of each course of tile as laid, then install course above producing a squeeze joint at overlap.

Special tile to be furnished where necessary; these tile to be detailed and manufactured to interlock and fit in with adjacent tile without field cutting.

Glass Tile—Top lighting shall be provided by Precast Reinforced Concrete Tile with Glass Inserts. Locate as shown on the drawings. These tile are to be made so as to be interchangeable with the standard 52-in. interlocking tile.

The mix, material and workmanship of these tile shall be the same as the standard interlocking tile. A sheet of ¼-in. wire glass 21x35 in. is to be embedded in the concrete during the process of manufacture of the tile, thus becoming an integral part thereof.

The four edges of the glass are to be triple dipped in a special asphalt compound, forming a cushion on all four sides, to allow for expansion and contraction.

A condensation gutter and weep hole formed in the concrete at the lower edge of glass is to be an integral part of the glass tile.

Flat Slabs—The flat roof decks and gutters are to be Precast Reinforced Concrete Flat Slabs, 24 in. wide, of a length to fit purlin spacing and not less than 1⅝ in. thick for the standard 5-ft. slabs, composed of an approved brand of portland cement and the highest grade washed torpedo sand in a mixture of 1 part of cement to 3 parts of sand accurately graded, thoroughly mixed, tamped and kneaded so as to obtain the greatest possible density.

Each slab is to be reinforced with a sheet of cold drawn wire mesh, the longitudinal wires of which shall be spaced not more than 2 in. apart and cross wires woven around the longitudinal wires.

The under side of the tile shall present a smooth surface free from cracks or form marks, and shall be of a uniform natural gray cement color.

All joints of the flat slabs are to be cemented on the upper side with an approved brand of asphaltic cement and present a smooth surface ready for the application of the composition covering.

Channel Slabs—The flat roof decks are to be Precast Reinforced Concrete Channel Slabs 24 in. wide and 2¾ in. deep for spans up to 6 ft. 6 in. and 18 in. wide and 3⅝ in. deep for longer spans. The web thickness is to be a full inch, composed of an approved brand of portland cement and the highest grade of washed torpedo sand in a mixture of 1 part of cement to 3½ parts of sand accurately graded, thoroughly mixed, and vibrated so as to obtain the greatest possible density. Each leg is to be reinforced with one deformed bar accurately centered so as to have at least ½ in. of dense, impervious concrete on all sides. The web of the slab is to be reinforced with a sheet of triangular cold drawn wire mesh accurately centered.

All joints of the channel slabs are to be cemented on the upper side with an approved brand of asphaltic cement and present a smooth surface ready for the application of the composition covering.

The Federal Blue Print Book "Roof Standards"

The Federal Blue Print Book "Roof Standards," containing 28 pages of details of roof construction, will be sent on request. The drawing below is a typical illustration.

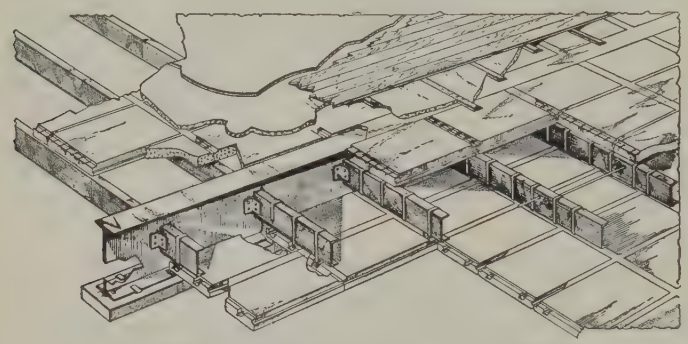
Product

Manufacturers and erectors of "Gypsteel" Pre-cast and Poured-in-place Floors and Roofs.

"Gypsteel" Gypsum Partition Tile.

"Gypsteel" Pre-cast Floors (Patented)

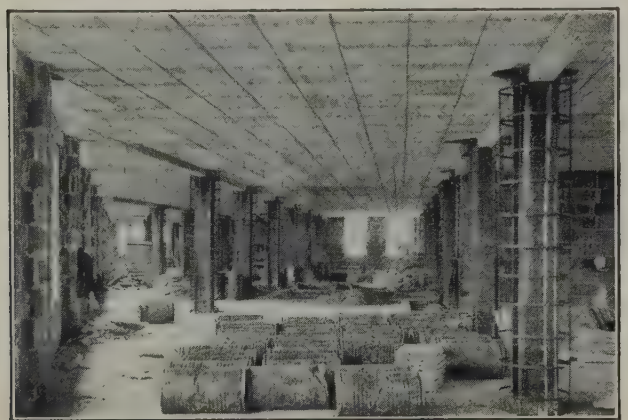
"Gypsteel" pre-cast floors economically combine the calculable strength of structural steel with the unequalled fire protection and lightness of gypsum. This floor construction consists of *standard sections of rolled steel channels,* spaced 30 in. on centers, on which are laid pre-cast gypsum floor slabs 2½ in. thick, and from which are suspended ceiling slabs of the same material, 2 in. thick.



"Gypsteel" Pre-cast Floor Construction

The channels, being of structural steel, are designed for the required loads in accordance with the usual practice, and may be used for any spans between supporting girders or walls up to 24 ft. They are supported at girders by means of standard web connections. Channels are *not coped,* but are framed with their top flanges 2 in. below the top flanges of the girder.

Where columns and girders are not required, these channels may be supported by the exterior and interior walls, their ends being built into the walls as the latter are erected.

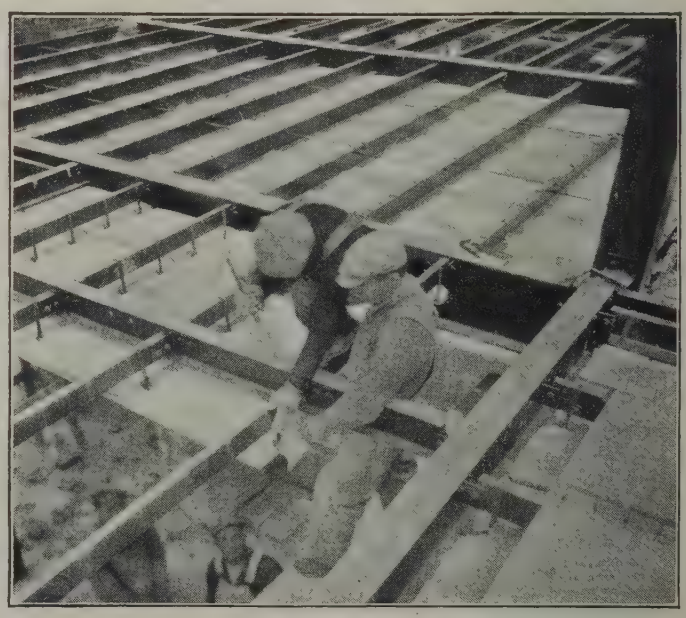


Ceiling Slabs Grouted and Ready for Plaster

Ceiling Slabs—The ceilings consist of "Gypsteel" pre-cast slabs 2 in. thick, 2 ft. 6 in. in length and 2 ft. in width, composed of the highest grade, scientifically calcined gypsum, with which is incorporated a small percentage of binder that imparts to the slab a peculiar toughness and elasticity. These slabs perform the double function of providing a flat ceiling underneath and completely *fireproofing* the channels.

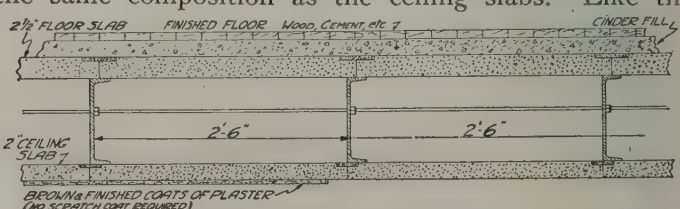
The ceiling slabs are reinforced with steel bars running lengthwise through the slabs and projecting from either end. When erected, these projecting bars pass through slots in heavy steel hangers clamped to the top flanges of the channels, suspending the slabs and yet holding them tightly against the soffits of the channels. Generous slots are formed where the slabs abut each other, at both sides and ends, by means of rabbets. The slots are filled solidly with gypsum grout, completely sealing them and preventing the passage of any heat through the joints.

The ceiling is then immediately ready for brown and finish coats of plaster—*no scratch coat being necessary* as required for metal lath and other materials.



Erection of "Gypsteel" Ceiling Slabs
Grouting to follow

Floor Slabs—"Gypsteel" floor slabs are made of the same composition as the ceiling slabs. Like the



Cross Section "Gypsteel" Pre-cast Floor Construction

Continued on next page

latter, they are pre-moulded at the factory and shipped to the job ready to erect. They are 2½ in. thick, 2 ft. in width and 2 ft. 6 in. in length.

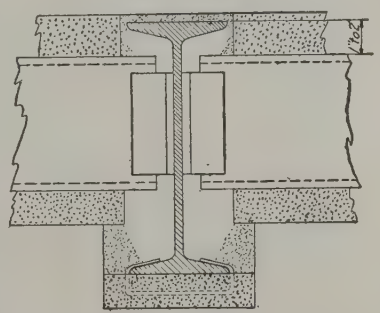
The slabs are reinforced with $\frac{3}{16}$-in. cold drawn wire rods (uniformly and accurately located in accordance with accepted engineering formulae), which emerge from the ends of the slab within ½ in. of the top surface, projecting about 2½ in.

When these slabs are set in place upon the steel channels, the projecting ends of the opposite rods in abutting slabs are tied together by a mechanical device which draws them up taut at these connections, *making the reinforcement continuous.*

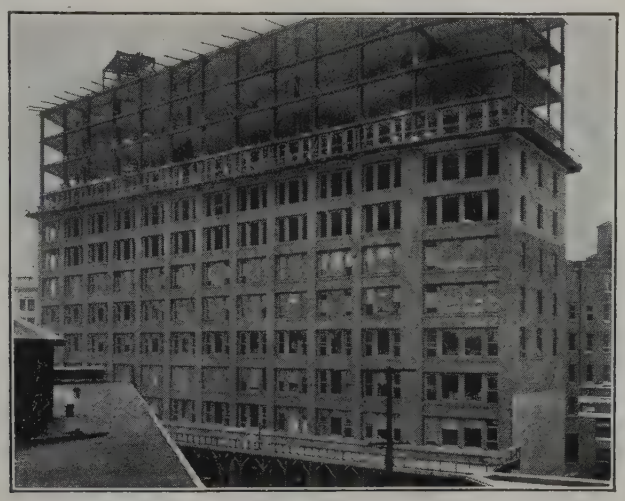
Erecting "Gypsteel" Pre-cast Floor Slabs

As the ends of the slabs are rabbetted where the rods emerge, these ties lie in a depression which is filled with a gypsum grout, firmly embedding the ties and smoothed off flush with the top surface of the slabs. The floor is then ready to receive the finish as desired.

Girder Fireproofing—Where the floor channels are supported by girders, the projecting webs and flanges of the latter are fireproofed by means of "Gypsteel" pre-cast soffit-slabs, 2 in. in thickness. These slabs have embedded in them ¾x⅛-in. flats, the ends of which project through the upper surfaces and are clamped over the girder flanges. Plastic gypsum is then poured in the space between top surfaces of the soffit-slabs and adjacent ceiling slabs. This fill is troweled off square and flush with outside edges of soffit-slabs.



Cross Section at Girder, "Gypsteel" Pre-cast Floor Construction, Showing Girder Fireproofing in Place



"Gypsteel" Pre-cast Floor, Sibley, Lindsay & Curr Department Store, Rochester, N. Y.
J. Foster Warner, Architect

Principal Advantages of "Gypsteel" Pre-cast Floors

Economy—They are the most economical type of first class fireproof floor construction which can be employed.

Strength—Their load carrying capacity is accurately calculated upon the strength of the supporting rolled steel channels, spaced 30 in. on centers. The ability of the "Gypsteel" pre-cast floor slabs to transmit the load to these channels was conclusively proven by tests conducted by Columbia University Testing Laboratory for the Bureau of Buildings, New York City, in which *concentrated loads* were applied by machine at the *third points* of one of the 2 ft. 6-in. spans for the full width of the slab. Failure did not occur until the load had reached *1482 lb. per sq. ft.,* equal, approximately, to 2000 lb. per sq. ft. uniformly distributed. These floors may, therefore, be safely designed for total loads up to 250 lb. per sq. ft. *with a factor of safety of 6 on the third-point loading,* or a factor of safety of approximately 8, based upon a uniform loading.

Fire Resistance—"Gypsteel" pre-cast floors have successfully passed the standard fire, load and water tests required by the principal cities of the United States for first class fireproof floor construction.

Lightness—"Gypsteel" pre-cast floor construction (including channels) is usually not only lower in first cost than any other type of fireproof floor with flat ceiling underneath for a given span and load, but its extreme lightness in weight invariably permits of a substantial saving in the tonnage of girders and columns.

TABULATION OF DEAD LOADS

	Lb. per sq. ft.
Channels (average)	5
"Gypsteel" floor slabs	12
"Gypsteel" ceiling slabs	9
2-in. cinder fill	10
Wood floor	4
Plastering (no scratch coat)	4
Total	44

Note: If cement finish instead of wood floor is used add 8 lb. per sq. ft.

Time Saving—The "Gypsteel" floor and ceiling slabs, being in standard sizes, are carried in stock at the factory and arrive at the job dry and ready to erect. There is *no formwork.* As the slabs are dry when set, the *ceiling could be plastered the same day,* if desired. And as there is *no water* entering into the construction (except the small amount used in the grouting), there is *no drying out to delay the finishing of the building.*

"Gypsteel" Long Span Pre-cast Roofs (Patented)

"Gypsteel" pre-cast roof construction is designed upon the suspension-bridge principle. It is, in effect, a monolithic roof after the erection is completed. The slabs are moulded in steel forms, into which the steel cables are placed and put into uniform deflection and tension by means of deflection rods restrained at the sides of the moulds. The cables are securely anchored to the moulds at points beyond the ends of the slabs, being removed from this anchorage when the gypsum has set, each cable emerging from the ends of the slab within ½ in. of the top surface, and projecting about 2 in.

When the slabs are set in place on the purlins, with their ends abutting, the projecting ends of the oppo-

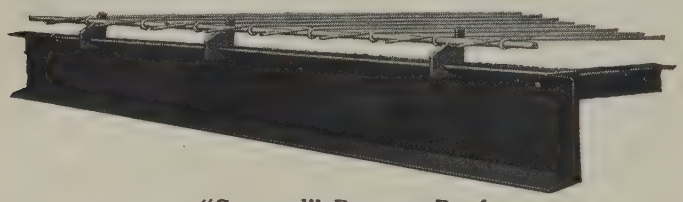
site cables in each slab are tied together by a mechanical device which draws them up taut at the connections; and as the ends of the slabs are rabbetted where the



"Gypsteel" Pre-cast Roof
Showing perfect mechanical anchorage of steel in slabs to the steel framework of building, independent of the gypsum

cables emerge, the ties lie in a depression filled with a gypsum grout, firmly embedding the ties and troweled off flush with the top surface of the slab.

Innumerable load tests which have been made on "Gypsteel" pre-cast roof construction have shown in every instance, that it will develop more than the factor of safety of 4 upon which the supporting steel cables are designed, the cable ties holding firmly until the ultimate strength of the steel in tension has been reached.

SAFE TOTAL LOADS PER SQUARE FOOT, PRE-CAST ROOF CONSTRUCTION

Slab width, in.	Cable spac. in.	Number cables per slab	Distance between supports center to center, ft.-in.												
			4–0	4–3	4–6	4–9	5–0	5–3	5–6	5–9	6–0	6–3	6–6	6–9	7–0
24	4	6	136	122	108	98	88	80	72	66	61				
	3.43	7	159	142	126	114	102	93	84	78	72				
21	4.2	5									59	54	50	46	
	3.5	6									70	64	59	55	
	3	7									82	76	70	65	
	2.62	8									94	87	80	74	
18	3.6	5												54	50
	3	6												65	60
	2.57	7												76	70

$W = 1152\ Td \div bL\sqrt{L^2 + 16d^2}$ where W = safe load in lbs. per sq. ft. T = cable strength = 0.0274 (area of $\frac{3}{16}$-in. cold drawn steel-wire rods) × 20,000 (unit working stress) = 552 lb.; d = deflection of wires in inches; b = cable spacing in inches and L = clear span in inches.

Slab thickness in all cases, 3 in., weight 14 lb. per sq. ft.

Note: While this table is not extended beyond the usual range of roof loads, slabs will be designed and furnished for any greater load capacities which may be desired, in order to meet special conditions. This is accomplished by decreasing the cable spacing for any given span.

"Gypsteel" Pre-cast Roof, Porter Street Pier, Philadelphia, Pa.

Advantages of "Gypsteel" Roof Construction

Economical First Cost—Its extreme lightness in weight and adaptability to wide purlin spacings effect substantial savings in the total steel tonnage of the purlins, trusses and columns, making it the most economical of any first class type of roof construction.

Saving in Heating—The "Gypsteel" composition used in the slabs is a most remarkable non-conductor of heat. It thus minimizes heat loss through the roof, *reducing the consumption of coal annually,* and effecting a further saving in the initial cost of the heating plant.

Preventing Condensation—"Gypsteel" roof construction pre-insures against the forming of condensation on the underside of the roof; and as the full depth of the slab (3 in. minimum) *passes over the tops of the purlins,* it also thoroughly insulates the supporting steel work.

Time Saving—"Gypsteel" pre-cast slabs are manufactured at the factory. Being ready for shipment when the erection of the steel work begins, the speed of installation is limited only by the progress of the steel erection ahead of it, and the slabs being dry the waterproofing follows the slab erectors just as closely.

Elasticity—"Gypsteel" successfully resists the most severe vibrations without cracking.

Corrosionproof—"Gypsteel" composition has been proved by more than 20 years' experience to be a perfect preservative of the incased steel against corrosion.

Close-up View of Cable Ties, "Gypsteel" Pre-cast Roof
Note that grouting is used on the side as well as end joints giving in effect when finished a monolithic gypsum slab

Non-expansive—"Gypsteel" roofs will neither expand nor contract, and are therefore free from cracks, spalling and internal stresses which frequently occur from this cause in concrete and other similar materials.

Attractive Appearance of the Underside of "Gypsteel" Long Span Roof Slabs, Senior-Junior High School, Harrisburg, Pa.
C. Howard Lloyd, Architect

Continued on next page

Attractive Appearance—"Gypsteel" roofs give a much more attractive appearance underneath than any other type of roof remaining unplastered, since the slabs are factory moulded on rubber mats, leaving a smooth, even surface underneath.

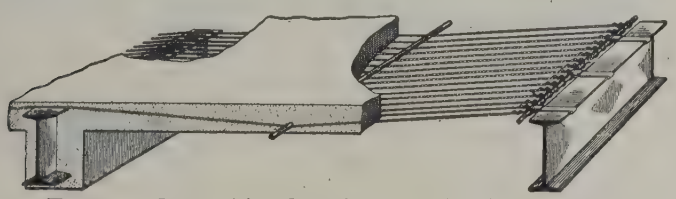
Replacement of Old Roofs—*The replacement of old roofs is readily accomplished by the use of "Gypsteel" pre-cast construction with a minimum of annoyance to the work in process below. Its lightness in most cases renders increased steel work unnecessary over that which would be required for the support of wood, etc.*

Poured-in-place Construction

Where flat ceilings are not required and floor or roof beams may be spaced not to exceed 8 ft. on centers, "Gypsteel" poured-in-place floor and roof construction combines the highest degree of fire resistance with economy. Its lightness (12 to 16 lb. per sq. ft.) permits of a substantial saving in the tonnage of steel.

The design of "Gypsteel" poured-in-place construction is based upon the *principle of the suspension bridge.* Cables of cold drawn steel wire are spaced from 1 to 3 in. apart (depending upon the spans and loads) and are securely anchored at both ends of a series of beams by means of bars and anchors of a section of metal sufficiently heavy to develop the ultimate strength of the cables in tension.

The cables are put into uniform deflection and tension between each pair of beams by means of continuous steel deflection rods.



Type 2. Poured-in-place "Gypsteel" Floor or Roof

"Gypsteel" composition is then poured-in-place between the beams, upon wood forms or centering, and is brought to a level surface about ½ in. above the top flanges of the purlins. It is then ready to receive the fill and finished floor on top. The projecting webs and flanges of the beams and girders are also incased in the same composition poured at same time as the floor slab.

This "Gypsteel" composition consists of the highest grade, scientifically calcined gypsum with which is incorporated wood fiber or chips to serve as a binder and impart to the slab its peculiar toughness and elasticity.

The strength of a "Gypsteel" poured-in-place floor or roof can be proved by accepted engineering formulae, as the desired live and dead *load capacity* of the slab *is calculated upon the structural value of the securely anchored steel cables, in suspension,* under a factor of safety of 4.

Installation

"Gypsteel" construction is installed by our own field organization under competent foremen and superintendents of many years' experience.

When desired, however, contracts will be taken for furnishing "Gypsteel" pre-cast slabs f.o.b. cars factory, with freight allowed to destination—we loaning one of our experienced working foremen to the contractor or owner to supervise the erection, for which no charge is made other than his actual time and expenses.

Estimates and Designs

Complete proposals for furnishing and installing "Gypsteel" floors and roofs will be promptly furnished on request. When it can be done conveniently, we suggest sending plans to our nearest sales office. This permits our Engineering Department to go over all of the details of the steel design and incorporate in our proposal an estimate of the total tonnage of steel which can be saved by reason of the lightness in weight of "Gypsteel."

Where plans have not yet been drawn, our Engineering Department will gladly co-operate in the preparation of the steel design to develop the maximum economy by the use of "Gypsteel" construction. This service is gratis, and imposes no obligation whatsoever upon the architect, engineer or owner.

"Gypsteel" Gypsum-Partition-Tile

Gypsum partition and furring tile, and column covering, is manufactured at the new plant of the Structural Gypsum Corporation, Linden, N. J.

Continuous machine methods are used, assuring a product of uniformity in size, strength, density and weight. An entirely new process (patented) permits of calcining gypsum of a consistently higher analysis than is generally required or used.

Specifications, tables of weights and sizes, comparative weights of Gypsteel partition tile and clay tile, and other pertinent data will be furnished upon request.

Bulletins

Complete bulletins, containing full designing details, will be gladly sent on request.

Service

Our mills, located at advantageous points throughout the country insure prompt delivery and economic distribution. We control the materials and construction from mine to building, thus guaranteeing satisfaction.

An Engineering and Construction Department is maintained to assist engineers and architects in designs and estimates. It is advisable to consult us when laying out your roof and floor steel. Without obligation we will gladly submit bids on Pyrobar or Pyrofill roofs for new or re-proofing jobs, for Pyrobar and Pyrofill floors, or placing an insulation deck on your present roof.

Gypsum Roof and Floor Construction

Description—We have several types of gypsum constructions for floors and roofs, which divide into two general forms—precast Pyrobar roof tile, floor tile and ceiling tile; and poured-in-place Pyrofill floor and roof construction.

Pyrobar roof tile are made of "Structolite," an especially prepared dense structural gypsum, reinforced with electrically welded, galvanized steel mats. Manufactured in two general types; long span hollow and short span, either solid or hollow.

Pyrofill consists of gypsum stucco to which has been added as a binder or aggregate, a small percentage of fibre, usually soft wood shavings. The two general types of Pyrofill construction are: (1) Sheetrock-Pyrofill construction which is poured on permanent Sheetrock forms or centering, resting on light rail or other steel framing and reinforced with a welded wire mat. (2) Pyrofill Monolithic construction, which is poured on wood forming similar to that used for concrete construction, and reinforced as a suspension system with twisted wire cables.

Pyrobar structural floor tile are made of Structolite, and reinforced to take the floor loads. The ceiling tile are provided with means of positive anchorage to the floor joists above, affording complete fire protection to the steel joists.

Sheetrock-Pyrofill Roof Construction

Sheetrock-Pyrofill construction can be economically used on practically any sized structure and is well adapted to small variations in purlin spacing. By increasing the size of the rail subpurlins, spans to 12 ft. 6 in. or even greater may be accommodated, spanning directly between trusses if desired. For ordinary framing conditions, however, a span of 6 to 8 ft. will be found the most economical.

Sheetrock-Pyrofill construction particularly well adapts itself to the decking of auditoriums, garages, theaters, gymnasiums, industrial plants—in fact, any steel framed building where a light weight, highly insulative roof deck with a finished ceiling effect is desired.

Sheetrock-Pyrofill Roof Deck, Curtiss-Robertson Aircraft Co., Anglum, Mo.
J. S. ALBERICI, Architect

Drainage fill may be constructed of Pyrofill, if desired. Curbs may be either pre-cast or poured-in-place.

The Sheetrock-Pyrofill construction consists of a reinforced gypsum slab poured on a permanent Sheetrock form. ⅜-in. Sheetrock, in lengths equal to the purlin spacing, is supported on the bottom flange of the light rail or T-iron subpurlins, which are spaced 32½ in. on center and clipped to the roof purlins. A gypsum slab of required thickness, reinforced with a continuous, electrically welded steel fabric, is poured directly on the Sheetrock. All joints being concealed by the purlins, the underside of this roof has more the appearance of a finished ceiling than a roof deck.

Advantages—***Light Weight***—Gypsum is 50% lighter than concrete, per square foot of surface for equal thickness, which results in considerable saving in steel framing, supporting members and other material throughout the building.

Fireproof—The value of a fireproof roof deck cannot be over-emphasized. It will prevent transmission through the roof of fire from adjacent buildings. The fireproof qualities of gypsum as a building material have been established definitely by many tests made in the Underwriters' Laboratories, Inc., and by the bureaus of building in many of the larger cities.

Durability—The durability of gypsum has been established through many years of use. It is not affected by chemical action of smoke or deteriorating action of fumes from sulphurous acid. Thus, the maintenance cost is reduced to a minimum.

Insulation—Gypsum has the highest insulation value of any cementaceous structural building material. On account of its low conductivity, the undersurface of gypsum roof decks remains at practically the same temperature as the interior of the building, regardless of outside temperatures. This tends to eliminate sweating or dripping, and condensation under moist air conditions.

We will be pleased to furnish you, upon request, authentic test data showing conductivity values and heat losses through Pyrobar and Pyrofill Gypsum Roof Decks, and comparative values for other types of roof constructions.

We have also prepared charts and tables that will be of material assistance to the designer and engineer in figuring the amount of insulation required for the conditions in his building.

Continued on next page

Ease of Erection—The simplicity of this construction permits of rapid erection, thereby reducing construction costs, and also permitting earlier occupancy of the building. No waiting for slabs to cure or forms to be removed. This system eliminates the end bay bracing required for the poured suspension system. Drainage fill may be constructed of Pyrofill, if desired. Curbs may be either precast or poured-in-place.

RAIL SIZES FOR PURLIN SPANS UP TO 12 FT. 6 IN.
With fiber stress not exceeding 18,000 lb. per sq. in.
Note: 50 lb. per sq. ft. total load — B.M. = W.L./10

Span at main purlins	Size of rail, lb.	Wt. of rail per sq. ft. of roof, lb.	*Min. thickness of slab, in.	Wt. of slab including rail, lb.
Up to 6′0″	8	1.00	2½	11.50
6′0″ to 8′6″	12	1.50	2½	12.00
8′6″ to 10′8″	16	2.00	2½	12.50
10′8″ to 12′8″	20	2.50	3	15.00

*Includes thickness of Sheetrock.

Specifications for Sheetrock-Pyrofill Roof Deck

Unless otherwise shown or noted, all roof slabs shall be of the thickness shown on plans and shall be constructed according to the UNITED STATES GYPSUM COMPANY'S system of Sheetrock-Pyrofill roof construction. This contractor shall provide all Sheetrock, subpurlins, reinforcing material, Pyrofill and all labor required for this work. Light rails or T-iron subpurlins shall be laid and fastened to the main purlins by clips. The subpurlins shall be so spaced as to accommodate the size of Sheetrock used, and shall be figured to carry the total live and dead loads. The Sheetrock shall be provided in lengths equal to the main purlin spacing with no cross members or joints showing. The Sheetrock shall be laid on and supported by the bottom flange of the subpurlins, and on the boards shall be laid an electrically welded, continuous, galvanized steel fabric of the proper sectional area to carry the specified roof load. The main wires of this fabric shall run at right angles to the subpurlins.

The Pyrofill composition used shall consist of a uniform mixture of calcined gypsum and water into which is stirred not over 12% by weight of wood planer shavings and shall be poured directly on the Sheetrock to the required thickness and screeded to as smooth a surface as practicable to receive the waterproof roof covering.

If the underside of the slab is to be painted, or otherwise decorated, such work shall not be done until the waterproof roof covering has been applied, and the slab is thoroughly dry.

All openings in slabs for down-spouts, soil pipes, vents, etc., shall be accurately located by the purchaser before the slab is poured. Curbs above and below monitor or sawtooth sash shall be constructed of Sheetrock-Pyrofill or Pyrobar precast tile, the latter reinforced when carrying roof load or drainage fills.

End walls of monitors, saw-tooth skylights, "A" frames, etc., may be constructed of Pyrobar curb tile (3x15x30 in. non-reinforced).

The waterproof roof covering shall be applied by the roofing contractor as soon as possible after the slab is erected, preferably within 20 days.

Pyrofill Monolithic Roof and Floor Construction

With this type of construction the load is carried entirely by steel wire cables. These cables are anchored at both ends to the steel framing, and are brought into tension in the center of each span, between the purlins, by means of rods fastened to the wood forming. The gypsum composition acts mainly as a filler to transmit the load to the "catenary" thus formed. The spacing of the cables varies from 1 to 3 in. and the depth of slab from 3 to 5 in. to meet the requirements of load and span. 3 in. for roofs and 4 in. for floors are the generally used depths of slabs, and the most economical spacing of suporting purlins is from 5 to 7 ft. on centers. The weight of the slab is 4 lbs. per sq. ft. per inch of thickness—i.e. a 3 in. slab weighs 12 lbs. per sq. ft., and a 4 in. slab weighs 16 lbs. per sq. ft.

Wood forming is used for the slabs and, if desired, forms may also be built around the supporting beams and girders to give monolithic fireproofing of the steel with the gypsum composition. (See also Pyrobar Beam and Girder Fireproofing on page A431.) Forms are built of dressed and matched lumber and, due to the light weight of gypsum, do not require the extensive shoring needed for concrete forming, but are hung and braced from steel framing.

The suspension type of gypsum floor and roof construction

TYPICAL MONITOR CONSTRUCTION

CONSTRUCTION·DETAILS·SHOWING·TYPICAL·DESIGNS·OF·MONOLITHIC·ROOF·CONSTRUCTION

has been in use for over 30 years under various names. With the supporting steel encased in gypsum, this construction enjoys the highest insurance rating and is recommended for buildings with combustible contents where insurance rates will be a factor.

The Pyrofill monolithic system best adapts itself to floor slabs of multistory steel framed office, hotel and similar buildings, where light weight is a factor, and to the roof decks of large industrial plants, especially in paper mills or wet process plants where a very low over-all conductivity must be maintained.

Specifications for Pyrofill Monolithic Roofs and Floors

Unless otherwise shown, all slabs shall be constructed of poured gypsum in accordance with the system of the UNITED STATES GYPSUM COMPANY known as Pyrofill Monolithic Slab construction. This contractor shall provide necessary forms, reinforcing cables, Pyrofill and all labor required for his work.

Forms—The forms shall be made in a workmanlike manner, of suitable material, and shall be carefully leveled up so as to insure a uniform depth of slab. Forms shall be cleaned before each re-use, and shall be wet down immediately before placing the Pyrofill.

Reinforcing—Reinforcing shall consist of galvanized steel cables made by twisting two No. 12 wires. These cables shall be calculated to take the entire slab load and shall be fastened at their ends in such manner as to develop the full strength required. In no case shall the stress in the cables exceed 20,000 lbs. per sq. in., or more than 20% of the ultimate strength. The spacing of these cables and the depth of slabs shall conform to the standards of the UNITED STATES GYPSUM COMPANY. The cables shall be drawn tight and fastened to suitable anchors and brought to uniform tension. Care shall be used in placing the tension rods to see that the cables shall not be brought closer than ½ in. to the under surface of the slab. After cables are in place all workmen of this and other contractors shall be prohibited from walking thereon.

Composition—The Pyrofill composition used shall consist of a uniform mixture of calcined gypsum and water into which is stirred not over 15% by weight, of wood planer shavings. The top surface of the slab shall be screeded to as smooth a surface as practical to receive the waterproof covering. If the underside of the slab is to be plastered, such work shall not be done until the waterproof covering has been applied. If the underside of the slab is to be painted, such work shall not be done until the waterproof covering has been applied and the slab is thoroughly dry.

Curbs, etc.—All curb walls, ends of monitors, etc., shall be constructed of 3-in. Pyrobar Curb Tile neatly laid up in gypsum mortar, or of poured construction similar to roof slabs.

Openings—The steel contractor shall provide steel framing around all openings more than 12 in. in diameter, and such steel bracing as is required to take the horizontal pull of cables where anchored, such as at end bays of buildings, and at all openings. All openings for down-spouts, soil pipes, vents, etc., shall be accurately located by the purchaser before the slab is poured.

Covering—The waterproof covering shall be applied within 20 days after completion of roof slab. Plank runways shall be laid on the slab before any wheeling whatever is done. Plank supports shall be laid from purlin to purlin to take any heavy or concentrated loads which may be applied to the slab.

Insert in steel specifications: Steel contractor shall submit drawings to the UNITED STATES GYPSUM COMPANY for checking, to insure that all details are properly taken care of.

Pyrobar Reinforced Roof Tile

Advantages—This type of roof tile construction has all the advantages of a poured-in-place gypsum roof and is highly recommended where a precast type of roof deck is desired. It provides a flat light reflecting under surface, and the units are of convenient size to erect. The tile can be erected by the purchaser if he so desires.

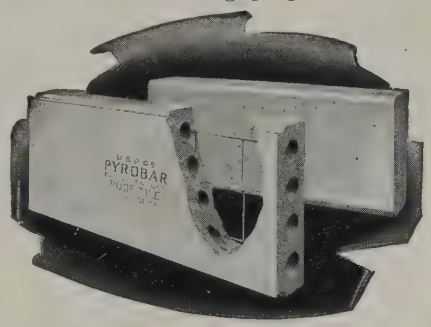
Short Span Roof Tile on U. S. G. Bulb Tee before Grouting of Joints and Application of Roof Covering

Continued on next page

Pyrobar Short Span Roof Tile

All short span roof tile are manufactured 12 in. wide and 30 in. long, and in thickness either of 3-in. solid or 4-in. hollow. The 3-in. solid is recommended particularly for nailing purposes because its design assures maximum penetration and therefore, maximum nail-holding power. The 4-in. hollow fills all requirements for a light weight tile of high insulation value on which a built-up roof covering is to be applied. The hollow tile is not recommended for nailing purposes.

Short span, or 30-in. roof tile, require subpurlin supports, usually tees, such as the United States Gypsum Company Bulb Tee section, or light structural shapes such as I-beams or channels.



Short Span Pyrobar Roof Tile

This type of construction is by far the most flexible of any precast system. It can be used with economy on any type of factory, industrial building, power plant, school, etc., and, in addition, is particularly well adapted to steep pitched roofs, or roofs that are badly cut up with dormers, hips, valleys and difficult intersections.

Curb or walls for monitors and sawtooth sash are built of 3-in. solid Pyrobar curb tile.

Cinder Pyrofill drainage system may be used when drainage fill is required over Pyrobar precast roof tile.

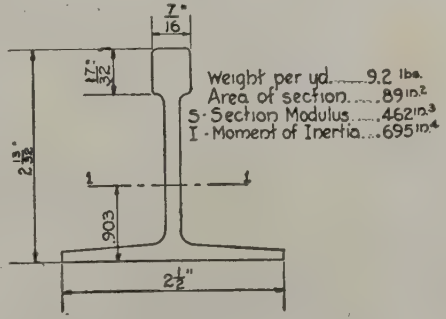
United States Gypsum Bulb Tee Section

This section has been developed by us primarily for use with Short Span Pyrobar roof tile, as a more economical subpurlin, taking the place of standard tees. It has a wide flange providing ample bearing for the tile, and its design is such that it has considerable less sectional area than a standard tee of equal load bearing capacity. We are prepared to furnish this section erected in place, in connection with our installations of Short Span Pyrobar tile for roofs. If desired, it can be sold in connection with your installations of this tile.



Section of U. S. G. Bulb Tee

Pyrobar Long Span Hollow Roof Tile

This type of tile is manufactured in lengths 4 ft. to 6 ft. 6 in. and in depths 5 in. and 6 in. The tile are laid directly on the steel purlins or wood framing, and are manufactured to suit the steel layout. The tile are furnished either with or without a lap joint depending on the bearing afforded. Lap joint tile should be used whenever channel purlins are used.

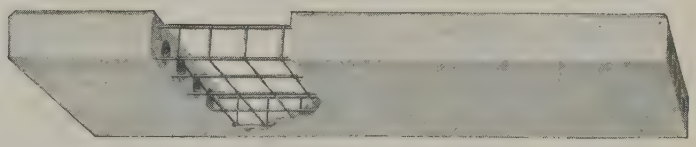
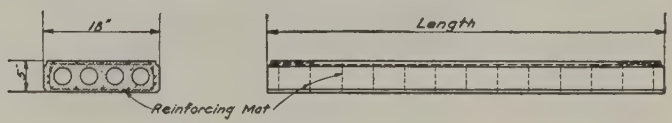
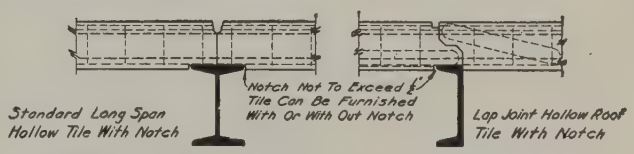
Showing framing around dormers





LONG SPAN HOLLOW TILE



Details of Pyrobar Long Span Hollow Roof Tile

Specifications for Pyrobar Roof Tile

Short Span Roof Tile—*Roofs*—All roofs as shown on drawings, unless otherwise noted, shall be constructed of Pyrobar 3 in. solid (4 in. hollow) roof tile, as manufactured and erected by the United States Gypsum Company, laid on U. S. Gypsum 9.2 lb. Bulb Tee Subpurlins, as indicated on the drawings.

Erection—Tile to be placed directly on supports, without mortar, and with sides tight together, with full bearing on the subpurlins. All joints on top surface only of roof are to be pointed with Gypsum mortar composed of one part unfibred gypsum cement plaster and not more than two parts of clean sharp sand. Bulb Tee subpurlins are to be furnished and erected by the United States Gypsum Company spaced 2 ft. 6¾ in. o. c. and fastened to the main purlins by clips bolted to the subpurlins.

Note: Where it is desired to nail composition or a shingle roofing, copper or tin sheathings, or other light roof coverings directly to the Pyrobar roof deck, we recommend 3-in. solid Pyrobar and a square cut nail, having not less than 1½-in. penetration into the tile. For rough slate, Spanish tile, etc., a square cut nail having not less than 2-in. penetration into the tile is recommended. On roofs with extreme pitch, or where extra heavy slate or tile roofing is used, special means of fastening should be considered. If desired we can furnish a short span tile with nailing strips embedded flush with the surface.

Note: When desired the Bulb Tee subpurlins and clips can be furnished and fabricated by the United States Gypsum Company and included in the steel contractor's specifications for erection.

Tractor Plant, Fort Wayne, Ind., International Harvester Company
DAY AND ZIMMERMAN, Architects
160,000 sq. ft. Long Span Hollow Pyrobar Roof Tile Used in 1923; 150,000 sq. ft. additional in 1928

Curbs, End Walls—Curbs under monitor and sawtooth sash, and end walls of monitors, etc., shall be constructed of 3 in. solid Pyrobar curb tile (or gutter tile), set in gypsum mortar, joints to be well bedded and struck. Steel contractor to provide sufficient steel framing for proper support and anchoring.

Completion and Covering—All Pyrobar Roof Decks to be left with as smooth a finish as practical to receive the roofing contractor's covering, which shall be applied within 20 days after completion of the roof deck.

Long Span Hollow Tile—*Roofs*—All roofs as shown on drawings, unless otherwise noted, shall be constructed of Pyrobar (state thickness) Long Span Hollow Roof Tile as manufactured and erected by the UNITED STATES GYPSUM COMPANY.

Erection—Tile are to be placed directly on roof supports without mortar and with sides tight together bearing at each end upon purlins to be not less than 1¼ in. All purlins to be drawn into true alignment with sag rods by the structural steel contractor before any tile are placed. All joints on top surface only of roof are to be pointed with gypsum mortar, composed of one part unfibred gypsum cement plaster, and not more than two parts of clean, sharp sand.

End walls, curbs, completion and covering same as under Short Span.

Pyrobar Interlocking Structural Floor Tile and Ceiling Tile

Floor tile—These are precast units of gypsum, 2½ in. thick and 18 in. wide, by 32 in. long. They are made to fit standard joist spacing of 30 in. The size of the units and their weight of 12½ lb. per sq. ft. assures quick erection. Provision can be made for any type of floor finish over these tile.

Ceiling Tile—These are precast units of gypsum, 2 in. thick and 18 in. wide, by 30 in. long. The smooth undersurface will save in plastering as only two coats are required. The method of erection provides a positive attachment to the floor joists and absolute protection to steel framing and floor above. The large units weigh only 9 lb. per sq. ft. and are rapidly erected.

These units can be used in combination with Pyrobar Shoe Tile to provide complete protection for beams and girders.

Advantages—This construction has been developed to provide a lightweight floor and ceiling construction that is fireproof and will thoroughly protect the steel joists. It is especially adaptable to buildings where floor loads are light, such as apartments, hotels, schools, office buildings, theaters, and is designed for use in connection with junior beams, standard channels, and metal joists.

The fireproof qualities of gypsum tile have been successfully demonstrated by numerous tests made at the Underwriters Laboratories, Inc., and the Bureau of Standards. These tile have a low coefficient of conductivity and are of sufficient thickness to afford complete protection to the steel. The expansion and contraction of Pyrobar tile under fire is practically negligible, never being great enough to cause buckling or bulging.

Pyrobar Interlocking Floor Tile are designed to develop the full strength of the supporting steel. They will safely carry a uniformly distributed load of 150 lb. per sq. ft. with a factor of safety of 6, which is more than ample to take care of loads in buildings of the types mentioned.

Specifications Interlocking Tile

General—All floor and ceiling slabs, except where shown or noted otherwise, shall consist of the Interlocking Precast Structural Floor Tile and Precast Ceiling Tile as manufactured by the United States Gypsum Company. They shall be erected in place by the manufacturer.

Floor Tile—Floor tile shall be Pyrobar Interlocking Structural Floor Tile of 2½ in. thickness as shown on the plans, 32 in. in length, and 18 in. wide, properly reinforced.

Ceiling Tile—Ceiling tile shall be Pyrobar Precast Ceiling Tile, 2 in. thick, 18 in. wide, and 30 in. in length, reinforced with provision for proper anchorage to the under side of the floor joists.

Beam and Girder Fireproofing—Beams and girders projecting below the floor joists shall be covered with precast Pyrobar beam and girder fireproofing as manufactured by the United States Gypsum Company.

Roof Construction—Pyrobar Structural Interlocking Floor Tile and Ceiling Tile shall be used for the roof construction, same as specified for floor construction.

Note: Where roof framing is so designed as to call for spans greater than 30 in. roof slabs shall consist of 30 in. short span tile, 3 in. solid, with T-iron subpurlins spaced 30¾ in. on center, or Sheetrock Pyrofill Roof Construction, with a total slab thickness of 2½ in. Roof slabs (either of the above type), including T-irons (or rail) subpurlins shall be furnished and erected by the United States Gypsum Company.

Floor Finishes—Wood floor finish, where indicated on the plans, shall be laid on nailing strips, as specified under "Carpentry."

(Note to Architect)—Above to be placed in Carpenters' Specifications.

Cement, marble, tile, linoleum, rubber, carpet, and similar wearing surfaces shall be applied in accordance with the manufacturer's specifications over a suitable fill and topping.

Plastering—Gypsum Plaster (two coats) shall be applied directly to the undersurface of the ceiling tile.

THE AEROCRETE CORPORATION OF AMERICA

Promoters of Aerated Concrete

51 East 42nd Street

NEW YORK, N. Y.

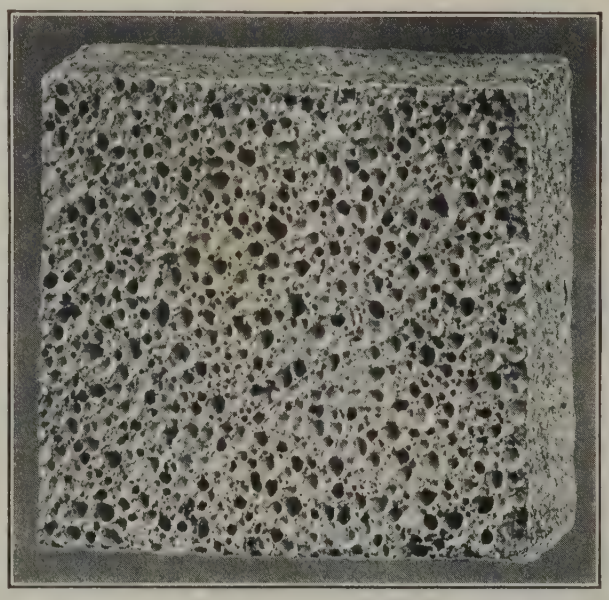
The above office will furnish information on request regarding promotion and manufacturing companies throughout the United States, Canada, South America, Europe and Australia

Aerocrete

Aerocrete is an aerated or expanded concrete made through a combined process of hydration and aeration. It is made from cement, fine aggregates, water, and in addition, to produce aeration, a specially prepared powder.

Properties

Proportions of mix as well as degree of aeration may be varied within wide limits, and properties will vary accordingly. Weight may be from 30 to 80 lb. per cu. ft., ultimate compressive stress from 200 to 800 lb. per sq. in. On account of aeration both heat and sound insulation values are exceedingly high. Adhesion to steel and masonry is excellent and impermeability for structural grades the same as for common concrete. Fireproofing qualities depend upon the quality of cement and aggregates; generally slightly superior to common concrete. Can be worked with most woodworking tools the same as common lumber.



Aerocrete Block Showing Actual Size Air Cells

Manufacture

Aerocrete is mixed and placed in the same manner as ordinary high grade concrete. The expansion is timed to take place in the forms and before initial set.

Aerocrete may be pre-cast or cast in the field—it may be cast in bulk or in individual forms. When Aerocrete is to be under heavy stress in bending, reinforcement may be added—steel bars for tension and concrete for compression. Any masonry finish products and even glass may be attached and perfectly bonded to Aerocrete.

Application

Structural Aerocrete—High compressive strength, specially waterproofed (if required), medium insulation. Used for:

(a) Building blocks with or without specially finished surfaces.

(b) Building bricks with or without special waterproofing; to be used with ordinary bricks for increased heat insulation.

(c) Complete pre-cast panels, with reinforcement and finish, and with steel window and door frames cast in place in the Aerocrete.

(d) Complete field-cast one and two-story residential walls, with reinforcement, finish, steel windows and doors, to be cast flat, raised and hoisted into position.

(e) Reinforced Aerocrete floor and roof planks, with or without concrete finish, cast in 2½ to 6-in. thicknesses in 8 to 12-in. widths for 3 to 12-ft. spans.

(f) Field-cast reinforced Aerocrete floor and roof slabs, with or without concrete finish in spans up to 12 ft.

(g) Reinforced pre-cast Aerocrete lintels, stairways and other specialties, with or without special finish.

(h) Aerocrete filler blocks for reinforced concrete joist construction with or without special top or bottom concrete finish for compression.

Fireproof and Insulating Aerocrete—Medium compressive strength, high insulation, specially waterproofed if necessary. Used for:

(a) Field-cast Aerocrete fireproofing for structural steel beams, girders and columns.

(b) Pre-cast Aerocrete fireproofing blocks, with or without reinforcement, assembled and grouted in the field.

(c) Partition blocks from 2½ in. up. Cost to place and plaster is low on account of very accurate dimensions and excellent bond.

(d) Furring blocks to prevent heat losses and condensation. Specially useful for the tropics. Heat loss for 3-in. block only .311 B.t.u. per hour per sq. ft. per degree F.

(e) Floor fill—with or without sleepers. Extremely light and highly insulating. This grade not to be recommended as a nailing concrete, but holds sleepers to perfection.

(f) Firestop blocks 4x8x14 in. to be used at floor levels of frame buildings.

(g) Cold storage insulation: Aerocrete for cold storage insulation can also be made with structural grade properties.

Cost of Aerocrete

Unit cost, obviously, varies with locality, availability of raw materials, labor conditions, extent of transportation necessary, and climatic conditions. It is generally below cost of concrete. For consistent use of Aerocrete even a high unit cost results in low over-all cost. This is due to a combination of properties seldom found in one material and resulting in simplified design and omission of supplementary materials and processes.

For tall steel frame structures as well as small residences—and anything between these extremes—the combination of distinct structural properties, exceedingly low weight, high insulating value, unusual fire resistance, adaptability and simplicity of erection result, therefore, in simple, ideal designs, simple and rapid methods of erection, elimination of troublesome and costly finishing processes, and, as a result of all this, an unusually low total cost.

Owners, architects, engineers, contractors and others interested in promotion of good engineering are invited to consult us regarding general development of Aerocrete as well as specific problems.

PORETE MFG. CO.

Manufacturers of Lightweight Concrete Products

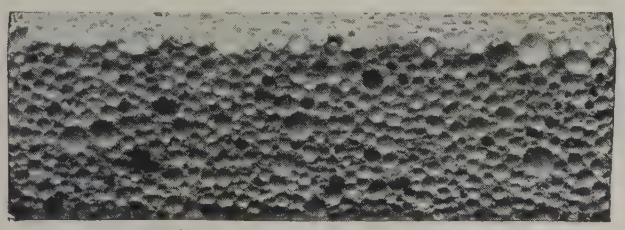
346 Riverside Avenue
NEWARK, N. J.

Product

PRECAST PORETE SLABS for roofs and floors.
RIB STEEL ROOFS and FLOORS.
PORETE-NAILFILL NAILING CONCRETE.
Also Cast-in-place Floor-fill and Fireproofing of Steel Beams.
Porete is covered by United States patents.

What Porete Is

Porete is portland cement concrete of uniformly honeycombed structure and combines the durability of concrete with the lightness of wood. It is made of portland cement and sand only. Porete is made of a very rich cement mix and the reinforcing metal is thoroughly coated and protected against corrosion.



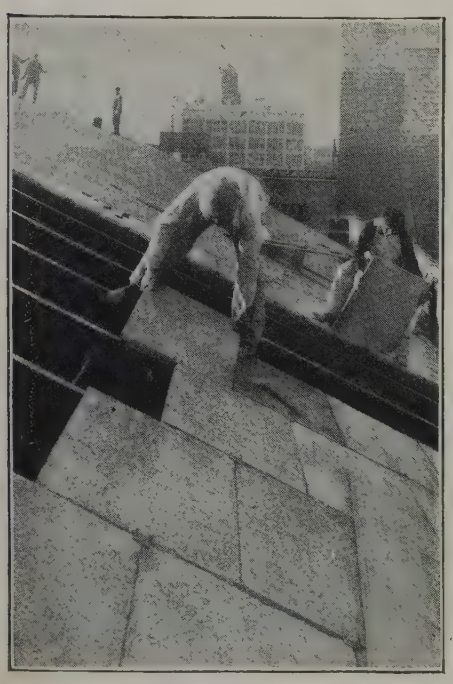
Full Size Structure of Porete

Porete has about one-third the weight of solid concrete.

On account of the air cells which it contains, it is a good heat and sound insulator and a better fire resisting material than solid concrete, because of its low heat conductivity. Its permanency is equivalent to that of concrete and its strength improves with age.

Porete Roofs—2 ft. 8-in. Span

Porete roof slabs, 24x32x1¼ in. thick, are laid on steel purlins at 2 ft. 8-in. centers and are fastened to them with heavy metal clips. After all the slabs are laid, a thin cement grout is worked into the rough surface and this roof deck is then ready for the waterproofing which is ordinarily a tar and felt roof.



Laying Porete Slabs

Porete for Steep Roofs, Used as a Base for Slate, Tile or Metal Roofing—Where slate, tile or metal roofing has to be nailed up, the Porete slabs are covered with ½ in. of Porete Nail Finish. This is a mixture of portland cement and sand with a fibrous fireproof mineral material. This finish forms a tough resilient sheet which becomes integral with the Porete, greatly adding to its initial strength.

Advantages—Porete roof slabs are a factory controlled product, accurately reinforced. In combination with a cement finish, which is applied in the field, they make a lighter fireproof roof than any other material. Porete roofs can be adapted to any roof design, flat or slanting. They are easily erected—even in cold weather.

They weigh only 7 lb. per sq. ft., which is one-half as much as any other fireproof roof. A Porete roof will carry a live load of over 50 lb. per sq. ft. with a factor of safety of five. Buildings covered with Porete will cost less to heat, because Porete is a good heat insulating material.

Porete roof decks present a clean smooth stone finish on the underside. Due to their light weight there is a saving in the steel of the supporting trusses, especially on the larger spans.

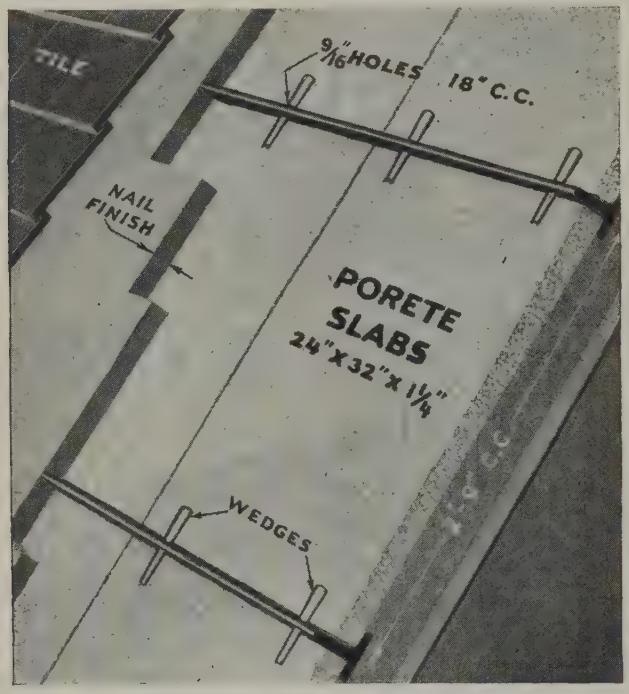
Savoy-Plaza Hotel, New York, N. Y.
McKim, Mead & White, Architects

For Steep Tower and Mansard Roofs—Porete has become the standard roof slab material on fireproof buildings.

The exposure of roofs to strong winds and the elements at great heights demands a roof-deck to which tile, slate, copper or lead roofing can be nailed with



On Very Steep Roofs Porete Slabs Are Laid in Tee Irons and Held Down with Steel Wedges

safety and with perfect assurance that the tile and slate will not be blown off.

Porete will give such a nailing base which is easy and economical to erect and which combines at the same time very light weight, strength and good heat insulating value.

The heavy finish which is applied in the field bonds the roof slabs into a monolithic sheet.

Porete Roofs on Pressed Steel Joists or Trussed Bar Beams

The joists can be set farther apart than in usual construction and 25% less steel is required.

The slabs are fastened to the joists with nails or wire clips. In combination with these joists Porete provides a good looking, strong, durable, lightweight concrete roof in which the reinforcing metal is well protected from rusting.

Porete Roofs—Long Span

Purlin Slab Construction—This is a combination of a 5 to 6-ft. long channel slab and the 2 ft. 8-in. span Porete slab. This roof is 1½ in. thick and weights 12 to 15 lb. per sq. ft.

Flat Slab Construction—Consists of 4 to 5 ft. long precast slabs provided with a finish coat in the field. Thickness of roof 2⅛ to 2⅝ in. Weight 11 to 14 lb. per sq. ft.

We recommend this roof where high insulating value is required.

For Longer Span Up to 10 Ft. we erect sub-purlins on 2 ft. 8-in. centers—either channels, I-beams, rails or other sections bolted or welded to the main beams as a support for the 2 ft. 8-in. slabs.

Rib Steel Roofs and Floors

Porete Rib Steel roofs and floors are constructed of ribbed, copper bearing steel sheets, 20 to 24 gauge, covered with a layer of solid concrete or lightweight, nailable, insulating concrete. The ribs formed in the steel sheets are designed as individual beams capable of sustaining the required loading of 40 lb. per sq. ft. The ribs are 1½ in. deep on standard and 2 in. deep on super sheets and are spaced 6 in. on centers.

These copper bearing rust resisting sheets are laid directly on structural steel purlins and securely fastened to the same with clips. After the sheets have been laid and fastened to the supporting steel, a 1-in. thick layer of lightweight insulating concrete is applied on top in plastic form, care being taken so that the depressions are entirely filled. After this layer of concrete is set, it will add additional rigidity and strength to the sheets.

Zee bar reinforcing rods are welded in the bottom of the ribs. These bars, when embedded in concrete, will serve as additional reinforcing and they also make a mechanical bond between the sheets and the concrete.

All steel sheets are painted in the shop as may be required for different classes of work.

The waterproofing on Porete Rib Steel roofs is done in the same way as on concrete roofs built up with felt and asphaltum.

Porete Rib Steel decks can be used on steep as well as flat roofs. When tile, slate, copper or other shingle type roofings are nailed direct to a Porete Rib Steel slab the minimum thickness of the slab should be 1½ in.

Advantages of Rib Steel Roofs—Rapid erection, lightweight for long spans, great strength and stiffness, permanency, good heat insulation value and very good appearance underneath.

If used on a floor there is an additional advantage that standard steel construction can be used with spans from 4 to 6 ft. The finished wood floor can be nailed directly to the Porete Nail Finish of the Rib Steel sheets.

Co-operative Service

It is advisable to consult the Engineering Department of Porete Mfg. Co. when laying out the steel for Porete roofs. Estimates for roofs will be gladly furnished.

An experienced force is always ready to lay roofs and floors anywhere in the United States.

Flex-Or-Crete

Flex-Or-Crete is a *fireproof permanently nailable concrete, light in weight* and possessing a *high compressive strength.* It is *non-corrosive, permanently resilient* and a *non-conductor* of sound and heat.

Nailing concrete is used instead of wood sleepers, screeds or nailing strips, and as a nailing base for floors, roofs, partitions and grounds. The nails are driven through the wood floors, slate, tile or metal roofing, directly into the nailing concrete.

Flex-Or-Crete is supplied in the form of powder, the ingredients of which, except cement, are specially prepared and mixed at our factory and shipped in burlap bags. When mixed with cement and poured in place, its surface resembles that of granolithic.

Approvals

Flex-Or-Crete has enjoyed over ten years' performance. It enjoys the endorsement of the leading architects and engineers, the Underwriters' Laboratories, Inc., National Board of Fire Underwriters, the Massachusetts Institute of Technology and Columbia University.

Qualities

Fireproof—Flex-Or-Crete is fireproof having stood as much as 3500° F. before any signs of disintegration appeared. (See Columbia University Test.)

Permanently Nailable—Regardless of its age it can always be nailed into and holds a nail better than the average grades of wood. Its resistance to the withdrawal of a nail is 60% greater than the average nailing concrete. It requires 540 lb. pull to remove a 3-in. nail driven 2½ in.

Light in Weight—It weighs 84 lb. per cu. ft., almost 50% less than rock concrete, reducing the dead-load by approximately one-half, and effecting a saving of 28% in steel.

Non-conductor of Sound and Heat—Flex-Or-Crete prevents the condensation of moisture common to concrete surfaces. It acts as a sound deadener between floors and is a non-conductor of sound and heat.

Permanently Resilient—Flex-Or-Crete has the resiliency of ordinary soft pine and a floor constructed of 2 in. on a concrete base covered with linoleum is silent and non-fatiguing, so essential in hospitals, libraries, schoolhouses, theaters, assembly halls and office buildings.

High in Compressive Strength—The average compressive strength of Flex-Or-Crete is 1200 lb. per sq. in. or approximately 70% of the strength of rock concrete and comparable to 1-2-4 concrete.

Non-corrosive—Flex-Or-Crete contains no injurious chemicals, does not cause decay or corrosion of metals, and eliminates the danger of cinder concrete which may generate sulphuric acid so destructive to pipes and conduits, also to linoleum and wood floors.

Verminproof and Sanitary—Flex-Or-Crete eliminates most of the cracks and small spaces common to ordinary methods of floor construction.

Forms an Excellent Bond—It bonds perfectly with concrete, tiles, cement block and brick, so that the floor is solid and not floating as is the case with screeds and cinders.

Application

Flex-Or-Crete is shipped in burlap bags, 26 bags to the ton. At the job one bag of cement is added to each bag of Flex-Or-Crete. Sufficient water is then added to produce a mortar of such consistency that it may be poured and screeded to a smooth, even surface. One ton (26 bags), when mixed with 26 bags of cement will cover 720 sq. ft. 1 in. thick or 360 sq. ft. 2 in. thick. No screening or measuring is necessary and the quality of the mixture never varies. During the setting of Flex-Or-Crete the temperature should not be more than 90° F.

Service

This Company will send a man to each installation when necessary, to instruct in the easiest and best methods of laying.

Uses

Fireproof, Structural, Nailable Roof Slabs—Flex-Or-Crete was designed especially for roof slabs where a decorative roofing such as tile, slate or copper is desired, and its light weight affords a saving in the steel. Its ultimate compressive strength, which is about 1200 lb. per sq. in. (higher than the best cinder concrete) allows spans up to 6 and 8 ft. for a 4-in. slab. In addition, it is one of the best fire retardants yet tested. The roof covering may be renewed and repaired at any time as Flex-Or-Crete is *permanently* nailable.

Nailing Base for Wood Floors—Flex-Or-Crete is poured and screeded to a smooth, even surface 2 in. thick over the structural floor with which it bonds perfectly, forming a resilient, quiet, durable, nailable base for the finished floor. No floor lining is necessary. It eliminates the time and expense in laying the screeds which often rot away within a few years and leave a dangerous point of weakness in the floor.

Metal Lumber Floors and Roofs—Flex-Or-Crete is used in combination with metal lumber for floors of light occupancy buildings. It is laid on metal lath with a thickness of 2 in., the metal lumber being spaced from 16 to 30 in. on centers. The use of Flex-Or-Crete instead of concrete with metal lumber eliminates the necessity of wooden screeds, and thus gives a continuous unbroken slab.

Continued on next page

Subfloors Under Linoleum—Linoleum laid on concrete is at times damaged by "sweating," "blistering," and "creeping," requiring expensive repairs after the work has been installed and considered complete. Apparently these defects are due to the relatively high heat conductivity of the concrete, causing the precipitation of atmospheric moisture. Linoleum has been laid on Flex-Or-Crete in many buildings and in not one instance have these defects appeared, for Flex-Or-Crete is a non-conductor of heat.

Ceilings and Partitions—Flex-Or-Crete may be plastered on metal lath for fireproofing, sound deadening, and as a nailing base for wood trim. Partitions constructed of Flex-Or-Crete receive directly nailed or screwed the mouldings, door jambs, baseboards, chair rail, picture moulding and other items, and eliminate the necessity of nailing strips, drilling and wood plugs which is the usual procedure in the average fireproof construction of partitions in modern buildings. It absorbs 50% less paint than ordinary plaster usually used in partitions.

Stucco—Flex-Or-Crete gives a very permanent product. Many architects prefer it for stucco, as it is particularly impervious to water, and sets very hard, thus providing an excellent permanent stucco.

Design—In the design of Flex-Or-Crete slabs the same formulas may be used as in the design of concrete slabs. The ultimate compressive strength for Flex-Or-Crete may be taken as 1200 lb. per sq. in. It weighs 7 lb. to the sq. ft. 1 in. thick or 84 lb. to the cu. ft., about one-half the weight of ordinary portland cement concrete.

Test Data

Complete information will be furnished on request regarding fire, load and water tests by Columbia University, Thermal Conductivity Test by Massachusetts Institute of Technology, Strength Tests by Massachusetts Institute of Technology, Compressive Tests by Columbia University, Nail Tests by Massachusetts Institute of Technology, etc.

Installations

Flex-Or-Crete Inc. will be pleased to furnish a list of installations, architects' references, cuts, literature or other information whenever requested.

Construction Department

Realizing the necessity of accurately following specifications we have organized our own engineering, estimating and construction departments. Our experience is at your service, assuring guaranteed construction under all conditions for which Flex-Or-Crete is designed.

We shall be glad to submit competitive bids, estimates, or recommendations.

Specifications

Note: Specifications for any particular job will be furnished by us on request.

Structural Slabs—(1) All roof slabs, including dormer and cornice slabs, shall be of Flex-Or-Crete, as manufactured by Flex-Or-Crete Inc., 1111 Statler Building, Boston, Mass.

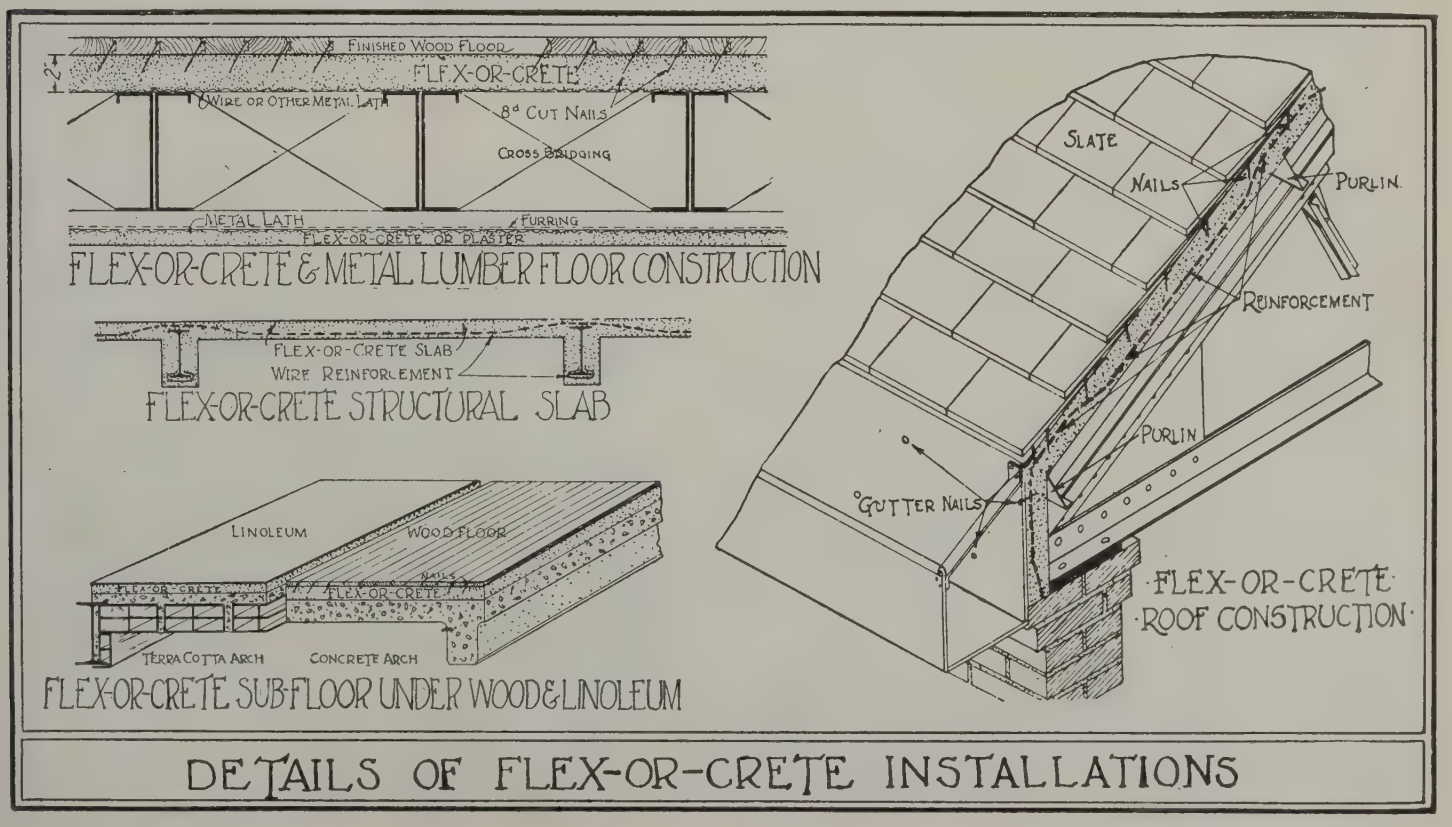
(2) Flex-Or-Crete shall be mixed in the proportion of one bag of cement to each bag of Flex-Or-Crete, and thoroughly mixed. Sufficient water shall then be added to produce a mortar that can be poured and screeded to a smooth even surface.

(3) The placing of the reinforcement and the forms is the same as for ordinary concrete. The forms shall be of sufficient strength to support the wet material and shall be tight enough to prevent loss. They shall remain in place until the Flex-Or-Crete has set, at least 10 days.

(4) The thickness shall be (..... in.) above mesh and (..... in.) below.

(5) The reinforcement shall be (state reinforcement).

(6) Where marked on plans the structural steel will be wrapped with (.....) reinforcement, and fireproofed with (..... in.) of Flex-Or-Crete.



THE NAILCRETE CORPORATION

Manufacturer of the Original Nailing Concrete

105 West 40th Street, NEW YORK, N. Y.

SELLING AGENTS IN ALL THE PRINCIPAL CITIES IN THE UNITED STATES

Product

NAILCRETE (Nailing Concrete). Patented—name registered.

NAILCRETE
PATENTED - NAME REG.

Nailcrete (Nailing Concrete)

Nailcrete is a cementitious, fibrous, *all-mineral* fireproof compound, containing no animal or vegetable matter, no acids, alkalis or any substance injurious to metals, wood or other construction materials coming in contact with it.

Nailcrete is regularly supplied in burlap bags containing in each case the correct quantity for the mix used. It is to be mixed on the job with portland cement, screened sand and clean water, and screeded smooth and level. Complete instructions with each shipment.

Origin

Nailcrete has been in successful commercial use for more than 20 years. It was developed after extended laboratory research and tests conducted by Grosvenor Atterbury, F.A.I. A., collaborating with the Russell Sage Foundation in connection with their economic construction developments.

Advantageous Qualities and Physical Properties

Nailcrete is absolutely fireproof and verminproof; will not shrink, swell, or rot; is unaffected by dampness, a poor conductor of heat and an effective sound-deadener.

Nailcrete has the same compressive strength as 1-3-6 cinder concrete and is 20% lighter (Nailcrete weighs about 90 lb. per cu. ft.) thereby saving steel in building design. Its nailing properties are unsurpassed, as Nailcrete holds nails better than pine.

Coefficient of expansion, also setting and drying periods are substantially the same as those of cinder concrete. Nailcrete calls for the same precautions against freezing, quick drying, etc., as are necessary with ordinary concrete.

NAILCRETE SLABS—SAFE LOADS IN LB. PER SQ. FT.

Gross sectional area of steel in sq. in. per ft. slab	Thickness of Nailcrete above steel	Span in feet									
		1½	2	2½	3	3½	4	4½	5	5½	6
⅜-in. Hy-Rib, Ribplex or equal, .061 sq. in.	2 in.	480	312	176	122	....	....	....	....	....	....
	2½ in.	....	....	232	161	118	91	....	....	....	....

Nailcrete weighs about 90 lb. cu. ft. or 7½ lb. per in., 1 ft. square.
Table based on WL/10. For WL/8 (or simple span), deduct 20% from above.
Brace self-centering lath to support wet Nailcrete.
Safe loads on spans above 6 ft. furnished on request.
Total live and dead load on tile roofs: 2-ft. slab, 66 lb.; 2½-ft., 70 lb.; 3-ft., 74 lb.; 3½-ft., 78 lb.; 4-ft., 82 lb. per sq. ft.

Uses of Nailcrete

Nailcrete is used without sleepers and without underflooring or sheathing, and is more durable than the ordinary construction using wood sleepers and cinder-concrete fill. It is especially suitable as a fireproof nailing base for floors, roof covering of various kinds, etc., as follows:

(a) Subfloors—Nailcrete is laid 2 in. thick (weight about 15 lb. per sq. ft.) as a subfloor on top of the structural slab or floor arch, to which is directly applied wood flooring, cork tile, etc., giving the floor greater resiliency and making it more impervious to sound. (See specifications.)

(b) Reinforced Floor Slabs for Metal Lumber—Nailcrete is used 2 in. thick on top of metal lath placed on metal lumber or bar joist floor beams. In this case the Nailcrete acts as fireproof floor slab and as a nailing base for the finished wood floor. (See specifications and table of safe loads.)

(c) Roof Coating—A fireproof, rotproof nailing base 1½ to 2 in. thick directly on top of roof slab to receive tile, slate, copper, etc. (See specifications.)

(d) Reinforced Roof Slab—A poured-in-place construction on rafters of steel, metal lumber or bar joists. (See specifications and table of safe loads.)

(e) Nailcrete Floor-Fill—Under cement finish, terrazzo, marble, tile, etc., as a non-corrosive fill in place of cinder concrete. (See specifications.)

(f) Plaster, Interior and Exterior—For interior plastering especially for fireproofing, sound-insulating and as a nailing base for wood paneling; for exterior plastering of penthouse walls, skylight curbs, etc., to receive the sheet metal covering. (See specifications.)

Cost

Nailcrete installed costs less than good wood sleeper and cinder-concrete fill construction. (Estimates furnished by all contractors.)

Service and Supervision

Where practicable, THE NAILCRETE CORPORATION will send a representative to the job, without expense to the contractor, to instruct users in the proper installation of Nailcrete.

References

A list of Nailcrete installations will be furnished on request.

Specifications for Nailcrete

Note: Always specify Nailcrete by name.

Materials—Nailcrete shall be made with portland cement and sand strictly in accordance with the specifications of the manufacturer. All sand shall be sharp, clean, and screened through ¼-in. mesh.

Preparatory Work—Immediately before Nailcrete is laid, the surface to be covered shall be swept broom-clean, thoroughly wetted and grouted.

Setting—All Nailcrete shall be allowed to set properly before being walked on.

Note: Ordinarily 2 days in summer and 3 days in winter.

Nailcrete Subfloors—On structural floor construction Nailcrete shall be laid 2 in. thick and screeded, and, if necessary, troweled, to a level.

The wood floor is not to be laid until the Nailcrete has thoroughly dried out. Flooring to be nailed with 8d cut nails, driven at an angle of approximately 45°.

Note: For high class work specify (under the heading of Carpentry) 1 layer of tarred paper (not less than 2-ply) additional deadening felt, if desired, and the finish wood flooring to be used. *Under-flooring* is *never* necessary.

On Metal Lumber Beams—Cover the floors of rooms, etc. (specify which ones are to be covered), with metal lath secured directly to the beams (not over 2 ft. apart) and on top of the metal lath put a bed of Nailcrete not less than 2 in. thick at the thinnest point, screeded level to receive the finish flooring specified under Carpentry.

Note: In high class work specify paper as above. Even in work of the highest class underflooring is unnecessary.

Nailcrete Roof Coating—The structural roof construction shall be covered with 2 in. of Nailcrete.

Note: If slate are thicker than ¾ in., consult The Nailcrete Corporation as to the thickness of the Nailcrete.

Reinforced Sloping Roof Slab—Cover steel rafters with self-centering lath (as specified by manufacturers) or pour in place fabric-reinforced Nailcrete slab ..... in. thick. (See table for areas of steel and safe loads.)

Nailcrete Floor-Fill—Over structural arch apply ..... in. Nailcrete Floor-Fill in accordance with manufacturer's specifications.

Plaster—***Interior***—Plaster interior walls to an approved finish, true and even as per instructions of The Nailcrete Corporation.

Exterior—Plaster the exterior of penthouse walls, skylight curbs, etc., with Nailcrete plaster 1 in. thick in 2 coats, scratch and finish, troweled (or floated) true and even.

Note: If the Nailcrete plaster is to be applied to gypsum blocks, the blocks should be covered first with proper bonding material, and the Nailcrete is then to be applied while the bonding material is still tacky.

Blawsteel Galvanized Roof Sheathing

Blawsteel Galvanized Roof Sheathing is impervious to moisture and is light in weight and low in cost. It can be erected in less time than other types of roof sheathing and allows building construction to be carried on almost without a break, regardless of weather conditions. Rain or snow can be swept off the sheathing, or moisture wiped off and insulation applied in any weather. This makes Blawsteel Galvanized Roof Sheathing particularly desirable and economical for use on all buildings designed for flat roofs, a fact that is being widely recognized by architects, contractors and owners.

Blawsteel Galvanized Roof Sheathing has an expansion joint every 4 in. in the length of the building, and roofing placed on this steel sheathing is not subject to strain caused by expansion and contraction. It forms a more elastic support for roofing than other types of sheathing. It is weathertight and rustproof and can be easily protected against inside deterioration from injurious gases by using acidproof paint.

Any of the tried and tested insulating materials can be used on Blawsteel Galvanized Roof Sheathing, together with any type of roofing material that is specified by architect, engineer or owner. Asphalt (and not tar), however, must be used in mopping insulation to steel sheets.

Safety with Economy—Blawsteel Galvanized Roof Sheathing is non-burnable and therefore particularly desirable where specifications absolutely eliminate the use of wood. The advantages of having a non-burnable roof are so obvious that they need not be taken up in detail. With the use of Blaw Galvanized Roof Sheathing, insurance rates are greatly reduced; in some instances sufficient to more than pay the interest on the investment. In addition to its non-burnable qualities, steel sheathing will not disintegrate under the action of fumes or gases, and cracks cannot develop owing to expansion and contraction caused by temperature changes.

Weight—Weights of Blawsteel Galvanized Roof Sheathing and other types of materials are given below:

Weight of three-ply "A" specification prepared roofing with ½-in. insulation on Blawsteel Galvanized Roof Sheathing .... 5 lb. per sq. ft. Weight of wood roof, 1⅞-in. tongue and groove with three-ply prepared roofing, about 10 lb. per sq. ft. Weight of 2-in. gypsum roof, including T bars with three-ply roofing, about 15 lb. per sq. ft. Weight of 2-in. concrete roof with three-ply prepared roofing, about 27 lb. per sq. ft.

Pitch—Roof pitch for Blawsteel Galvanized Roof Sheathing is ¼ to ¾ in. per ft.—½-in. per ft. is standard.

Purlins—Blawsteel Galvanized Roof Sheathing is ordinarily placed on standard structural channels. Usual bay spacing requires 7-in. 9.8-lb. channel purlins spaced 3 ft. 10½ in. between centers for 40-lb. live load. Increased load or bay length would require 8, 9 or 10-in. channels, depending on load and spacing.

Blawsteel Sheathing—Blawsteel Galvanized Roof Sheathing consists of copper bearing, galvanized sheets, with longitudinal integral reinforcing ribs pressed into the sheet on 4-in. centers.

Installing Blawsteel Sheathing—Blawsteel Standard Flat Roof Sheets shall be laid (starting at the eaves of the building) and ribs shall be placed downward, resting on purlins—with flat side up. Sheets are placed so that ribs fit into grooves in wood filler in eave cornice. The sheet metal cornice is then nailed down through end of sheet, by driving galvanized nails into wood core. Sheets are interlocked at sides. As sheets are placed they are fastened to eave purlins by means of special anchors provided for this purpose. Anchors are placed at toe of purlin, one in center of each 20-in. wide sheet and one at side sheet joint.

After first course of sheets is in place, the second course is started, lapping 3 in. on first course—the ribs of the second course telescoping with the ribs of first course. Anchors are then placed every 10-in.—one in center and one in joint of all sheets at lap—which occur over the purlin.

Each course of sheets is placed likewise until ridge is reached—over the sheets at ridge a 12-in. wide and 10-ft. long ridge cap is placed and fastened to sheets with four metal screws.

Cleaning—After sheets are all in place and anchored securely, and before insulation or roofing is applied, sheathing shall be swept clean of all debris or dirt, and the entire surface mopped with dilute acetic acid or vinegar.

Laying Sheets in Place

Ready for Insulation and Roofing

SYRACUSE OFFICE, 136 Walton Street
PHILADELPHIA OFFICE, 1015 Chestnut Street
DALLAS OFFICE, 410 Construction Industries Building

Product

HOLORIB REINFORCED STEEL ROOF PLATES, a strong, rigid form of integral reinforced roof construction, forming the permanent base of a completely insulated and waterproofed unit.

HOLORIB ROOF UNIT
Deck-Insulation-Waterproofing

Service

A Holorib Roof is designed by Holorib engineers for the building on which it is to be applied in co-operation with the architect and engineer. HOLORIB INCORPORATED produce the steel sheets, metal edging, backing or closures, fastening clips, and (1) will contract to erect the steel deck with their own field force, or (2) furnish superintendence at a moderate charge, so that the deck may be applied by the general contractor, or (3) will co-operate with responsible and capable roofing contractors so that the architect and owner may be relieved of all responsibility for the permanent satisfaction and stability of the complete roof unit.

HOLORIB INCORPORATED recommend that insulation always be applied over their steel roof deck. As a result of our experience, we prefer the pressure resisting or rigid types of insulating material. We further believe that the interest of the owner and architect is best served by the use of good quality waterproof coverings, and will be glad to furnish suitable specifications if so requested.

Holorib engineers are thoroughly familiar with structural design and their services in laying out the most economical framing plans for roof decks are at the disposal of architect and owner.

Construction

Holorib Deck Plates are fabricated from copper-bearing steel sheets reinforced by self-contained closed triangular ribs rolled into the sheet longitudinally, each rib forming a complete girder beam that rests directly on the purlins and anchored to them by specially formed anchor clips. The sheets dovetail and interlock securely together on both sides and ends, forming a deck through which there is no possibility of asphalt drippage.

Directly upon the Holorib Steel Roof Deck the correct thickness of pressure resisting insulation is full mopped in hot asphalt. Complete adhesion and thorough waterproofing is assured as the upper surface of Holorib is continuous, smooth and level. The built up waterproofing is then mopped to the dry insulation, forming a complete weathertight unit.

Holorib Steel Roof Deck construction is applicable to flat, pitched, or curved roofs, and the proper gauge Holorib sheets are fabricated for those purlin spacings which are the most economical in the use of structural steel.

Standard 24-gauge Holorib sheets are rolled with triangular ribs ¾ in. deep spaced 3¼ in on center. They are specially designed for structural purlins or light joists spaced under 5 ft. Wide span Holorib sheets are fabricated from 22 and 20 gauge copper-bearing steel with triangular ribs 1½ in. deep spaced 6 in. on center, and will cover with unusual rigidity purlin spacings as high as 8 ft.

All Holorib sheets are dip coated and oven baked at the factory with a steel gray finish forming a tough protective film not readily abraded in shipment, which is, in addition, a first class base for a field coat. With the application of this field coat following erection, no maintenance work will be necessary, except under very unusual conditions, and the steel ceiling will not require any more attention than that given the structural members during future years.

The Holorib Steel Deck is fireproof, and the complete unit itself rates as incombustible.

The Insulated Roof Unit

The insulation as applied to Holorib Steel Deck Plates effectively retards the passage of heat in either direction. In this respect, the Holorib Roof Unit with 1 in. of insulation is equal to 24 in. of solid concrete in heat retarding value. This effective insulation very definitely reduces fuel consumption year after year, and may well be taken into account in designing new buildings by reducing the amount of radiation and size of the heating plant.

Dry steel never rusts. The insulation applied over Holorib entirely prevents condensation from warm air within the building meeting a surface chilled by a colder exterior temperature, with the result that the Holorib Roof Deck always remains at approximately room temperature well below the dew point of the interior air. Accumulation of moisture due to condensation is totally absent.

With the steel deck ceiling protected with paint from below and insulation above, no injurious corroding action is possible.

Without the use of insulation a steel roof deck is no more permanent than any copper-bearing steel sheet. *With* insulation the Holorib Steel Deck is placed in exactly the same position as any metal furniture, such as filing cabinets, steel desks, metal trim, etc., contained *within the building.*

With high humidities and temperatures, from 1½ to 2 in. of insulation should be applied in broken joint construction. The ceiling should be given two field coats of good paint.

In the average heated building, such as theaters, schools, auditoriums, machineshops and garages, a 1-in. thickness of insulating material will return a substantial dividend in fuel saved annually, and will entirely prevent the possibility of condensation.

In slightly heated buildings where cost is the chief factor and there is little likelihood of a considerable temperature difference within and without the building, a ½-in. layer will prove satisfactory. In all installations at least one field coat of paint should be applied to the ceiling.

Final waterproofing is accomplished by means of built-up felts with a surface finish of slag, gravel, or asbestos, or a 4-ply built-up asphalt roof. Slate or tile has been permanently and successfully applied on steep Holorib Roofs, and on such surfaces the first layer of insulation is both mopped and fastened to the Holorib with sheet metal screws and 1-in. washers; the second ply is then mopped and nailed to the first layer, and over this surface is mopped an asphalt saturated sheet, the slates are then nailed directly into the insulation, using barbed copper nails.

Special specifications resulting from our experience covering roofs of this type will be furnished upon request.

Continued on next page

Comparative Insulating Values

The thermal conductivity of roofs *with built-up waterproofing* are expressed in B.t.u. per hour, per degree difference. (From 1928 edition of the American Society of Heating and Ventilating Engineers Guide.)

Holorib with ½-in. insulation	0.358
Holorib with 1-in. insulation	0.232
2-in. concrete	0.658
3-in. concrete	0.610
2-in. wood (new, not shrunken or warped, full, *not* commercial thickness	0.345
3-in. poured gypsum with 15% wood fiber and plaster board base	0.369
4-in. poured gypsum mixed with 15% wood fiber and plaster board base	0.318
Corrugated asbestos, per *inch* thickness	0.48

Steel Saving

The Holorib Insulated Roof is one of the lightest permanent decks in existence, and structural members may be considerably reduced in weight. The saving in steel is frequently measured in tons with a corresponding reduction in building costs.

Comparative Roof Weights

Holorib:	Lb. per sq. ft.
Waterproof covering	1.5
1-in. insulation	1.5
Steel deck	1.6 to 2.9
Total approximately	5 lb.
2-in. plank	8
3-in. plank	11
3-in. gypsum	18
Precast concrete	18 to 25
3-in. poured concrete	38

Add 4 to 6 lb. per sq. ft. if slag or gravel is used.

Advantages

The Holorib Roof unit is always a permanently weathertight roof. The insulation can be kept dry and applied in that condition. The waterproofing membrane thoroughly cemented to *dry* insulation is unusually free from wrinkles and gas pockets, and will remain in good condition many years longer than over many other types of roof decks.

Contraction and expansion in the roof unit is practically eliminated. The steel deck is not affected by temperature or atmospheric changes.

Rates as fireproof over incombustible contents, and very often affords a reduction in insurance rates.

Speeds up completion of the building. On an average job, four men will apply 25 squares of steel deck per day.

The inside appearance is very attractive, no dust can collect on ribs.

Is *lower* in cost than other types of fire resistive construction *with the same insulating efficiency.*

General Information

Holorib Sheets will be cut to special lengths at the factory, but widths cannot be varied. Irregular shapes and angles to fit valleys, ridges, etc., are cut in the field. This work is rapidly accomplished with oxy-acetylene using a fine cutting tip, or an electric saw with hardened steel blades, or a nail saw.

Holorib may be applied on sidewall and curb construction under monitor sash. Special detailed drawings upon request.

All sheets must have a bearing at the ends of a building either raggle, corbel, or purlin. We furnish single starting sheets for the sides of the building. Overhang should be 8 in. or less at the ends of the sheet, but must be supported at the sides or gable end. All end laps of Holorib Sheets are made directly over, or within 6 in. of the purlin, without sacrifice of appearance or rigidity. Closures for ridges, valleys, gables, or eaves are generally furnished by the sheet metal and roofing contractor as they are applied over the insulation. Unless specifically stated they are not included in Holorib quotations. We will furnish a Holorib layout from dimensioned architectural drawings and steel plans. There is no charge for this work.

IRONCLAD, INC.

Ironclad Insulated Copper Steel Roof Decks

817 14th Street, N. W.
WASHINGTON, D. C.

Ironclad Roofs—Quickly Laid at Less Cost

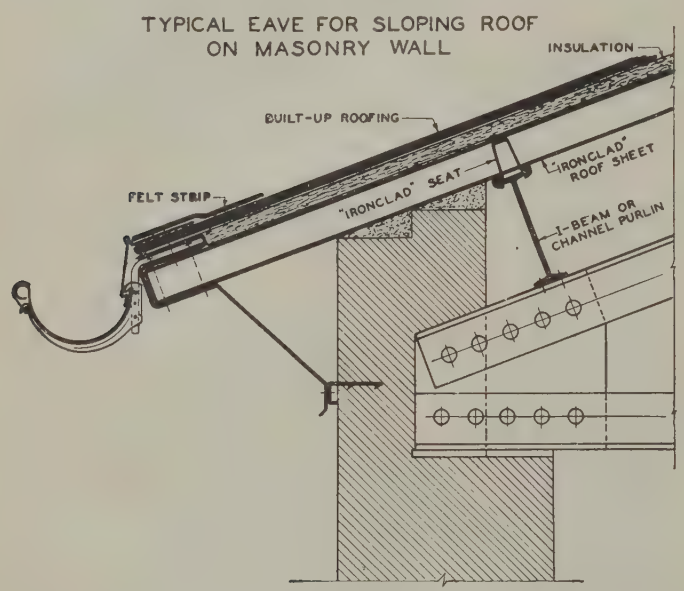
Ironclad Copper Steel Roof Sheets form an exceptionally strong metal roof, spanning approximately 6 to 8 ft. between purlins, and being practically as cheap in place as good wood construction.

Ironclad Copper Steel Roof Sheets are strong and durable. They provide ample support for a generous thickness of insulating material. The permissible longer spans between purlins (approximately 6 to 8 ft.) and the light weight of Ironclad (approximately 7 lb. per sq. ft. including steel purlins) effect substantial savings in the cost of the supporting framework.

Steel roofing, because of its strength, economy in cost, fire resisting qualities and long lived service, has earned merited recognition in all types of construction.

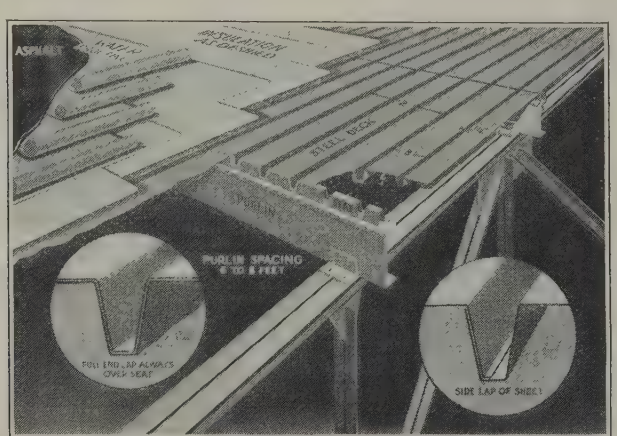
Ironclad for All Types of Roofs

Ironclad Copper Steel Roof Sheets are adaptable to any type of roof, regardless of the pitch. They have been most successfully used for roofing theaters, hospitals, industrial buildings, hangars, etc.. Ironclad may be used on flat, sloping, gable, hip, French, sawtooth and special types of roofs.



Advantages of Ironclad Roofs

Spans—Ironclad will span from 6 to 8 ft. between purlins, requiring a very small amount of structural support per square foot of roof.



Construction Details of Ironclad Roof

Weight—Due to its deep rib and effective seat, Ironclad is very strong but light in weight.

Expansion and Contraction—The effective methods of fastening Ironclad distribute expansion and contraction over the entire roof area uniformly.

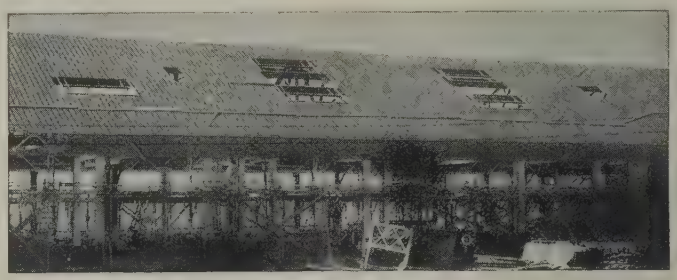
Permanency—Ironclad is made of rust resisting copper steel with a baked-on coat of paint, or can be supplied in galvanized copper steel.

Unusual Conditions—Ironclad fastening clips and other appurtenances take care of even unusual conditions.

Economy—Ironclad Roofs are practically as cheap in place as good wood construction. They are easily and quickly placed, effecting a saving in time and labor. Light weight and longer span save money on framing.

Ironclad Used as Siding

Ironclad Copper Steel Roof Sheets can be used for siding and, due to their rigidity, save steel or other supporting material. Metal screws and washers are furnished to hold the insulation or wood nailing strips for slate or tile on vertical surfaces.



Ironclad Used on Sloping Roof

Designing Information

Ironclad Copper Steel Roof Sheets are furnished in 24, 22, 20 and 18 gauge. Each sheet is 2 ft. wide and lengths are 5, 6, 7 or 8 ft. and lap is optional but should not be less than 1 in.; consequently each Ironclad sheet covers a roof area equal to its own length in feet less 1 in. (or the lap allowed) multiplied by 2 ft., or the full width of the formed sheet. Ribs are full 2 in. in depth, spaced 8 in. center to center. The seats are 2¼ in. in depth so the distance from top of purlin to top of deck is 2¼ in. plus thickness of sheet used.

Specifications

Roof Sheathing—The roof sheathing shall be Ironclad Copper Steel Plates with ribs not less than 2 in. deep or more than 8 in. from center to center of ribs. The plates shall be supported by pressed copper steel seats securely held to the purlins. All joints shall come over supports. The ribs shall be formed with bends not exceeding 90° and all corners shall have a radius of not less than twice the thickness of the sheet. The sheet shall be fastened to the pressed steel seats with clips or other suitable means permitting expansion and contraction without deformation of the sheet. The sheets shall overlap at the ends for their entire width and depth, not less than 1 in. and for their entire length not less than the depth of one rib.

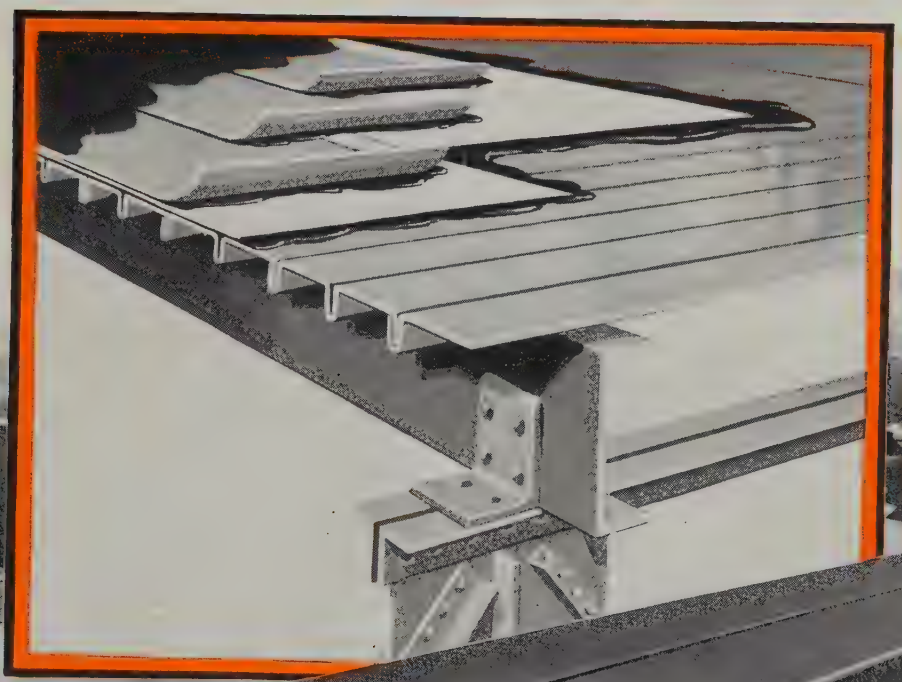
The sheets shall be made of ..... gauge metal to fit purlin spacing of .... feet .... inches. Sheet material for the roof shall be coated with a baked-on shop coat of preservative paint.

Insulation—The sheathing shall be insulated with ..... of a thickness of not less than ..... embedded in high temperature asphalt, and on slopes over 3 in. to the foot shall be fastened with metal screws and washers, using not less than one screw for each 4 sq. ft. of insulation.

Waterproofing—(Usual type of specification.) If slate or tile roofing is to be placed over the insulation, suitable nailing strips shall be fastened through the insulation into the roofing sheet with metal screws.

MAHON

STEEL ROOF DECK



THE R. C. MAHON COMPANY

DETROIT, MICHIGAN

THE R. C. MAHON COMPANY

Manufacturers of the Mahon Steel Roof Deck

HOME OFFICE AND PLANT

DETROIT, MICH.

BRANCH OFFICES: NEW YORK, N. Y., AND CHICAGO, ILL.

Product

MAHON STEEL ROOF DECK.

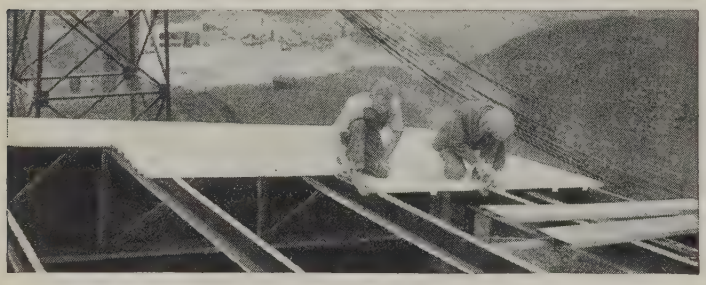
For Fire Doors, see page A963; for Roof Sumps, see page C2789.

Mahon Steel Roof Deck for Every Type of Roof

The Mahon Steel Roof Deck, details of which are set forth in these pages, offers a roof suited to practically any type of building calling for either flat, pitched or arched roof construction.

Architects and contractors will find that the Mahon Steel Roof Deck greatly simplifies roof design, and builders will appreciate the ease with which the roof can be applied. It has advantages in structural simplicity which permit rapid erection and consequently lower the cost of construction—a feature that wins approval of building owners everywhere.

The laying of a Mahon Steel Roof Deck is one of the simplest structural operations that you have ever



Mahon Steel Roof Deck Is Easily and Quickly Laid

witnessed. The work, due to the ingenious design of parts, can proceed swiftly and is done entirely from the upper side of the roof. Every plate of a Mahon Steel Roof Deck fits into the preceding unit. There are no end fittings—the ends being lapped one over the other. All lap joints occur directly over purlins. All clips are installed from the top as the plates are put in place.

The Mahon Steel Roof Deck consists of one standard roof plate and three standard clips by which the plates are fastened together and to the supporting framework.

Material

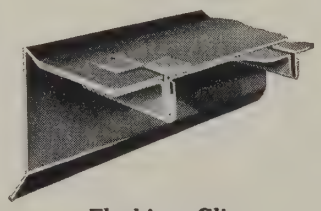
Mahon Steel Roof Deck is furnished in 18 and 20 gauge, in copper bearing or galvanized steel. Mahon has established 20 gauge as a minimum thickness of steel for roof deck plates as a result of exhaustive tests which indicate this as the minimum that can be safely and economically utilized. Weight impacts would be likely to seriously affect lighter gauge material.

Standard Assembling Clips

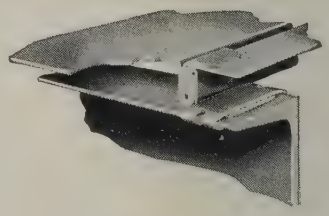
The laying of a Mahon Steel Roof Deck requires only the installation of the steel clips by which the plates are fastened together as they are assembled, and by which they are fastened to the supporting structural steel. Mahon clips have been designed primarily for simplicity, and they have in every instance a strength more than adequate for the work they are called upon to perform.

Mahon Standard Steel Roof Deck Plate

Intermediate Clip Locking Roof Deck Plates Together Midway Between Purlins

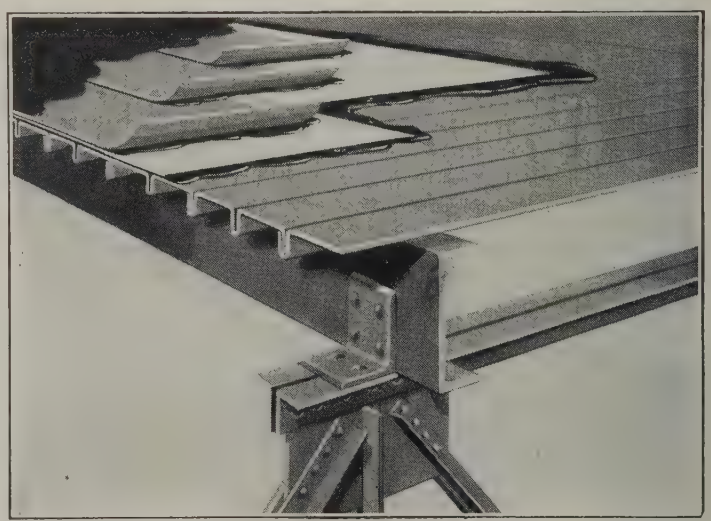


Flashing Clip for Attaching Flashing to Roof Deck Plates



Beam or Purlin Clip for Attaching Roof Deck Plates to Beam or Channel Purlins

There is not in the design of the Mahon Steel Roof Deck any part which can work up, become loose or in any way act to rupture the insulation or roofing material.



Cross Section of Mahon Steel Roof Deck Showing Application of Insulation and Waterproofing

Continued on next page

An Integral Unit Roof

The Mahon Steel Roof Deck installation, when completed, functions as a single steel plate, the separate units becoming an integral part of one interlocking whole when assembled.

A feature of the Mahon Steel Roof Deck which makes for extra rigidity and strength is the making of all end lap joints directly over purlins. The minimum end lap is 2 in. No unsightly laps or joints are visible from the underside of the Mahon Deck.

All plates in the Mahon Deck lay 12 in. wide when installed, ribs 1½ in. deep are 6 in. on centers. Every second rib where the sheets interlock provides three thicknesses of metal. Each deck plate is locked with special clips to the adjoining plate midway between purlins to prevent sagging of individual plates due to weight when the same weight is not exterted on those adjoining. This feature eliminates the possibility of loosening the bond between insulation or roofing applied to deck.

Universal Application

The unusual lightness of the Mahon Steel Roof Deck fits it for use on buildings of every type, including buildings with unusual roof spans such as auditoriums, gymnasiums, and the like. Designers will also find this type of roof deck admirably suited to factories, office buildings, hotels, apartments, hospitals, and schools.

Mahon Deck on a South Bend, Ind. Theater

The fact that a Mahon Steel Roof Deck can be insulated to exactly the degree required for the type of occupancy makes it an ideal construction for any type of building.

Expansion and Contraction

Expansion and contraction difficulties have been entirely obviated in the design of the Mahon Steel Roof Deck. Note in the center rib an ample allowance for lateral expansion and contraction, and also that longitudinal expansion and contraction of the plate is provided for in the lap joints.

These factors mean that bulging positively cannot occur in a Mahon Steel Roof Deck, and that no injury to insulation or composition roofing can occur through expansion or contraction.

Mahon Deck Used for Both Roof and Floor of a Conveyor Shaft

Monitor Flashings

The projecting ribs on the plates of the Mahon Steel Roof Deck can be cut and the sheet turned up to make a flashing under monitor windows, curbs, etc.

Saddles and Fill

Where saddles are required, any material which is of a permanent nature may be used. We have carried on a number of tests and believe gypsum to be the best material which has been brought to our attention up to the present time. We, therefore, recommend the application first of one layer of asphalt or tarred felt on the steel deck proper, the same to be cemented to the deck with asphalt or pitch. This should be mopped on top with asphalt or pitch over which the gypsum may be installed. Gypsum should then be allowed to dry before roofing is applied. Since gypsum is an insulator in itself, we suggest stopping the insulation at the gypsum line.

Caution—If a cinder fill is to be used, under no consideration should it be laid next to the steel deck. The sulphuric content of cinders is detrimental to steel, and for the protection of the deck where cinders are to be used we would recommend at least two plies of roofing felt laid with pitch or asphalt over areas of the deck to be covered with cinders.

Insulation

The Mahon Steel Roof Deck is a complete structural unit, and requires no insulation for stiffness or rigidity—these factors being amply provided for in the deck itself. In the case of unheated structures such as loading docks, warehouses and the like, insulation is not necessary. In buildings that must be heated or where condensation is a problem we recommend the use of insulation of any approved type—amount of insulation will be governed by the type of occupancy.

Mahon Deck Covers New Extension to Arvey Corp. Plant, Detroit, Mich.

Composition Roofing

Any standard composition roofing can be used over the Mahon Steel Roof Deck. Asphalt roofing may be preferable from a standpoint of weight. Sheets should be mopped solid similar to roof construction over concrete.

Fire Safety

No matter what type of occupancy a building is designed for, building codes in centers of population demand fire safety. Mahon Steel Roof Deck provides the utmost in fire safe roof construction, and will obtain for the owner a low insurance rate.

Continued on next page

Specification for Mahon Steel Roof Deck

(A) **Work Included—**

All roof surfaces shown on plans as steel deck.

(B) **General—**

Steel Deck shall be as manufactured by The R. C. Mahon Company, 8650 Mount Elliot Avenue, Detroit, Mich., or equivalent, meeting fully this manufacturer's standard of quality.

(C) **Materials—**

(C1) ***Deck Plates—***

(C1a) Deck plates shall be of copper bearing steel painted one shop coat of metallic paint.

(C1b) *Alternate*—Deck plates shall be of galvanized steel furnished unpainted.

Note: Select either (C1a) or (C1b) as desired.

(C1c) Deck plates shall not exceed 12 inches in width reinforced with webs or ribs not less than 1½ inches deep spaced not to exceed 6 inches on centers, so constructed as to allow for expansion and contraction.

(C1d) Minimum gauge of steel for plates shall be 20 gauge for spans up to and including 7 feet, and 18 gauge for spans over 7 feet up to and including 8 feet.

(C1e) Deck plates shall be capable of withstanding a distributed live load of 40 pounds per square foot without permanent deflection on the above maximum spans.

(C2) ***Attachment Clips—***

Furnish steel slips adapted to permanent attachment of plate ribs to each roof purlin spaced 12 inches on centers. Furnish interlocking clips for securing adjoining deck plates together midway between purlins.

(D) **Erection—**

All end laps of deck plates shall be made directly over roof purlins, with a minimum overlap of 2 inches.

Deck plates shall be secured to each purlin every 12 inches on centers by steel clips fastened to the deck ribs.

Each deck plate shall be secured to the adjoining plates by interlocking clips set midway between purlins.

Note: These interlocking clips create lateral continuity and prevent one sheet from deflecting below the level of those adjoining.

Engineering Data

Light Weight—

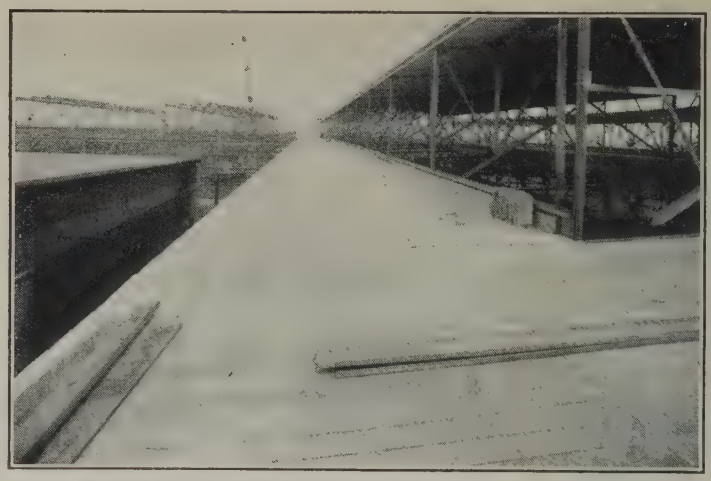
As indicated before, the weight of Mahon Steel Roof Deck is such that it permits considerable economies in construction. The Mahon 20 gauge deck weighs 2.5 pounds per square foot and the 18 gauge deck weighs 3.25 pounds per square foot. The total weight of roof will depend on the type and amount of insulation and the type of roofing material used.

Deflection—

Load tests for deflection carried out by the Perry Testing Laboratories, Detroit, Mich., on the Mahon Steel Roof Deck with live loads of 30 and 40 pounds per square foot showed no permanent deflection in either 18 or 20 gauge deck.

Thousands of Square Feet of Mahon Steel Roof Deck Are Utilized in This Building

Millions of square feet are now in use on various types of buildings



Another Application of the Mahon Deck on an Industrial Building

DEFLECTION IN INCHES—18 GAUGE—NO INSULATION

Copper Bearing or Galvanized Steel

Mahon Steel Roof Deck Plates can be furnished in copper bearing or galvanized steel in either 18 or 20 gauge in any length up to 12 feet 4 inches.

Standard plates carried in stock in 20 gauge for immediate shipment in lengths of 4 feet 2 inches, 5 feet 2 inches, 6 feet 2 inches, 7 feet 2 inches, 8 feet 2 inches, 10 feet 4 inches.

The 18 gauge is carried in stock in lengths of 8 feet 2 inches only.

Purlin Spacing

The 20 gauge deck plates are not recommended for purlin spacings exceeding 7 feet. Maximum purlin spacing for 18 gauge deck plates 8 feet.

STANDARD DECK PLATES RECOMMENDED FOR VARIOUS PURLIN SPACING

Purlin spacing	Plate lengths
to 4′-0″	8′-2″ or 12′ 4″
4′-0″ to 5′-0″	5′-2″ or 10′ 4″
5′-0″ to 6′-0″	6′-2″ or 11′-6″ or 12′-4″
6′-0″ to 7′-0″	7′-2″
7′-0″ to 8′-0″	8′-4″

TRUSCON I-PLATES
PATENTS PENDING
Insulated and Waterproofed

The Importance of the Right Roof

When choosing a roof design, occupancy conditions, heating, ventilation, humidity—both exterior and interior—and geographic location must be considered. The right roof must be practicable in design and purpose. The right roof must successfully protect against the elements of wind, water and fire. It must be flexible, firm and free from inherent movement caused by expansion and contraction. It must be economical. It must harmonize in its details with the structural supports.

Steeldeck Roofs of Truscon I-Plates are of a broad and general usefulness. They meet all requirements and conditions, and are particularly adaptable to theatres, gymnasiums, auditoriums, public halls and many industrial buildings requiring large floor areas free from supports and obstructions.

Truscon I-Plates Design

The I-Plates type of Steeldeck is a roof deck so formed that each plate is a unit capable of carrying the specified loads between the members of the roof structure.

I-Plates are manufactured from Nos. 18 and 20 gauge copper-bearing steel with I-Sections formed on the bottom side longitudinally. On one edge a complete I-Section is formed, on the other edge a turned down flange of about ½ in. is provided, to fit into the edge I-Sections of adjacent I-Plates when laying the Steeldeck. At one end the I-Sections of the I-Plates are flush with the top surface, at the other end the I-Sections are cut back about ¾ in. so that when laid, the end joints are lapped tight.

I-Plates are applied directly over the members of the roof supporting structure and are fastened by sleeve "purlin clips" that telescope over alternate I-Sections. They have prongs that are bent around the supporting members (usually purlins), and hold the I-Plates securely.

Advantages of I-Plates Construction

(1) *Light in weight*—not over 5 lbs. per square foot including insulation and waterproofing.

(2) *Incombustible*—fabricated complete from copper-alloy steel.

(3) *Expansion and contraction difficulties eliminated.* Expansion joints are provided in two directions at the sides and ends of each I-Plate. There can be no accumulation of appreciable movement.

Insulation and waterproofing is positively free from injury by this usual source of trouble.

(4) *Any degree of proper insulation* may be easily obtained.

(5) *Saves time* in completion of buildings, especially in wet and winter seasons.

(6) *Low final cost*—light weight effects savings in structural supports.

(7) *Engineeringly correct*—spans to 8 ft. between supports, depending upon the loading requirements.

(8) *Permanent*—made of copper-bearing steel. Protected from above and below.

(9) *Adaptability*—best for straightaway, flat, pitched and curved roofs with a minimum radius of 40 ft.

(10) *Undivided responsibility.* Roofers will furnish roofs complete—deck, insulation and waterproofing.

Descriptive Data

Standard width of I-Plates: 2 ft.

Length of I-Plates: standard, 10 and 8 ft.; special as required, 10 ft. maximum.

Dimensions of I-Sections: spaced, 6-in. centers; depth, 1 in.; bottom flange width, ⅝ in.

The dead load of I-Plates Steeldeck Roof and insulation and waterproofing is approximately 5 lb. per sq. ft.

Truscon I-Plate Roof Construction

Laying Steeldeck Roof with Truscon I-Plates

PAN METAL ROOF DECK CO.

AKRON, OHIO

Product

Pan Metal Roof Deck.

Description

The Pan Metal Roof Deck is an improved metal form designed especially for roof construction, which has earned the approval of architects, engineers and builders everywhere.

It consists of pressed metal units as illustrated in the sectional details herein shown, and has no sharp folded members to take on rust. Consulting engineers agree with us, when we claim that no stronger sheet of light metal can be formed that will carry an equal load.

It provides long life, strength and perfect fitting joints. The sheets are formed under a powerful press, insuring uniform pans that will rest neatly, and they are made to lay 24-in. centers up to 12 ft. 2 in. long.

Insulation made in 12, 24, 36 or 48-in. widths will center on the wood cleats in pans. All sheets are laid from above and no underneath scaffold is required.

Galvanized sheets cost slightly more than painted (black) steel sheets but are more enduring. Sheets can be painted with acidproof asphalt paint for foundries and factories where gas accumulates.

Layout plans will be furnished by us from blue prints, insuring proper spacing.

Factory Sawtooth Construction

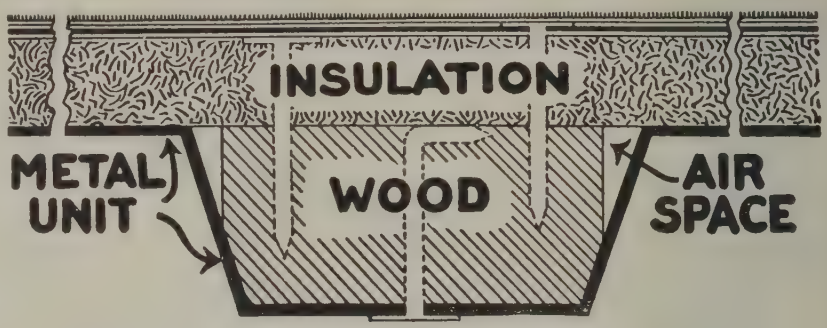
For factory sawtooth construction, the heavy steel frame can be eliminated and light metal joists with the pan deck substituted at greatly reduced cost.

Sheet Metal Building

There are tens of thousands of sheet iron buildings in use in the United States that are not insulated, because of the difficulty of connecting the insulation to the sheets. Without this insulation they are cold in winter and extremely hot in summer.

With the Pan Metal Deck and its method of wood cleat anchorage, any form of insulation can be nailed securely to the metal sheets. The sleepers provide air circulation through the slots at every purlin. These are made of wood that will not split, thoroughly painted with linseed oil paint and they will stay in position.

The seams or joints in this construction are made directly over purlins, thereby making a neat appearance when a finish underneath is desired.



Construction Details Showing Shape of the Pan Deck and the Location of Wood Cleat, etc.

Advise us of your requirements or your problems, and we will immediately give you all necessary information to enable you to erect a substantial structure at the least expense and trouble. Blue prints, etc., gladly supplied for all requirements.

For Residences

The Pan Metal Deck can be used on residences for pitched roofs when slate, tile or other roofing material is desired, rendering this construction fireproof inside and out.

The rafters are first placed in position and securely nailed. Upon them the purlins are laid and fastened; over these are secured the Pan Metal Deck forms. These in turn are covered with insulation, and with roofing material—shingles, tile, or whatever architect specifies. If built-up roofing is used, it is applied directly to insulating surface. Where asphalt shingles or strip shingles are used, they may be nailed directly to insulation.

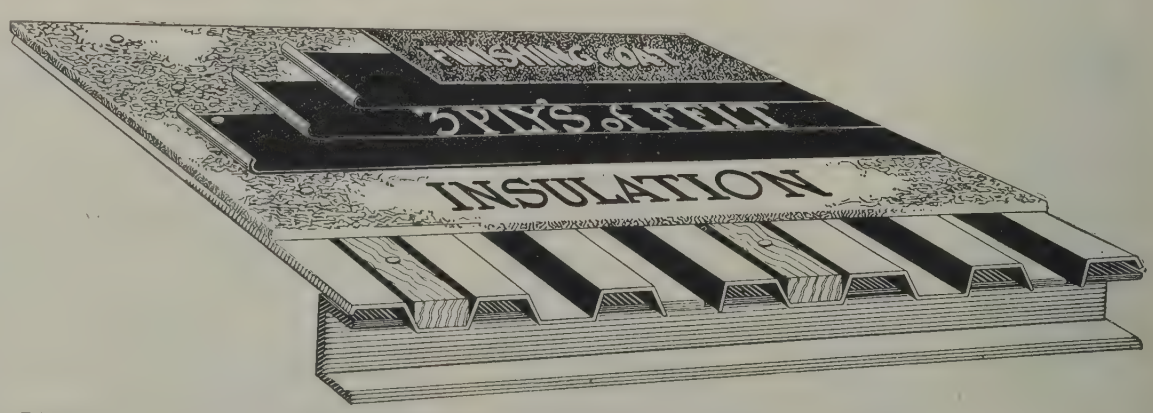


Diagram of Pan Metal Roof Deck Showing Light Metal Joist, Wood Cleats and Method of Laying Insulation and Roofing

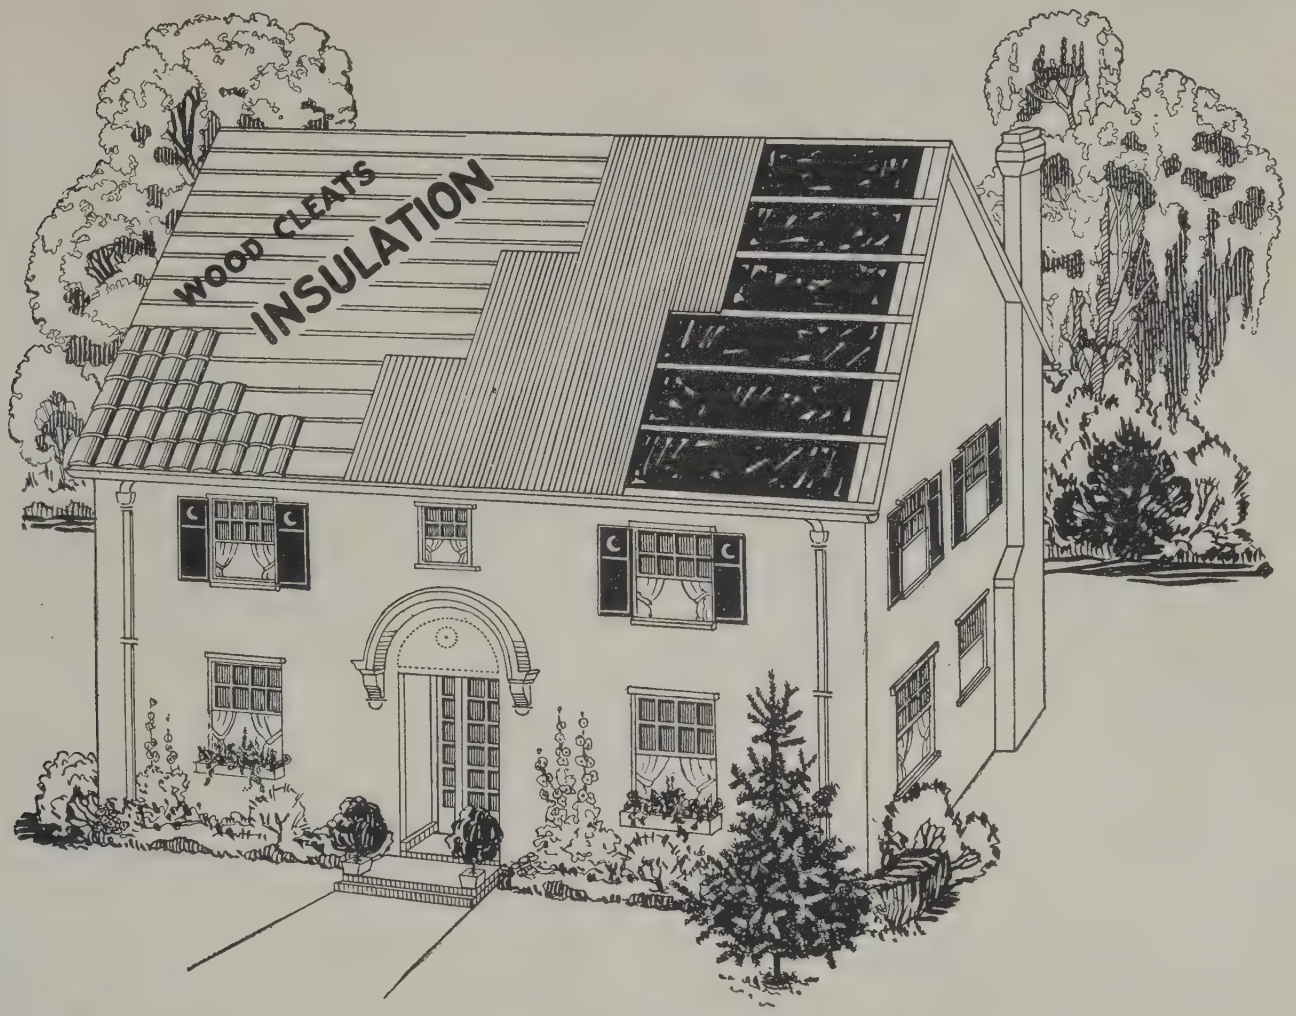
Fireproof above and below and insulated. None but galvanized sheets used in our construction.
The advantages of galvanized metal is obvious to every architect and engineer.
Metal decks have found their place in building construction

Continued on next page



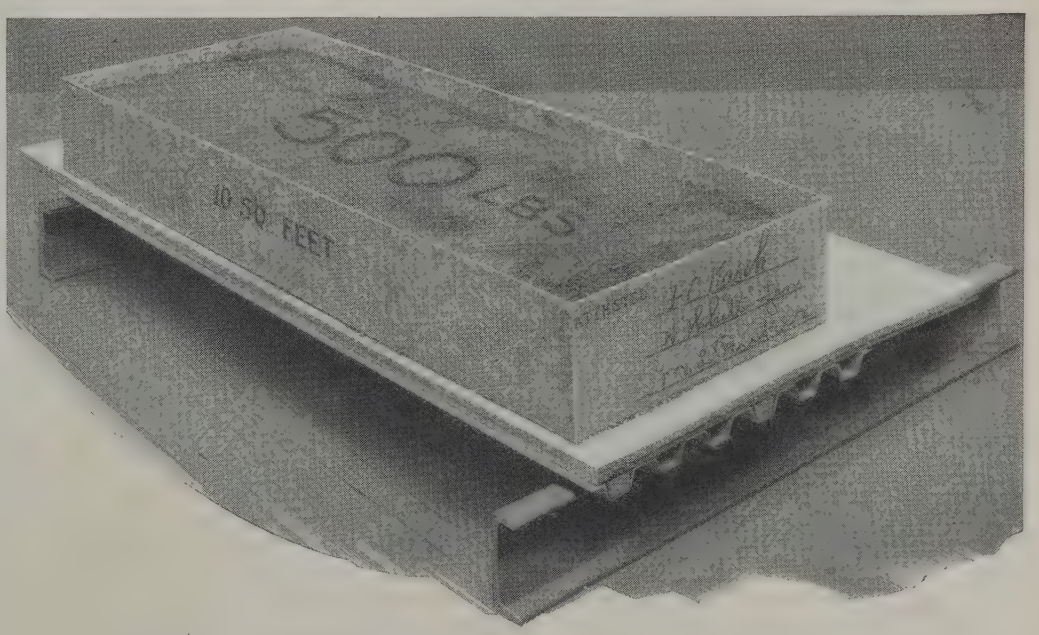
Pan Deck Used on Pitched Roof with Tile or Slate Covering

This combination with steel joists in either brick or wood constructed buildings will protect the building from adjoining hazards and will also keep the fire within the building. We know of no scheme that will assure such efficient fire protection at such low cost

The slot at the purlins is locked in ¼ in. wide by ¾ in. long. The lug is made of ⅛ in. thick hot galvanized iron and will not rust. It is so tough that it can be doubled and hammered together without breaking. The slot being ⅛ in. wider than the lug permits the metal to expand and contract.

Flashing at vertical walls can be securely nailed by placing an extra wood sleeper there.

If necessary to install gutters, a horizontal wood strip ⅞x20 in. can be nailed to ends of sleepers at the eaves.



An Actual Strength Test of Pan Deck Roof, 22 Gauge

Service and Information

We have placed the sale and erection of Pan Metal Roof Deck in the hands of only reliable roofers and sheet metal concerns in your territory who will give you first class service.

The erection of the METROPOLITAN SYSTEM of GYPSUM FIREPROOF FLOOR and ROOF CONSTRUCTION.

Metropolitan System of Gypsum Fireproof Floor and Roof Construction

The principle of this system is that of the suspension bridge. It is a gypsum slab poured in place on parallel and uniformly spaced cables, the ends of the cables securely and rigidly anchored to the frame of the building. Enough cables are put in to carry the total load, with a factor of safety of 4, without regard to the compression value of the Metropolitan composition.

The composition is 87½% calcined gypsum, and 12½% wood planer chips.

The practical advantages of the system have been demonstrated over a period of thirty-five years in hundreds of installations throughout the United States and Canada, under a wide extreme of climatic conditions.

Meritorious Features of the Metropolitan System

Safety and Strength—The metal construction makes the Metropolitan system one of the safest types of roof and floor construction. Stresses are calculated by approved engineering formulae. The cables carry all the load. The Metropolitan composition is used merely to protect the wires and structural framework against fire and corrosion and to distribute the load.

Economy of First Cost Due to Light Weight and Rapidity of Construction—Metropolitan composition weighs less than 5 lb. per sq. ft. per inch of thickness. For floors minimum thickness is 3½ in.; for roofs, 3 in. The light weight permits lighter beams and wide spacing, thus saving tons of steel. This feature makes it particularly advantageous in additional story work. In existing structures, this extreme lightness permits the replacing of less sturdy floors without either strengthening existing frames or overloading them.

The fact that Metropolitan gypsum composition sets within 30 minutes after the slab is poured, and forms can be dropped within 60 minutes, leaving slab good for calculated loads, makes for rapid construction—a prime factor in construction economy. The Swarthmore Apartments in Philadelphia, Pa., stand as a monument to the speed with which the system may be installed. This job was put up, 12 floors and roof, in fourteen working days.

Non-conductivity, Insulation and Fire Resistance—The high insulating value of Metropolitan gypsum composition as a roof material effects a saving in cost of the heating plant. Condensation of moisture on the undersurface is eliminated.

It is a fire resistant of the highest quality. Complete reports of fire tests conducted for the New York and Toronto building bureaus gladly furnished.

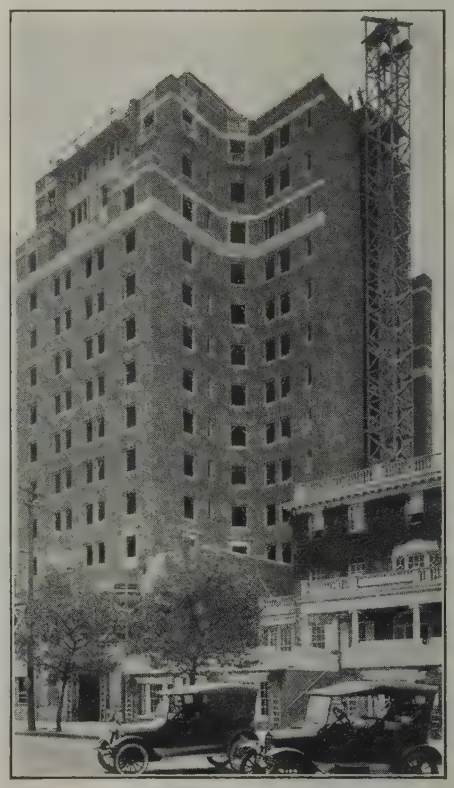
Sound Deadener—Gypsum has excellent sound deadening properties. In the Metropolitan composition full advantage is taken of this characteristic.

Durability—Metropolitan floors and roofs have been in active service, under severe conditions, for nearly forty years and are today, without exception, in as good a condition as when installed. Frequently sections have been cut out of Metropolitan floors which have been installed for many years, and in every case, the embedded beams and girders, as well as the steel cables, have been found in perfect condition.

Low Maintenance—Elasticity is necessary to good roof and floor construction. Shocks, vibrations and unequal stresses are likely to crack an inelastic construction. The wood filler in the Metropolitan composition provides elasticity and Metropolitan roofs and floors remain intact under the severest conditions, thus eliminating the annoyance and expense of constant repairs.

Service—This company contracts for entire installation of both floor and roof arches. They regard each contract as a sale of service in addition to sale of material and workmanship. Nor is delivery of service completed with acceptance of contract. It is a service, in other words, rendered not only *during* the work but *before* and *after* its execution.

Guaranteed Construction—The KEYSTONE GYPSUM FIREPROOFING CORPORATION guarantees every square foot of floor or roof construction they install against failure from any cause, under the conditions for which it was designed.



Colton Manor Hotel, Atlantic City, N. J.
Twelve Metropolitan floors and roof

Where the Metropolitan System Is Used

The Metropolitan system is in thoroughly satisfactory use in innumerable hotels, clubs, schools, hospitals, churches, apartment houses, theatres, office buildings, power plants, paper mills, machine shops, garages and manufacturing buildings.

Information for Designing

Services of Engineering Department—Our Engineering Department should be consulted before steel design of building is completed. We will gladly send our engineers to confer with you without expense or obligation.

Economical Spans—The construction can be installed between supports spaced up to 9 ft. in clear. Our experience has shown that under average conditions a spacing of 6 ft. 6 in. to 7 ft. is the most economical.

Waterproof Roofing—Any standard type of waterproof roofing may be successfully applied to our metropolitan system. The form most generally applied, however, is a 3-ply built-up roofing.

Specifications

Fireproof Floors and Roofs—After forms or centers have been placed in proper position, cables, each composed of two No. 12 (or equivalent) galvanized wires twisted, shall be carried over the tops of the beams or purlins to outside wall beams or end purlins and be secured to them by strong hooks or anchors. These cables shall be laid parallel, 1 to 3 in. apart, according to spans and loads, and shall pass under round iron bars, midway between the purlins, so as to cause the cables to deflect uniformly. The Metropolitan composition shall then be poured-in-place, and brought to an even surface about ½ in. above the top of the beams, forming a slab ready to receive [sleeper fill or grading] [finished roofing or grading] and with the underside left as smooth as practicable. The slab shall be designed to carry safely the live load with a factor of safety of 4.

Note: For fireproof floors, fireproofing beams and girders (not trusses) shall be used, according to the local building laws.

Cables composed of 2-No.12 Cold Drawn Galvanized Steel Wires Twisted

MONOLITHIC GYPSUM FLOOR and ROOF CONSTRUCTION:

Standard Suspension Type.

Hoge Rail Type (U. S. Pat.—1464711, Can. Pat. —241477).

Enclosed Rail Type (U. S. Pat. Pending, Can. Pat. —254632).

Preformed Rail Type Floor and Roof Slabs (Patent Pending).

Construction Service

This company, backed by 13 years' experience in gypsum construction, is at your service for advice and estimates for the above types of construction installed complete in any part of North America.

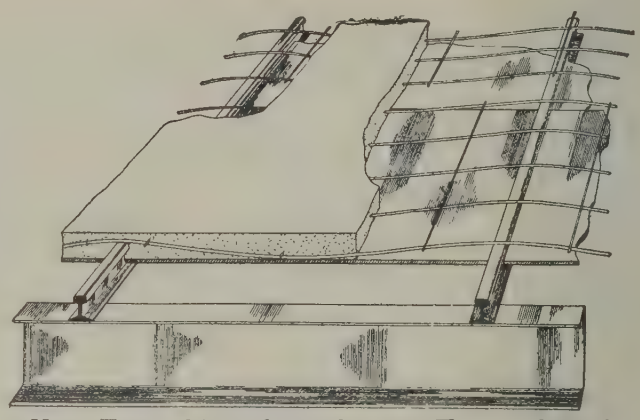
Rail Type of Monolithic Gypsum Floor and Roof Construction

The Standard Suspension type of gypsum slab construction was the only type of poured-in-place or monolithic roof and floor slab construction extensively used until the rail types were originated and developed by this company a few years ago.

Specifications and list of representative installations of the Standard Suspension type of construction sent on request.

While this company is prepared to install the Suspension type where specified or on rare occasions where it fits special conditions, the approval of architects, engineers, and owners throughout the United States and Canada is convincing proof that the Hoge and the Enclosed Rail Types are best suited to the great majority of conditions, and conform more readily to the standards of design and appearance required by architects.

Hoge Rail Type—In the Hoge Type small A.S.C.E. rail sections are laid about 32 in. apart on the top of walls, beams or purlins spanning the distance between beam or wall supports). On the lower flanges of the rails are supported ⅜ in. standard gypsum board, Celotex or Insulite composition board, with joints over purlins to form a solid under surface, paneled by the lower flanges of the rails. The rails are designed to carry all loads, which are transferred to them by continuous mesh reinforcement running across and resting on top of the rails. Standard gypsum composition is poured in place over the gypsum board, Celotex or Insulite, and finished smooth ½-in. or more above the tops of the rails, ready to receive the roof or floor finish. The under surface can be decorated as desired or a finished plaster ceiling can be applied.



Hoge Type of Monolithic Gypsum Floor and Roof Construction

Specifications Hoge Type Monolithic Gypsum Construction—The floors and roofs named herein shall be the HOGE Type Monolithic Gypsum Board and Rail Construction as furnished by the LATHROP-HOGE GYPSUM CONSTRUCTION Co., Cincinnati, Ohio.

A.S.C.E. rail sections designed to carry all loads between supports shall be laid on the top of walls, beams, or roof purlins at sufficient spacing to receive ⅜-in. standard gypsum board carried on the lower flanges; gypsum board shall be butted tightly to form an even undersurface and braced in place if necessary to prevent buckling; galvanized mesh reinforcement of a minimum area per foot of the slab cross section of .026 in. shall be stretched over the tops of rails and allowed to sag to the top of gypsum board, forming a continuous reinforcement.

Typical Sawtooth Construction

Continued on next page

Standard gypsum composition containing at least 85% calcined gypsum shall be mixed with water to a medium quaking consistency and poured into place, forming a solid reinforced slab 2½ in. thick, including the gypsum board. The top surface of slab shall be left ready to receive the finish desired, such as fill, grading or waterproofing.

Overhangs in direction of span of rails shall be formed by extending same to required distance beyond the last purlin. Other overhangs shall be reinforced on the cantilever principle with reinforcement embedded in the adjacent main slab and secured to the steel of the same.

Curbs, walls, mullions, etc., shall be constructed with gypsum board facing and gypsum composition poured or plastered to regular thickness on the outer surface; or such curbs, walls, mullions, etc., may be constructed of precast gypsum blocks, all joints to be struck and outer surfaces on roofs left ready for waterproofing or other finish.

Typical Installations Hoge Type—

John Van Realty Co., Cincinnati, Ohio, 130,000 sq. ft.
Clinchfield Railroad Co., Erwin, Tenn., 93,000 sq. ft.
Pullman Car Co., Pullman, Ill., 300,000 sq. ft.
University of Illinois, Urbana, Ill., 85,000 sq. ft.
Bessemer Gas Engine Co., Grove City, Pa., 44,000 sq. ft.
Fraser Co., Ltd., Madawaska, Me., 240,000 sq. ft.
White Motor Co., San Francisco, Calif., 35,000 sq. ft.

Installations of the Hoge type may be found in practically every section of the United States.

Enclosed Rail Type—Where fireproofing or greater insulation value is desired, wooden forms are hung so as to cover the bottom of the rails with ¾ in. of gypsum composition, leaving a solid, even paneled gypsum under surface as in our Standard Suspension type slab.

Typical Installations Enclosed Rail Type—

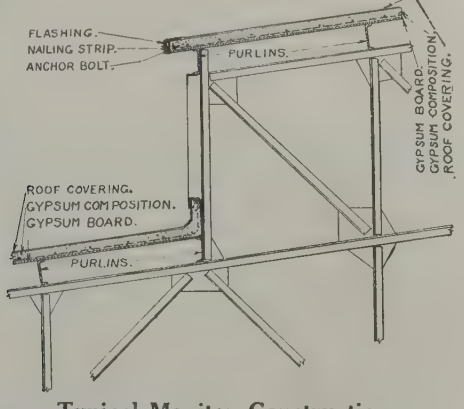
Port Alfred Pulp & Paper Co., Port Alfred, Que., 135,000 sq. ft.
Newfoundland Power & Paper Co., Corner Brook, N. F., 43,000 sq. ft.
Southern International Paper Co., Bastrop, La., 98,000 sq. ft.
Southern International Paper Co., Camden, Ark., 85,000 sq. ft.
United Paperboard Co., Lockport, N. Y., 46,000 sq. ft.
E. B. Eddy Co., Hull, Que., 35,000 sq. ft.

Specifications, Enclosed Rail Type Monolithic Gypsum Slab Construction—The floors and roofs named herein shall be the Enclosed Rail Monolithic Gypsum Slab Construction as furnished by the Lathrop-Hoge Gypsum Construction Co., Cincinnati, Ohio.

Standard rail sections designed to carry all loads between supports shall be set on walls, beams, or roof purlins at proper elevation to provide at least ¾-in. covering of gypsum under their bottom flange. Across these rails shall be stretched galvanized mesh reinforcement, having .026 in. minimum area per foot of slab cross section, and allowed to sag to within ¾-in. of temporary wood or other forms, making a continuous reinforcement at right angles to the rail subpurlins.

Standard gypsum composition containing at least 85% calcined gypsum shall be mixed with water to a medium quaking consistency, and poured into place on the forms, completely enclosing the rails to form a slab 3 in. thick (or more where specified). The top surface of slab shall be left ready to receive the finish desired, such as fill, grading, or waterproofing.

Overhangs in direction of span of rails shall be formed by extending same to required distance beyond the last purlin. Other overhangs shall be reinforced on the cantilever principle, with reinforcement embedded in the adjacent main slab and secured to the steel of the same.



Typical Monitor Construction

Curbs, walls, mullions, etc., shall be constructed with gypsum composition as above, sufficient steel reinforcement being provided to stiffen against wind pressure or other loading. Or such curbs, walls, mullions, etc., may be constructed of gypsum composition blocks laid up in gypsum mortar, all joints to be struck, and outer surfaces on roofs left ready for waterproofing.

Typical Details of Eave Purlin

Advantages of Rail Types

The rail types of construction have all the advantages of light weight, time saving construction, high insulation properties, fire resistance, vibration resistance, permanence and strength of the standard suspension type and eliminate the special steel designs required for that type.

It is readily applied to framing designs not laid out for the standard slab, in replacement of old roofs and floors where applications to framing are difficult, or where a uniform paneled under surface is desired.

The simplicity of the above designs permits adaptation to any layout of supports by varying the size of rails. No steel supports are required at the walls.

Suspended System

Marks Poured-in-Place Gypsum Roofs

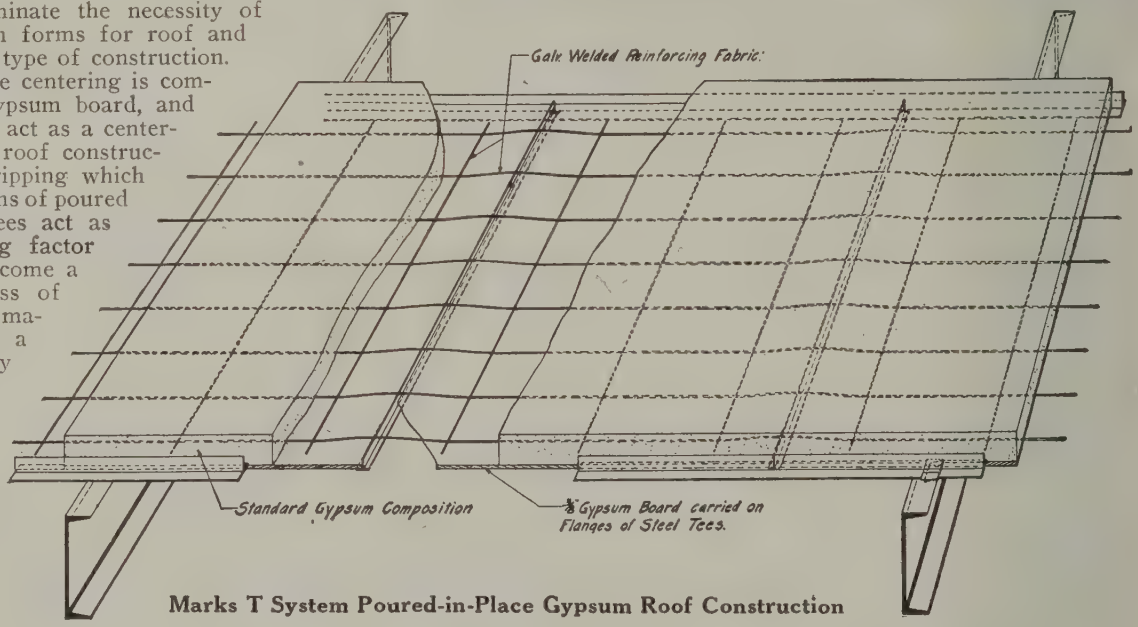
The Marks T System of Poured-in-Place Gypsum Roofs was designed primarily to eliminate the necessity of erecting temporary wooden forms for roof and floor slabs required in this type of construction. In the Marks T System the centering is composed of steel tees and gypsum board, and not only does this material act as a centering, but it remains in the roof construction and eliminates the dripping which is unavoidable in other forms of poured construction. The steel tees act as an additional load bearing factor and the gypsum boards become a part of the total thickness of the roof slab; so that this material, though acting as a form temporarily, actually becomes a part of the roof structure.

The galvanized welded wire reinforcement, in which the longitudinal members are spaced 4 in. apart and cross members 12 in. apart, is made in rolls of the same width as the space between the longitudinal tees, and is continuous from one side of the roof to the other.

Advantages of This Construction—There are many:

Very frequently a considerable sum of money can be saved on account of its light dead load, especially if the Marks engineers are consulted before the steel columns, trusses, etc., have been designed.

The centering is practically tight and the aggregate poured does not drip through the slab, thereby keeping the interior of the building clean. There is, therefore, no inconvenience to any



Marks T System Poured-in-Place Gypsum Roof Construction

Marks T System Roof in Process of Construction

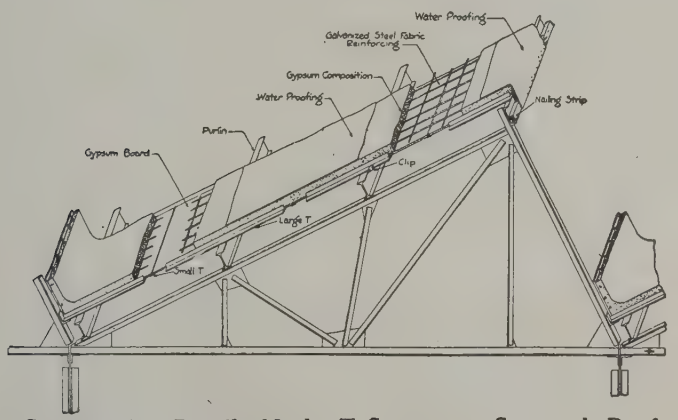
THE BALLINGER CO., Engineers WARK CO., General Contractors

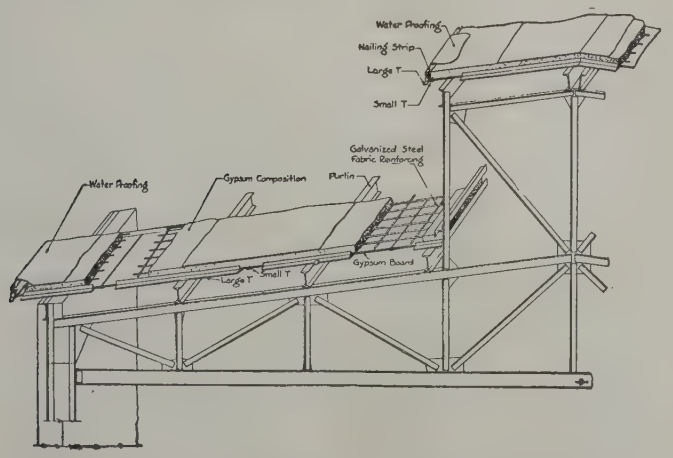
other work going on in the interior of the building. Especially is this a very important factor in re-roofing old buildings where continuous operation is required.

In the Marks T System the underside is perfectly clean. All of the companies for whom the Marks T System Roof has been built are very much pleased with the underside finish. It is not only a roof, but a finished ceiling.

The gypsum board finish absolutely prevents all dusting and discoloration of the gypsum on the underside.



Construction Details Marks T System on Sawtooth Roof



Construction Details Marks T System on Monitor Roof

In the Marks T System the steel reinforcement, the important factor in the load bearing capacity of the roof, has a minimum protection of ⅜-in. thickness of gypsum board. No end bay bracing or tie rods are required with the Marks T System.

The combination of structural tees and reinforced gypsum on the Marks T System eliminates the possibility of sag between purlins. This construction is entirely above the purlins, and is adapted to meet any standard design of framework without changes or additions. Everything is furnished, including tees, materials and labor, completing the work ready for waterproofing.

Specifications for Marks T System Poured-in-Place Gypsum Roof

The roof decks shall be constructed of ..... thickness of the Marks T System of Reinforced Gypsum in accordance with the details of construction as shown in the Marks catalogue. This work to be installed by the H. E. MARKS CORPORATION, Pittsburgh, Pa.

Gypsum Floor and Roof Construction

225 South Fifteenth Street
PHILADELPHIA, PA.

Products

SUSPENSION SYSTEM, POURED-IN-PLACE GYPSUM FLOORS and ROOFS.

Description of the Suspension System

The suspension system and the formulæ used are based upon the simple principles of the suspension bridge. Cold drawn, twisted steel cables are laced across the floor or roof and are securely anchored at both ends to the wall purlins or beams. The cable spacing is such that the cables bear the entire designed load with a factor of safety of four. Steel transverse rods deflect the cables in the center of each arch and give them initial tension.

Advantages

Strength—Since the steel cables alone are considered, the gypsum being ignored, in calculating the strength of the slab, different commercial loads are taken care of by varying the cable spacing.

Light Weight—The suspension system gypsum slab weighs but 4½ lb. per sq. ft. per in. of thickness. Average floor slabs are 4 in. thick; average roofs slabs are 3 to 3½ in. This weight combined with beam spacings averaging 6 to 7 ft. produces remarkable savings in the amount of steel used in the building framework.

Speed of Construction—The wooden forms used in pouring the slab may be stripped one hour after pouring and the slab will be capable of bearing the full designed strength. Practical construction men can appreciate what this means in the way of rapidity of construction.

Fire Resistance—Numerous official tests have demonstrated that a gypsum slab will resist intense fires for long periods and not only effectually prevent the spreading of the fire, but also suffer but small damage to itself, which is easily repaired.

Heat Insulation—As a heat insulator, gypsum is more than three times as effective as stone or cinder concrete. No other fireproof material is nearly as effective as a heat insulator. This means saving in heating plant investment and in fuel bills. It also means freedom from condensation drip from the underside of roof slabs.

Durability—Suspension type gypsum roofs installed over thirty years ago are in a condition equal to that of the day they were installed.

Other Advantages—In addition, gypsum suspension slabs are elastic and free from expansion or contraction strains. Gypsum slabs lend themselves readily to alterations, such as cutting holes for stairways. Gypsum is also a sound-deadening material.

Specification

The floor [roof] construction shall be Poured-in-place, Suspension System, Gypsum Slab. No. 12, cold drawn, twisted steel cables shall be laid over the tops of the beams [purlins] and secured to the wall beams [end purlins] by means of strong strap anchors and anchorage rods. These cables shall be laid parallel .... inches apart (see table) and shall be tied down in the center of each arch by means of iron rods running parallel to the structural beams. The wooden forms shall be placed so that they are ½ in. below the undersurface of the deflected cables. Gypsum concrete, composed of calcined gypsum and not more than 12% by weight of soft wood chips, shall be poured-in-place and be troweled to an even surface ½ in. above the tops of the beams [purlins], ready to receive the sleeper fill [grading] [waterproofing] [slate] [tile]. The slab shall carry the specified live load of .... pounds per square foot with a factor of safety of 4.

LEXINGTON 1183, 1184, 1185

Graybar Building, 420 Lexington Avenue
NEW YORK, N. Y.

CABLE ADDRESS
"AMEREBRICK"

AGENTS IN ALL PRINCIPAL CITIES OF THE UNITED STATES AND CANADA

TRADE AM-EN MARK

The Last Word in Enameled Brick

Products

ENAMELED and PORCELAIN BRICK: White, Mottled and Standard Colors in Standard Sizes and Ornamental Shapes. (See plates.) We are the largest manufacturers of this commodity in North and South America.

Territory

The business operations of this firm cover North and South America, Europe, Asia and Australia.

Personal Representatives

For the convenience of our customers in the United States and Canada, we have, in order to keep in closer touch with them, located representatives in all the principal cities to attend personally to inquiries, orders and deliveries.

Dispatch of Shipments

Factory and office are in constant telephone connection with each other, and we have a local telephone exchange connecting every department of the factory for quick and systematic dispatch of business.

Shipping Facilities

Our works, located but an hour's travel from the New York Office, are situated so as to enable shipping over two of the largest railroads—the Pennsylvania and the Central of New Jersey, and their connecting lines. We are also situated on tide water, so that shipments can be made by vessel for the coastwise and export trade.

Precaution Against Delay

Every part of our factory, including machinery, has its duplicate, which prevents any possibility of delay caused by breakdowns, should they occur.

Capacity

Our present capacity is 12,000,000 brick per annum, which will be increased as occasioned by the demand.

Stock

The average stock on hand at our factory is more than 2,000,000 brick, giving a large assortment for immediate shipment.

Illustrations of Stock Designs

Much delay is saved by use of stock design of moulded brick. In the two following pages are shown designs that we recommend as being most satisfactory in manufacturing results. We try to keep a stock of these on hand, in standard colors. These designs are chosen to reduce manufacturing difficulties and delays to a minimum; to enable composite mouldings to be made up; and to enable prompt filling of orders.

Send for plates and actual paper reproduction depicting decorative possibilities of enameled brick.

Details Required for Special Arch Brickwork

When ordering special arches, please consult the accompanying cuts and give all necessary information as to details. Furnish details as far as possible in advance of the time the arches will be required. We should be allowed from 4 to 6 weeks' time to make up arch brick to conform with detail. We keep no arches in stock.

We can not always guarantee uniformity of shade in arches as in regular deliveries of first quality plain stock brick, therefore strongly recommend the use of stock specials for lintels of doors and windows. (See study of window opening on second page following.)

Colors—In Bright Enameled or Dull Porcelain Finish

In addition to our regular white and standard colors, such as our sage green, red brown, black, etc., we have made a specialty of mottles in the following colors:

Gray, brown, black, mixed gray and black, which give an excellent appearance for both interior and exterior work, having a finish more on the type of marble than enameled brick.

If you have in mind, at any time, a particular color, shade or finish of enameled brick for interior or exterior purposes, advise us of your ideas and requirements and we will be pleased to submit samples.

Uniformity of Shade of Our Product

We guarantee uniformity of shade in all first quality deliveries to the limit of practicability. Colors and effects giving most uniform results are, in order of uniformity, white, mottled gray, mottled brown, mottled black, sage green and red brown. Other colors follow in irregular positions.

We will try on orders of moderate size, or on larger orders if ample time be given, to match in shade the moulded and stretcher stock, but can not always guarantee to uniformly shade shipments of specials, particularly on rush shipments.

Special Features and Advantages

In making our product we follow the English and Scotch systems, working by the soft mud process. This is without question the only process which insures durability and the closest relation of bond obtainable between body and glaze.

Our brick are burnt in but one fire, thus making the chemical change in the body and the glaze simultaneous.

Where manufacturers use the dry pressed process, the brick have to be burnt first as front brick before the enamel can be applied, and fired again for the fluxing of the glaze.

We use hard and durable glazes, not soft lead glazes frequently seen on inferior grades of enameled brick and tile.

There has not been a single case during our 36 years of business where any peeling or discoloring has been seen or reported.

This is better than any guarantee which we might be asked to give, as it covers a distributed output of over 145,000,000 brick, located all over the United States and elsewhere and subject to all varieties of climatic conditions.

Cleaning

Enameled brick are best cleaned with some alkaline solution, such as caustic soda or sodium carbonate. This cleans the enamel and does not affect the cement or lime mortar.

Acids

Sulphuric, nitric, or hydrochloric acids, even in concentrated form, will not affect our glazes; but if used as a wash, even when diluted, they will attack the cement or lime mortar.

The only commercial acids which will attack and destroy our enamel are hydrofluoric and hydrofluorsilicic.

General Information

BRICK *forever*

Herewith are presented the essential data and information about common brick which the architect or engineer should have at his command.

Common brick includes all types of burned clay or shale brick which have a natural surface, i.e., not specially treated to produce certain surface effects. As is well known, common brick can be had in a wide variety of colors and surface textures, even in brick made in the same locality. The overburned "clinker" brick and the "culls," with both of which architects have accomplished such beautiful effects, are common brick.

Strength of Brick Walls

Recent investigations at the U. S. Bureau of Standards (1926-1927) furnish the latest, most complete and authoritative data on brick wall strengths. The essential results obtained in tests on over 160 full-sized wall panels, 6 ft. long by 9 ft. high and of several thicknesses, are tabulated below. The ultimate compressive strengths of both solid and Ideal (Construction described in "Brick—How to Build and Estimate") hollow walls, per square inch of gross cross-sectional area are given.

Fire Resistance of Brick Masonry

The recommendations of the National Board of Fire Underwriters, through the Underwriters' Laboratory, Inc., are as follows:

Walls (exterior and interior) and partitions built of common, hard-burned clay brick with cement or lime and cement mortar, conforming in height, loading, and other limitations to requirements of the building code, recommended by the National Board of Fire Underwriters; of good average workmanship and quality of materials, and built according to good current practice

Character of brick	Thickness of wall, in.	Type of wall	Kind of mortar: Cement	Lime	Sand	Compressive strength, lb. per sq. in. of gross cross-sectional area: Max.	Min.	Avge.	Workmanship
"A" Stiff mud, end cut C.S.-3280 M.R.-1225	8	Solid	1	.....	3	751	578	664	Poor

12	A.R.	1—1—6	742		

Average wall strength, all hollow walls, 1—1—6 mortar = 822.

Ratio, all types hollow walls, $\frac{\text{1—3 Mortar}}{\text{1—1—6 Mortar}} = 0.768$.

Continued on next page

are shown by tests conducted at the United States Bureau of Standards and at Underwriters' Laboratories, Inc., in accordance with the Standard Fire Test Specification to furnish protection against passage of flame and dangerous transmission of heat for the periods stated in the following classifications. The thickness here given as 12 in. is in some parts of the country designated as 13 in. These terms are to be considered as equivalent.

CLASSIFICATIONS

	Ratings
4-in. interior partitions. Non-bearing	1 hour
8-in. interior or exterior walls. Non-bearing, or bearing with incombustible structural members framed in	5 hours
Bearing, with combustible structural members framed in	2 hours
12-in. interior or exterior walls. Non-bearing or bearing. Not less than	9 hours

The foregoing classifications will usually be increased at least ½ hour by the application of portland cement stucco or portland cement or gypsum plaster ¾ in. thick, to either side.

The report of the Bureau of Standards' tests, too voluminous for inclusion here, is found in the Bureau of Standards Circular Letter No. 228. It contains much more data than given in the rating table above.

Thermal Resistance

The subject of resistance of brick masonry to the transmission of heat and to the infiltration of air has been a matter of investigation by several authorities and is, at the present time, being studied. Our present knowledge is perhaps best reflected in the following data taken from the 1928 edition of the American Society of Heating and Ventilating Engineers "Guide." It should be remembered that the values given reflect the condition of a 15-mile wind blowing against the exposed side of the building; values for still air would necessarily be somewhat lower than that given.

VALUE OF COEFFICIENT "U"
(B.t.u. per square foot per hour per degree)

Brick walls, thickness in inches	8	12	18	24
Plain, no interior finish	0.358	0.278	0.218	0.173
½-in. plaster on one side	0.332	0.263	0.208	0.166
¾-in. plaster on metal lath, furred	0.216	0.185	0.156	0.131
½-in. plaster on wood lath, furred	0.209	0.179	0.152	0.128
½-in. plaster on ⅜-in. plaster board, furred	0.215	0.184	0.155	0.131

It is important to remember that the heat loss from buildings through windows, doors and through the roof is at a very much higher rate than could possibly take place through brick walls. Attention to these points brings much greater returns than efforts to increase the thermal resistance of brick masonry.

Sound Resistance

Quantitative data on sound resistance requires considerable explanation to make it understandable and useful. Such values as are commonly given are those supposed to represent relative intensities as measured by the ear and are the natural logarithms of the physical factors of reduction as determined by laboratory experiments.

Investigations at the Bureau of Standards show brick masonry to have a very high reduction factor even in thin walls. The following values will give a rough idea for the more common constructions:

AVERAGE REDUCTION FACTOR

8-in. brick wall plastered both sides	5.72
3¾-in. brick wall, plastered both sides	5.37
2¼-in. brick wall, plastered both sides	4.87
2¼-in. brick wall, furring, plaster boards and plastered both sides	5.35

Weather Resistance

The physical properties of brick itself has but little to do with the ability of brick masonry to resist water penetration. The real situation is best expressed in the following abstract taken from the 1928 annual report of Committee C-3 (the brick committee) to the American Society for Testing Materials.

"There appears to be a widespread belief that the percentage of absorption of individual bricks is a governing factor in the ability of brick masonry to resist moisture penetration. It has been conclusively shown that such a belief is erroneous. On the contrary, a certain amount of absorption in the brick assists in obtaining a better bond between brick and mortar and therefore a more water-tight joint. Any water penetration in brick masonry undoubtedly passes largely through the mortar joint and not through the brick. This committee has always felt that if absorption percentage has any significance, it is as a possible measure of that quality of brick masonry known as durability."

Permanence

The very process of making brick produces an inherent quality of permanence. The clays and shales, which are the raw materials from which brick are made, have been purified and reduced by nature to a chemically stable compound or mixture, and the process of burning for many hours at high temperatures (about 2000° F.) produces a product which is as near indestructible as any building material can be. No building material surpasses brick in this respect.

There are no laboratory tests which can accurately measure the permanence of a building material, time alone can supply the test. Brick structures of all kinds standing in almost perfect condition after centuries of exposure are the best proof of the permanence of common brick.

Publications

Books of the Association, which the architect should find useful, are listed below:

The Heart of the Home—Beautifully illustrated brick fireplace designs with complete directions for proper construction. 25 cents.

Skintled Brickwork—Photos and details showing how to obtain these interesting and attractive wall surfaces. 15 cents.

Brick—How to Build and Estimate—A complete manual of brick construction including important and useful data and tables of required material quantities. 25 cents.

Mortar—All the essential information about mixing and using all kinds of mortar. Free.

Reinforced Brick Storage Structures and Silos—Full information and data on these economical brick structures including complete construction directions. 15 cents.

Strength and Other Physical Properties of Brick Masonry—Free.

THE CARLYLE-LABOLD CO.

Manufacturers of Clatone Face Brick

PORTSMOUTH, OHIO

PLANTS: SCIOTOVILLE AND COAL GROVE, OHIO
(Both on Norfolk and Western Railway)

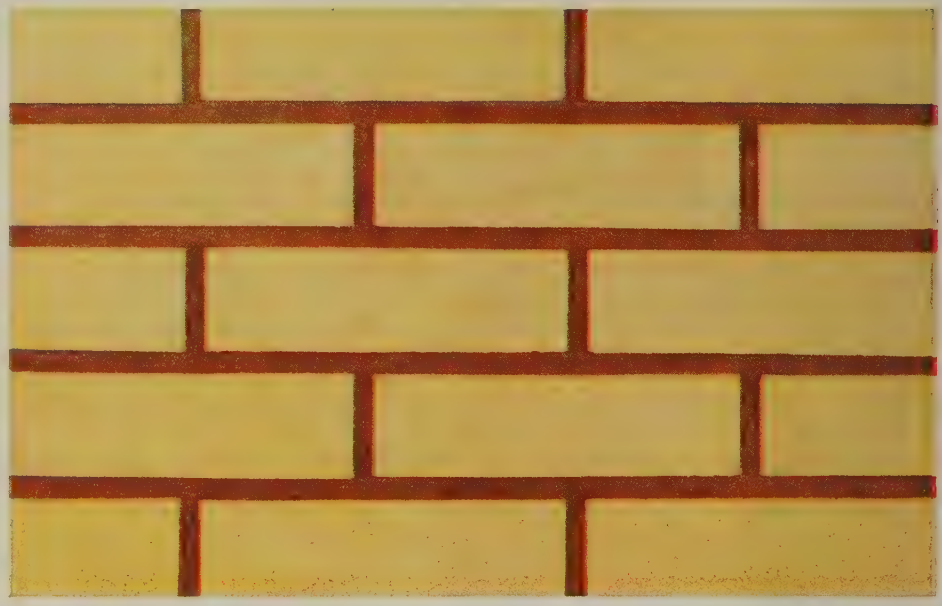
Clatone Face Brick

Clatone Face Brick are produced in Buffs, Greys, Tans and Ironspots in a special smooth and rough texture.

Clatone Face Brick are made of clays of high and uniform quality by an organization which is putting into its products today the full benefits of the experience and knowledge gained in 25 years of brick manufacture.

The wide range of colors and textures available in Clatone Brick enables the architect to achieve many beautiful color harmonies and unusual effects with Clatone Brick. They are mined from fire clay, entirely free of impurities that might result in discoloration of any kind.

See also our pages on Quarry Tiles.



Above: No. 75
A beautiful shade of Ivory Buff in the smooth texture. This is an excellent Brick for either interior or exterior work on almost any type of construction.

CLATONE

Left: No. 507
An attractive blend of Buffs, Pinkish Buffs and Light Greys. The combination of colors in this blend is very attractive and can be used to advantage by architects desirous of obtaining the unusual effect.

Below: No. 661
A beautiful blend of light and dark rough texture Ironspots. The different shades in this blend can be furnished separately in the same texture. We can also furnish the same shades selected or blended in the smooth texture Ironspots.

Production Facilities

Our annual capacity of twenty-five million bricks assures you of satisfactory shipments and avoids delays in building construction. Our plants are centrally located for quick shipments to any part of the United States and Canada east of the Rockies.

We distributed these bricks during 1928 into thirty-two states, Canada and Cuba. Authorized dealers in all principal cities. Inquiries sent direct to Portsmouth will be given immediate attention.

THE FINZER BROS. CLAY CO.

Manufacturers of Finzer Face Brick for Interior and Exterior Use

SUGARCREEK, OHIO

THE CLAY CITY

Finzer Bros. Face Brick Colors

The regular Finzer line of face brick can be supplied in the following colors:

Finzer Red Rug Face—110, 120, 125, 130, 140, 145, 150.

Finzer Red Smooth Face—10, 20, 25, 30, 40, 45, 50.

Finzer Ivories Rug Face—220, 230, 250.

Finzer Ivories Smooth Face—320, 330, Courts.

Finzer Golden Buffs Rug Face—280, 290, 290 Special, 295, 297.

Finzer Golden Buffs Smooth Face—380, 390, 390 Special, 355 Range.

Forestblend Matt Face.

Forestblend may be obtained in five shades of each of the colors listed below. Forestblends offered in Shades 410 to 460, inclusive, will permit the architect to effect practically any color scheme desired. That is accomplished by eliminating certain shades and substituting others. This additional service is given without extra charge by Finzer representatives.

455A—Browns and Blues.
455AX—Polychromes, Red, Brown and Gunmetal.
455B—Dark Tangerines.
455C—Greens in range.
455CX—Red, Purple, Green and Russet Polychrome.
455D—Reds and red hearts.
455E—Light Tangerines.
455F—Sycamore Barks.
455G—Golden Matts. Range of color.
410—Light Reds.
420—Medium Light Red.
440—Medium Dark Red.
445—Dark Red.
450, 460—Range Dark Red.

Here are some of the most popular ranges: (a) A C and 445 Blend; (b) Orientals—Browns, Blues, Reds and Tangerines; (c) 455 Full Range; (d) 456 Full Range with 20% Sycamore Barks; (e) B and E Tangerine Mix; (f) 455 AX and CX mix; (g) 455 F and G Mix.

Textures

Finzer Face Brick can be secured in Smooth, Forestblend or Rug Textures. Forestblends (in Shades 410 to 460) are made by special patented process and can be obtained only from the Finzer Bros. Clay Co. or their representatives.

Special Note

Regular carload mix of Forestblend consists of 35% 455A's, 20% B and E's, 20% 455C's and CX, 10% of 445, 15% 455D's. These percentages can be varied to suit the purchaser's requirements. We can also include a percentage of straight Red Matts in shades 410 to 460 if a definite red tone is desired.

Plant Locations and Shipping Facilities

The Finzer Bros. plant is located on the Wheeling & Lake Erie Railroad, which road is able to furnish ample cars for all requirements. We have connections with New York Central, Pennsylvania, Baltimore & Ohio, Erie and Nickle Plate roads and all leading trunk lines of Eastern United States. The yearly capacity of our plants is 52 million bricks. Orders of any size can be taken care of promptly.

Special Advantages

The plant is located in Sugarcreek, Ohio, where the clays are renowned for their purity and beauty. Ours is one of the few plants equipped to mix shale and fireclay thereby producing shades which can be manufactured in very few plants. Our Factories are located on the same siding, and are the most up-to-date and modern in the Middle West. No extra charge for handling or shipping mixed carloads. Finzer Bros. representatives are located throughout Eastern United States and prompt shipments of any amount of brick can be made on short notice.

Samples

Samples of the textures and colors of Finzer Face Brick will be sent free of charge upon request.

Specifications

To insure the use of Finzer Bros. brick, insert the word "Finzer" or "Forestblend" at any place where face brick is called for in the specifications.

AC & 445—33⅓% A 33⅓% C & CX 33⅓% 445
Laid up in Flemish Bond

FISKE & COMPANY, INC.

Manufacturers of Face Brick—Sole Manufacturers of "Tapestry" Brick

115 Federal Street
BOSTON, MASS.
BRANCH OFFICE: 17 West 46th Street, NEW YORK, N. Y.

Products

FACE BRICK: FISKE MILTON REDS, DARLINGTON GRAYS, "TAPESTRY," "TAPESTRY" ANTIQUES, "CALEDONIAN," and other high grade Face Brick.

Also Fire Brick and Brick Specialties.

Trade Names and Patents

"Tapestry" Reg. U. S. Pat. Off.
"Fiske" Reg. U. S. Pat. Off.
"Caledonian" Reg. U. S. Pat. Off.

To protect our customers against substitution of inferior products, these trade-marks are branded on our bricks.

"Darlington Gray"

A beautiful smooth surfaced brick, gray with large or small manganese specs as desired. Furnished in uniform shades of clear gray (tunnel kiln) or in a wider range with flashed brick (coal-burned). Fiske "Darlington Grays" with the distinctive gray background they offer are increasingly popular.

Fiske B. F. 5

This is another tunnel-kiln brick furnished in a clear shade of a delicate cream buff.

Fiske B. F. 43

The same brick as the B. F. 5 with a slight color range towards the clear gray.

"Fiske" Brick

A face brick with smooth face in grays and buffs, or end-cut rough texture in full range of colors and clear reds.

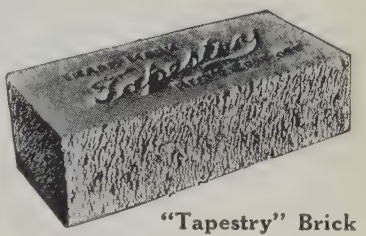
"Caledonian" Brick

A horizontal rough texture side-cut face brick burned to either clear colors or a range of shades.

"Tapestry"

This brick is too well known to the architectural profession to require detailed description. Its rough texture, end-cut face and flashed shades have become so popular that in many instances the name "Tapestry" has been applied to all brick approaching this description. Architects know that there is only one "Tapestry" Brick—that to get "Tapestry" Brick color effects "Tapestry" Brick must be used.

To protect both the architect who is building for distinction and the owner who takes pride in having the best, we mark each brick with the name "Tapestry."



"Tapestry" Brick

"Tapestry" Antiques

A variation of Fiske "Tapestry" Brick. These are, as the name applies, irregular bricks that might have come from an old English wall. Their shape and extra-flashed colors make "Tapestry" Antiques ideal for certain work.

Fiske Brick Colors

Fiske colors cannot be copied.

Individual deposits of raw material, expert, specialized firing, painstaking selection for shade and range make possible brick that no one else can duplicate. By the same token your order with Fiske can *always* be duplicated. An example of this is shown in the addition to the Union Trust Company of Providence, R. I., now being built (July, 1928) where the architect, George Frederick Hall, is matching Fiske Brick he used when he built the original structure 21 years ago.

Fiske Service (Since 1864)

Fiske service starts with the order and follows through till the final brick is laid. With large plants and unequalled facilities for filling every order on schedule FISKE & COMPANY, INC., offers the architect a welcome relief from delivery worries. You can count on Fiske Brick being on the job when, as and how you want them.

"The Black Brick Building," American Radiator Company, New York, N. Y.

Architectural Brick Development

FISKE & COMPANY, INC., has pioneered so many innovations in brickwork that it is natural for the architect to look to us for help in developing new brick. As was the case when Fiske co-operated with Raymond B. Hood in developing the now famous Fiske black brick for American Radiator building.

We can be of material assistance in working out new effects in brickwork. In view of the vogue of color which is sweeping the country such co-operation should be of unusual value to the architect who is seeking distinction in his brickwork.

PITTSBURGH, PA., Martin Brick Co.
ST. LOUIS, MO., McEwing & Thomas Clay Products Co.
WASHINGTON, D. C., O. W. Ketcham

and in all leading cities

Product

A complete line of Face Brick sold under the trade name "Greendale". Suitable for every type of construction from the simplest bungalow to the most elaborate office building or public structure.

"Greendale"
TRADE MARK
FACE BRICK

Characteristics

"Greendales" are made from clays of unusually high and uniform quality, mined on our own properties. "Greendales" are thoroughly burned, vitrified, and retain their original beauty. Age and weathering only serve to enhance their beauty. They can be obtained in an unlimited variety of color tones ranging through various shades of red, buff, brown and gray. "Greendale" brick are assorted in uniform shades and can be blended in any percentage. The popularity of "Greendale" Brick is widely recognized because of their distinctive texture and wonderful color harmony.

"Greendale" Rug Brick

The texture of the "Greendale" Rug when laid in a wall gives the appearance of the soft and alluring color tones of a Turkish or Persian rug.

Shades — No. 72 Light Ivory; No. 74 Cream; No. 76 Light Buff; No. 78 Medium Buff; No. 80 Dark Buff with pinkish cast; No. 86 Flashed Grayish Brown; No. 88 Light Brown, tan cast; No. 90 Medium Brown; No. 92 Dark Brown; No. 94 Gun Metal.

"Greendale" Semi-Smooth

This is a new and unusual texture and is the result of much study and experiment to meet the insistent demand for a brick in the large cities which will resist the effects of smoke and dust and still produce a light wall effect. The texture is sufficiently rough so as not to give a wall the glaring effect of a smooth brick, but still removes the objection which many architects and owners feel toward the use of rough texture brick.

"Greendale" Red Rug Brick

Manufactured from selected shale and burned to a rich Burgundy Red. Manufactured for blending purposes only and not offered for sale as a straight line.

"Greendale" Blends

Pontiac Potpourri — A combination of gray, brown, gun metal and red Rugs; especially appropriate for certain types of churches, apartments and residences. Color card on request.

Seville — A blend of "flashed" grayish brown shades which can be readily adapted to Spanish types of architecture. This blend produces a light wall effect yet the colors are neutral to dust and dirt. Color card on request.

561 Full Range — A blending of all clear burned Rug shades running from light ivory to dark buff. Natural cement or buff mortar color is very appropriate with this blend. Illustration on opposite page.

563 Full Range — A blending of all "flashed" Rug shades running from gray to gun metal. Effective when laid in natural cement or double strength chocolate mortar with raked joints. Color card on request.

Cordova Blend — A blending of colors ranging from light ivory through various tones of gray, buffs, pinkish hues and light tans. A vast assortment of shades beautifully blended. Illustration on opposite page.

Barcelona Blend — A special array of color in grays, buffs, lavender cast and light tan. Distinctive in appearance and unique in effect.

Knickerbocker Blend — Comprising an extremely wide color variation through all the shades of gray and buff into tans and light brown. Very striking and unusual.

261 Full Range (Semi-Smooth) — Is furnished in the same range of color as the 561 Full Range. (See color illustration on opposite page.) However, this color range can be modified by leaving out the lighter or darker shades so as to give a more uniform effect.

262 (Semi-Smooth)—Harmony of color and quiet in wall effect, is this "Greendale" Semi-Smooth shown in illustration on opposite page. The color range can be modified to suit the particular taste.

Plant and Facilities

"Greendale" Face Brick is manufactured at Greendale, Ohio, in one of the largest individual plants in the country. The tract consists of about 2200 acres containing deposits of rich clay ideally adapted to the manufacture of superior face brick. A tunnel kiln recently completed gives a capacity of about 32,500,000 bricks annually. Large production and central location insure prompt and efficient service.

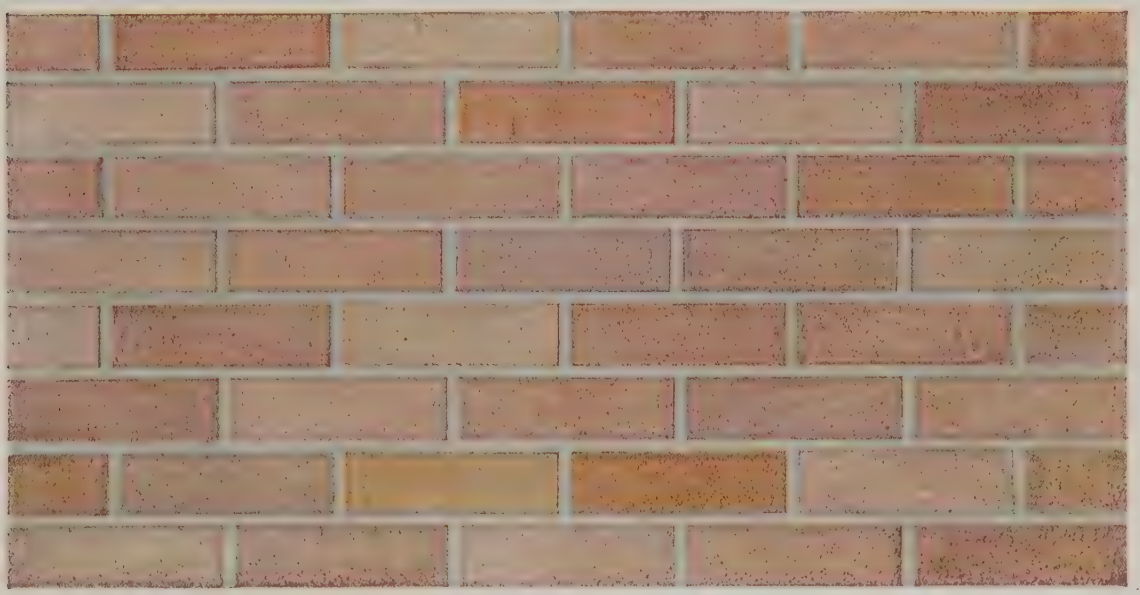
Information

"Greendale" distributors will be found in the principal cities where displays of brick may be seen and literature obtained. Samples are also on display at the Architects Samples Corporation, New York City. Inquiries addressed to our general offices at Logan, Ohio, will receive immediate attention. Samples and color cards on request.

Continued on next page

"Greendale" Cordova

A remarkable color range combining rare beauty, warmth and charm.



"Greendale" Shade 262 (Semi-Smooth)

An unusual texture produced in color tones particularly adapted to large structures.

"Greendale" Shade 561 Full Range

A wall of this shade is a study in masonry with every harsh feature common to other light brick eliminated. The same colors are produced in Semi-Smooth texture.

ESTABLISHED 1893

HANLEY COMPANY

Tunnel Kiln Face Brick

BRADFORD, PA.

NEW YORK OFFICE: 565 Fifth Avenue

BOSTON OFFICE: 260 Tremont Street

PLANTS: BRADFORD, PA., SUMMERVILLE, PA.

SALES REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products

All shades and textures of FACE BRICK in red, gray, buff, brown, golden, tangerine, manganese spot and white. In uniform shades or any blend or color combination desired. Court Brick, Imported Face Brick; Red Floor Tile.

TRADE-MARK

Hanley Face Brick—Available in All Colors and Textures

"Bradford Reds"—(a) Even shades in deep cherry red to a light red; available in dry press or wire cut. (b) Rich range of colors including greens, browns, tans, blues and reds. Also "Russets," a new blend containing ⅔ browns, tans, reddish tans and ⅓ red.

Hanley Buffs, Grays, Whites, Browns, Goldens, Tangerines—(a) Even shades in buff, gray, white, cream, brown, tangerine and golden. (b) Blends of practically any percentage of these colors which are desired to fit the architect's scheme for color.

Made in what is believed to be the largest and most modern tunnel kiln face brick plant in the world, these brick approach perfection in face brick, due to the unique process by which they are made. In the tunnel kiln process which was initiated in a practical way by the HANLEY COMPANY in 1921, and refined in 1925, brick are no longer burned in the beehive type of kiln with its large amount of manual handling and its resultant poor mechanical quality and heavy breakage.

Characteristics—Hanley Face Brick are made by a new process, introduced and developed by the HANLEY COMPANY, by virtue of which colors are predetermined and mixed to suit the architect, in contrast to the old type of brick plant which obtains a standard range of colors and does not have control over the percentage of shades and colors to be included in the blend. This ability to exactly mingle colors to order is a big step forward in the color possibilities of face brick, as any color combination can be chosen to blend with the roof, trim, shutters, entrance and landscape.

Court Brick

The practice of using "court brick" for light reflecting purposes in the tall structures being erected today, is growing with the increase in tall buildings. An additional usage for Hanley Courts is for basement interiors where, in 4-in. walls, both sides of the brick are exposed.

The Hanley Court Brick deserves special mention. It is not a discolored by-product, but is guaranteed to be free from dark headers or "flashings," mechanically an excellent product, and easy to lay. Hanley "Courts" will give a light wall effect far superior to that ever before offered.

Imported Face Brick

These handmade brick have received a widespread welcome from the leading residential and apartment architects in the country. They combine the non-mechanical features of imported brick with the soft, gently blending hues of yellow, orange, tan and red. Their use has been largely in suburban work where the color blend with shrubbery is very effective.

Red Floor Tile

Flawless surface, deep rich red color and impenetrable hardness are features which make Bradford Floor Tile distinctive. Made regularly in the following sizes and weights:

3x3 in., .55 lb. each; 3x6 in., 1.1 lb. each; 6x6 in., 2. lb. each; 4x4 in., 1.14 lb. each.

Territory Served

Due to the exceptionally high quality of Hanley Face Brick they are shipped to a wide territory, the Bradford Reds being sold regularly in thirty-two States east of the Rockies, whereas the white, gray and brown brick are distributed to an even wider territory.

Facilities

The name "Hanley" is a guarantee of the best products that 35 years' experience can produce.

Two of the most modern face brick plants in the world built on the *tunnel kiln principle,* enable us to promptly deliver red, gray and buff face brick in any quantity and in a number of distinctive types of smooth and rough texture.

Architects in thirty-two States have placed their confidence in Hanley products and have learned to depend on the character, reputation and stability of this progressive manufacturing concern.

Hy-tex Brick

The Standard of Quality in Brick
TRADE-MARK

Products

The Hy-tex Brick line embraces: Face Brick, Enamel Brick, Salt Glaze Brick, Equitable Brick, Paving Brick, Common Brick and Hollow Building Tile, Swimming Pools and Brick Mosaics.

Hy-tex Face Brick

The Hy-tex color range runs in face brick from the lightest colored creams, grays and buffs to the darkest reds and browns in smooth, semi-smooth and rough textures. It offers literally hundreds of various tones in the gray, buff and red basal colors. No matter what your requirements, whether for exterior or interior use, you will find in the Hy-tex line just the brick you want.

Specialties

Hy-tex Enamel Brick—Hy-tex Enamel Brick are unapproached in quality and durability by any similar brick of domestic or foreign manufacture. The "double-burn" process, an improvement over European methods, used exclusively in manufacturing Hy-tex Enamel Brick, eliminates the uncertainties present where the enamel is spread on the green brick and both are burned together with practically no control over varying fusion points, unequal expansion and impurities burning out as bubbles in the glaze.

Hy-tex Enamel Brick in the White and Ivory shades are absolutely opaque. Hy-tex Enamels will not craze, peel or discolor under the severest climatic tests, as proved by the experience of exacting architects in all parts of the country. They are made in White, Ivory, Green, Brown, Blue, Jade, Black, Transparent Speckled Buff, Transparent Speckled Brown, and are used extensively for facing large office buildings, theaters, stores, etc., as well as for hospitals, corridors, schools, gymnasiums, laundries, restaurants, bake ovens, garages, engine rooms, outdoor and indoor swimming pools, etc.

Hy-tex Enamel Court Brick are in every way the same brick, as to make and durability, as Hy-tex Enamels, except that, in sorting for first quality, these have been set aside because of slight surface defects which are not noticeable in courts or areas. Unless closely examined, they make the same appearance as Hy-tex Enamels and render exactly the same service. They have been used in many large buildings with complete satisfaction.

Hy-tex Salt Glaze Brick—Hy-tex Salt Glaze Brick, ranging from light straw to golden brown, as illustrated on next page, permit walls of light, medium, dark or mingled shades. Samples on request. The salt glaze, which forms an integral part of these brick, will not scale or peel under the most severe conditions, and is proof against moisture, dust, smoke, stains, germs, and even acids. These are widely used as exterior brick in business, wholesale and industrial sections of cities, and for interiors where light reflection, and bright, clean, sanitary surfaces are desired or necessary, as in corridors, stairways, vestibules, wainscots, light courts, gymnasiums, toilet rooms, engine rooms, food factories, garages, etc. The cost of Hy-tex Salt Glaze Brick closely approximates that of plastered and painted common brick, while its maintenance cost is less.

Two new shades, Ivory and Green Salt Glaze, have been added; samples on request.

Hy-tex Equitables—This brick was originally created for the *Equitable Building* in New York City, and has since been available in white and grays in various speckled effects. They present a smooth impervious surface and wash with the rain to their original clean appearance; and do not craze, scale or discolor under the severest climatic conditions. Suitable for both exterior and interior requirements.

Facilities

For over half a century the Hydraulic-Press Brick Company have been building the reputation which Hy-tex products enjoy today. During that time the Hy-tex organization has grown from one to twenty-two plants, scattered through the eight great clay-producing states. Branch office and agency distribution insures prompt and efficient service in all parts of the country.

Literature

This Company has issued booklets on Hy-tex Brick, Salt Glaze Brick, Hy-tex Enamel Brick and Equitable Brick; Brick Scales and Tables, a ready and convenient method of determining the number of courses and joints in all brickwork; Color Cards, and other material. For any of the above, apply to nearest branch office.

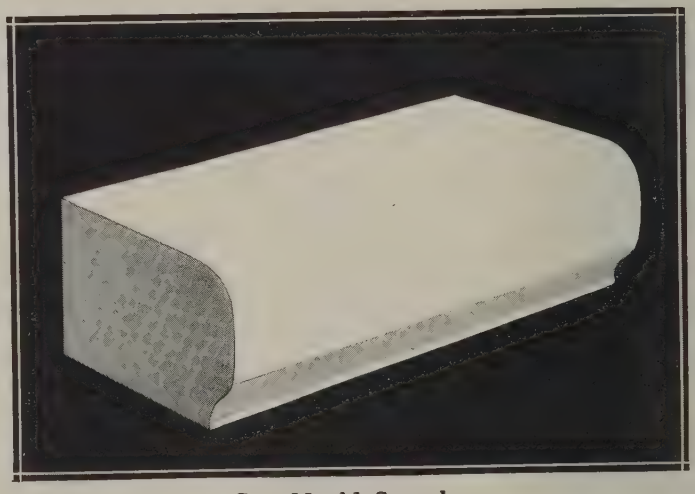
Ogee Stretcher



Cap Mould Stretcher

Basic Shapes in Hy-tex Enamel Brick

The enameled surfaces and shapes shown here, together with the stretcher shown in the color group, form the seven basic shapes in Hy-tex Enamel Brick. The series is completed by furnishing for the plane surfaces the stretcher and flatter, the quoins, headers, and the over- and under-dipping of the abutting surfaces—either wholly or in part.

For the moulded shapes, in addition to this over- and under-dipping which may be necessary to cover conditions arising in use, there are provided the complementary brick essential to their general use. These are headers, internal and external angle brick, returns and stops.

For detailed information, showing the various brick and combinations thereof, refer to shape book issued by this Company.

"Metro" Smooth Colonial Full Range Mingle—Shades No. 230-F to 280-F
These brick are particularly adaptable to produce English or Colonial effects. The markings, and blend of color, give the weathered effect so desirable on this type of work.

THE MEDAL BRICK & TILE CO.

Manufacturers of Face Brick and Tile

MAIN OFFICE
4900 Euclid Avenue
CLEVELAND, OHIO

PLANTS AT WOOSTER, MALVERN AND CARROLTON, OHIO
DEALERS IN ALL PRINCIPAL CITIES

Products

Medal Face Brick in a variety of colorings and surface textures, including side cut matts, end cut matts, vertical, die cut and sanded textures. Wooster and Carrollton clays produce red ranges of charming variety. Malvern clays afford a brown, buff and ivory color sequence which is available in straight shades or any specified mingling of shades.

Agecrost Oldstyle Brick, for reproducing the effect of antiquity found in classic models of European and Colonial building.

Also Medal Building Tile.

Surface Textures

Medal Brick are furnished in matt textures, vertical textures, and in a die cut as well as the distinctive Agecrost surface, which has been granted a United States patent for originality and merit.

Agecrost Oldstyle Medal Brick

This brick has the general aspect of an early, handmade brick plus the effect of long weathering. The influence of its surface treatment upon color is to soften and harmonize the brilliant colorings of the Medal Range and to increase their richness. The surface is neither acutely smooth nor systematically roughened. Minor irregularities of outline are preserved without extremity or affectation.

Squared or Beveled Edges—Agecrost brick are furnished with squared edges, or with edges irregularly beveled or rounded, thus increasing the scope of effects obtainable by different joint treatments. Either type of edge has exhibited splendid effects with full mortared or recessed joints in white mortar or color. Perhaps the most prized advantage of the beveled brick is the appearance of a smaller face, when full mortared, without departure from standard dimensions. Thus a mixture of squared and beveled brick, full mortared, gives the effect of pleasing variety of size and the appearance of undulation in the mortar line, without disturbing actual bedding levels.

Agecrost Window Brick

These brick comprise more than thirty specials from which to erect window openings for metal casement windows or double hung windows in harmony with the general exterior treatment of the building. The 3/8-in. flange against which the window frame is set gives added security and complete weather protection around the window.

The general design of these windows is based on English precedent, and they afford a consistency not otherwise found in brick construction, as well as marked beauty. Detail drawings are shown for double and single splayed windows, while the lettered illustration on this page is of a simple double splayed window. Variations of these types, including the use of a double mullion for a major division in a large window, will suggest themselves to the architect as soon as he is familiar with the material. Every construction difficulty has been solved and manufacture simplified so that these beautiful, chamfered brick windows can be specified with economy and certainty of result.

Bulletin and blue prints with full details of single, double and bay windows showing suggested application of trim for veneer and solid wall construction for casement or double hung frames, will be mailed to architects on request.

Agecrost Special Shapes

The architect will find many uses for the above window shapes, aside from window construction. Aside from these shapes, we are especially well equipped to execute orders to your own design for specials to construct chimneys, drip moulds, louvers, etc. The Agecrost surface treatment lends itself remarkably well to specials regardless of their shape.

Color Control and Sorting

Medal Brick are offered in a wide variety of colors. An original system of color control is part of the Agecrost technique, yielding a rich assortment of lighter reds, salmons, ochres and orange tints. With these come deep greens, blues and polychromes with dark and medium reds. A separate Malvern range is offered, varying through warm browns into buff and ivory.

All Medal Brick are sorted on coming from the kiln into piles of like color and re-combined in definite color mingles according to specification.

Co-operative Service

Factory representatives in all territories assist Medal dealers to solve special problems. Name of nearest dealer furnished on request.

ESTABLISHED 1900

SOMERS BRICK COMPANY

MANUFACTURERS

209 North Missouri Avenue

ATLANTIC CITY, N. J.

Products

"Somers" Variables, Reds, Colonials, Dull Finish Black Headers for Facing; Common Building Brick in the usual range. All brick of standard size.

History

The Somers Brick Company has been producing Sand finished brick by the "Soft Mud" process since 1900. The research and experiments of the company's specialists have achieved unusual results in the production of satisfactory brick for various effects. The wide range of brick produced by this company makes possible the reproduction of the color and texture of the "Colonial" brickwork of our ancestors with surprising accuracy and beauty.

Variables

These brick are just what the name indicates as to color. They are produced in red, black, brown, tan and flashed. A most pleasing and characteristic effect is accomplished by the use of these brick where "something different" is desired.

Reds

A stretcher with a kiln flash and range which produces a beautiful red tone; highly desirable for straight stretcher work. When used in conjunction with dull finish black headers, a "Harvard" effect results.

Colonials

A range of hard red brick, varying in color and shape. Especially well adapted to buildings where English bond with raked joints is to be used. This brick is also particularly suitable for garden walls, gateways and skintled brickwork.

Black Headers

Made with a dull finish to be used with Variables or Reds.

Rough Hard

A sturdy unit for foundations or interior walls with high compressive strength and low absorption.

Light Hard

A hard brick, light in color, very suitable for "backing-up" and guarding against a damp interior.

Production and Shipping Facilities

With a production of 80,000 brick per day and excellent shipping service on the Pennsylvania railroad, the Somers Brick Company is in a position to guarantee prompt delivery and freedom from annoying delays.

Services and Samples

The services of the specialists of the company are freely offered to the members of the architectural profession for consultation as to special effects which may not be covered by our regular production. Samples of brick and any other information gladly furnished upon request.

THE STARK BRICK COMPANY

Manufacturers of Stark Salt Glazed Brick

CANTON, OHIO

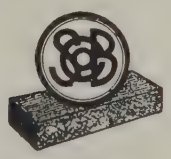
FACTORY, EAST CANTON, OHIO

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Product

STARK SALT GLAZED BRICK.

A smooth standard size (8x2¼x3⅞ in.) fire clay brick, glazed on the face, back and both ends. The glaze is a thin coating of glass fused with the body of the brick, which renders these surfaces impervious.



TRADE-MARK

Because of the ease with which they can be cleaned, Stark Salt Glazed Brick are used for a variety of special purposes, such as the walls of basements, gymnasiums, powerhouses, schools, lavatories, corridors, creameries, food product plants, laboratories, etc.

They can also be used effectively in fireplaces where the glaze makes them easy to keep clean.

Representation

In order to promptly and efficiently care for the needs of our customers, we have appointed agents in all the principal cities of the United States and Canada, who are constantly in touch with the factory.

A line from you will bring prices, samples, literature and any other information desired, from our nearest representative.

Colors

Stark Salt Glazed Brick are produced in a variety of colors. The glaze is applied during the burning process and being transparent, or nearly so, produces a very pleasing effect.

Shaded Brick—Brick as near as practicable a single color. These shades are designated by the following numbers: 50, 55, 60, 75, 80, 90, and 95. No. 50 is the light shade and No. 95 the dark.

Mingled Shades—A harmonious mixture of colors. We have three distinct mixtures as follows:

Gratones—A blend of gray colored brick.

Buftones—A blend of light buff colored brick.

Darctones—A blend of dark buff colored brick.

In addition to the above shades and blends of first quality brick, we have:

Courts—Brick having small defects (mostly handling chips), mingled in shade, light and dark.

Commercials—Brick having larger defects, including factory and kiln marks. This quality is the least expensive and is also free from crooked or warped brick. Mingled in shade, light or dark.

Nature and Uses

The process of cleaning a wall of salt glazed brick is similar to that of washing a window. Soap or washing powder and warm water are all the materials necessary. After washing, the wall should be thoroughly rinsed with clear water to avoid a cloudy effect when dry.

During the construction a little care in keeping the face of the brick free from mortar will avoid considerable expense and annoyance when cleaning for occupancy. In case the mortar has set on the face of the brick, an acid solution will assist in removing same without affecting the brick. Again it is necessary to thoroughly rinse the wall with clear water to prevent the acid from attacking the mortar in which they are laid.

Shape Brick

The illustrations on the following page show the various shapes carried in stock, and include bullnose, cap mould and cove shapes, with which almost any desired architectural effect can be produced. The 2-in. radius is standard.

Special shapes are made to order and require from two weeks to a month to produce.

Shipment of any of the standard shapes can be made immediately from yard stocks.

Our plant is one of the largest salt glaze brick manufactories in the world, having a normal capacity of three million brick per month.

Shipping Facilities

Our plant is located at East Canton, Ohio, on the Wheeling and Lake Erie Railroad, which is able to furnish abundant cars for all requirements.

WESTERN BRICK COMPANY

Manufacturers of Face Brick, Common Brick, Western Haydite and Featherweight Building Units

OFFICE AND FACTORIES
DANVILLE, ILL.

REPRESENTATIVES IN ALL PRINCIPAL CITIES OF THE MIDDLE WEST

Facilities

The WESTERN BRICK COMPANY manufactures annually 120,000,000 brick and tile at its two plants.

The shale and clay supply for these factories is practically inexhaustible; fuel supply is owned by the company in sufficient quantities to last at least twenty-five years.

TRADE-MARK

Shipping facilities are unequalled, as the product is distributed from Danville over seven railroads. Plants have side track room for about 75 cars, and ordinary daily shipments, during the building season, exceed 500,000.

Over 2,000,000,000 brick have been manufactured and marketed during the past twenty-eight years.

Face Brick

In order to simplify our lines for architects, we have developed various standard blends. To meet the demand for a distinctive type of brick giving that age old effect now so much in demand, we have produced, Early American "Handmades," Old English "Handmades" and Verde-Antique "Handmades." These blends are replete in reds of various hues, and the verde-antique are blended with a moss green brick. For those who prefer lighter tones, Spanish "Handmades" in buffs, grays and pinks may be specified. Other interesting blends are University Blend, Cloisters, Doric Chicago Blend, Mossblende's, and Green Persians.

FEATHERWEIGHT "HAYDITE" BUILDING UNITS

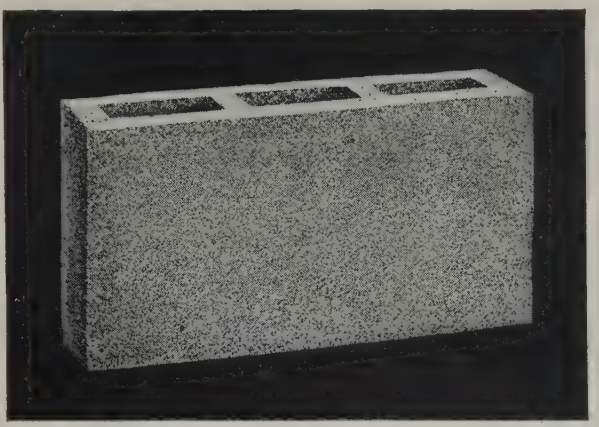
Made of Western "Haydite"

Featherweight "Haydite" building units embody all the requirements of perfect wall units and are offered to the building trade as light weight, economical fire resistant units for all types of wall construction.

Lightweight—57 lb. per cu. ft. of wall weight. 39% less than clay tile and 63% less than brick masonry.

Strength—All units heavy load bearing, meeting strength requirements of all local and State building codes.

Fire resistant—Fire resistance qualities have been completely established by Underwriters' Laboratories, Inc., of National Board of Fire Underwriters.



Featherweight "Haydite" Building Unit
4x8x16 inches

Nailing and Cutting—Nails are readily driven through wood trim into the unit and chaneling and cutting for water pipes and conduits can be done without breakage.

Insulation—Lower rate of heat conductivity than cinder concrete, clay tile or brick.

Damp and Vermin Proof—Owing to the cellular structure of the Haydite, moisture is not drawn through the unit.

Sound Insulation—Unequaled among fire resistant materials in the reduction of sound transmission. High in efficiency in the absorption of sound and especially adapted to the interior walls of auditoriums, churches and theatres.

Apply Plaster and Stucco Direct

Plaster and stucco is applied direct to the unit without lathing or furring. The unit being mechanically perfect, a large saving in amount of plaster can be made, only a thin straightening coat being necessary.

Shapes and Sizes

The unit is made in all standard shapes and sizes required by modern building practice.

Tests

Tests of this unit have been made by Underwriters' Laboratories, Inc; University of Illinois; Purdue University; University of Wisconsin; Robert W. Hunt Company; Pittsburgh Testing Laboratory; Riverbank Laboratories and Armour Institute.

Literature

Complete booklet treating all phases of the unit is available upon application to any authorized manufacturer or distributor of Featherweight "Haydite" Building Unit listed herein.

WESTERN "HAYDITE"

The Ideal Lightweight Aggregate

Western "Haydite" is a lightweight burned clay aggregate specially manufactured for use in concrete in place of sand, gravel, stone, slag or other aggregates.

Western "Haydite" is produced fom exactly the same shales as are used in the manufacture of the various grades of Western Brick, which have been used in many important buildings throughout the middle west during the past 28 years.

Western "Haydite" is burned in clinker form and then ground, screened and graded into standard commercial sizes.

Owing to its extreme lightness, it is the ideal aggregate for such pre-cast products as wall units, roof tile, laundry trays, burial vaults, conduit tile, lighting standards, telegraph poles and sewer pipe.

In reinforced concrete, a saving in steel area can be effected owing to the fact that concrete of Western "Haydite" weighs not to exceed 93 lb. per cu. ft., or 40% less than concrete with equal strength made from ordinary aggregate.

Absolute control of the sizing and grading; completely inert; free from all impurities; a preservative of metal; non-corrosive. An unlimited supply of the proper shales and fuel for many years to come together with adequate manufacturing facilities, make Western "Haydite" the ideal, dependable lightweight aggregate.

Western Brick Company maintains a service bureau to handle all matters in connection with Western "Haydite."

THE WYANDOT CLAY PRODUCTS CO.

UPPER SANDUSKY, OHIO

REPRESENTED IN ALL LEADING CITIES OF THE UNITED STATES

Product

FACE AND COMMON BRICK.
STANDARD SIZE and 4x5x12-IN. HOLLOW WARE.
SIDEWALK and TERRACE BRICK.

Composition and Manufacture of Wyandot Brick

An all-clay, genuinely sand molded brick, made from yellow clay which burns red. Variety and color flashing obtained by the location of brick in the kilns. Brick is burned to the fusion point of the clay.

Made by the same process as the handmade brick of years ago, but by machinery. Old-fashioned box molds lined with sand are used. This sand is part of the surface of brick, burned in and cannot rub off.

Ranges

Old Colony—varying shades of red, brown and gunmetal.

Sarouk—rose pink, bronze with rose hearts, lavender-blue.

Burgundy—deep wine red, plain and with purple-blue flashings.

Moss Rose—all one-color pink, with occasional very slight kiln flashing.

Wyandot Red—all one-color red, no flashing.

Elm—greenish-tan, tan and tan with pink flashing.

Commons

Hard Line—Not selected for color—vitrified—suitable for all outside purposes.

Backups—suitable for inside work only.

Contour and Texture

A slight irregularity of contour relieves it of any mechanical exactness. It has a soft, velvetv exterior over a flinty interior. Mortar adheres very readily to this surface.

Moisture Absorption

Tests from 1% to 5%.

Special Shapes

45° octagons, water tables, headers, stretchers, inside and outside returns, carried in stock.

Any type of special shape made from architects' blue prints.

Shipping Facilities

Factory is located on the Hocking Valley R. R. and the main line of the Pennsylvania.

Residence of R. A. Dress, Cleveland, Ohio

THE DELAWARE CLAY COMPANY

Manufacturers of Hollow Brick

DELAWARE, OHIO

Products

HOLLOW BRICK, HOLLOW BRICK HEADERS.

Also Standard Hollow Backing Tiles, Denison Interlocking Tile; Drain Tile, 3 to 30 in. diameter, inclusive.

Hollow Brick

Delaware Hollow Brick are standard brick size of design as illustrated. Their purpose is to back-up brick walls where insulation against dampness, heat and cold is desired. Also to lighten the loads on steel work and to eliminate furring, etc.

As hollow brick represent the safe medium between solid brick and hollow tile, partaking of the advantages of both, their use provides insulation without admitting the larger units of hollow backing tiles.

Supply

Having originated, developed and introduced hollow brick in the 90's, we built in 1901 a separate, especially designed factory to make this one article exclusively. The factory has operated continuously since then, turning out annually the largest hollow brick output in the world. Specializing in hollow brick alone in large volume, this plant has become headquarters for this product throughout the country.

Quality

To satisfy a general preference on the part of contractors for a moderately porous hollow brick, as it aids in stabilizing the wall when laid in unfavorable weather and provides the best type of plastering surface, we manufacture Delaware Hollow Brick from clay, instead of shale or fire-clay, by a special steam-press moulding process, under extreme pressure. Sufficient compression is obtained upon walls and webs to permit comparatively large voids without sacrifice of strength, which provide maximum insulation by increased dead air cells.

Cost

Delaware Hollow Brick weigh about 3 lb. each and may be shipped long distances economically. This company maintains at all times a lower price on Delaware Hollow Brick f.o.b. factory than current price on common brick. Therefore, the architect is safeguarded in specifying them.

Headers are furnished for header courses where required.

Products

VITRIFIED SALT-GLAZED CLAY WALL COPING.
FIRE CLAY FLUE LINING.

Vitrified Salt-glazed Clay Wall Coping

Vitrified clay wall coping can not wear out. Sun's heat and frost can not harm it. Moisture can not seep into and disintegrate it. Time can not discolor it.

The soft color of this wall coping blends well with almost any exterior treatment.

To give a smart finished look to the completed work and to insure its walls against decay for all time, specify vitrified salt-glazed clay wall coping.

Fire Clay Flue Linings

According to insurance and fire marshals' reports, at least three out of every ten residence fires start at the chimney—the unreliable chimney is the greatest single cause of residence fires. The architect can completely cut out that hazard in the work he designs by specifying fire clay flue linings for all chimneys and chimney openings and connections.

Product

CARNEY CEMENT.

CARNEY CEMENT
for Brick and Tile Mortar

Description

THE CARNEY COMPANY has manufactured cement since 1883.

Carney Cement is unlike others used in brick and tile construction. It is made from a peculiar deposit of stone found only at Mankato, Minn. This stone contains the correct proportion of lime combined chemically, so that, when the stone is burned and ground, it needs nothing but sand and water to form a smooth working mortar.

Advantages

Carney Cement is lighter in weight and more easily handled. It is packed in cloth or paper sacks, each containing 1 cu. ft. and weighing 50 lb. Users of Carney Cement are not required to buy lime, hence labor of slaking and mixing is eliminated. Carney Cement requires nothing but sand and water in mixing.

The simple mixing formula saves time and labor and eliminates the danger of carelessness. Addition of too much sand or adulteration at the mortar box interferes with the plastic, smooth-working properties of the cement and is immediately noticed by the masons.

Because of the plastic and smoother working properties masons can lay more brick per man per day. Carney Cement lays the maximum number of brick per barrel.

Carney mortar has no waste. Mortar left over at the end of a day or when a job is delayed can be used the next day by re-tempering with water.

Carney Cement can be used winter and summer. Frost does not affect the strength of Carney mortar in the wall. Printed directions on tags attached to the cement bags provide for its proper use in cold weather.

In the wall, Carney mortar returns to its native hardness, becoming harder than the brick it joins and as the mortar is absorbed into the brick it exerts a tremendous gripping power. It makes one solid wall of masonry.

Specifications for Brick, Tile and Terra Cotta Mortar

Plain Mortar—For all brick, tile and terra cotta mortar above grade, use 1 part Carney Cement to 3 parts sand, in accordance with the manufacturer's directions attached to the cement bags. Carney Cement mortar can be used for brick walls faced with Bedford stone without danger of staining the stone.

Colored Mortar—Use a good, double strength mortar color, and mix according to manufacturer's instructions.

Descriptive Literature

Literature covering every point on Carney Cement will be sent on request.

A list of buildings near you that have been laid up in Carney Cement, together with the names and addresses of the architects and contractors, will also be sent, if requested.

Carney Cement Test

Made by G. F. Gebhardt, Mechanical Engineer, Armour Institute of Technology, Chicago

A mortar of 1 part Carney Cement to 3 parts sand was used to make 14 piers, three bricks high, with ½-in. mortar joints—size of brick 3¾x8⅛x2¼ in.; area, 31 sq. in.

A pier was tested nearly every day for 16 days, on a Standard Olsen machine. The table shows the tremendous crushing strength reached on the 16th day.

While this test is more than sufficient for all practical purposes, it by no means represents the peak strength of a Carney joint—Carney Cement never stops hardening. In older specimens, the bricks themselves have given way without a sign of fracture in the joints.

CARNEY BREAKING LOAD

Designated age, days	Actual	Sq. in.	Designated age, days	Actual	Sq. in.

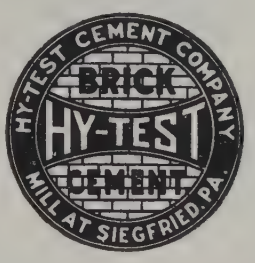
HY-TEST CEMENT CO.

Bricklayers' Cement

MAIN OFFICE
PHILADELPHIA, PA.
SALES OFFICES
NEW YORK, N. Y. WASHINGTON, D. C. BOSTON, MASS. PITTSBURGH, PA.
MILL: SIEGFRIED, PA.

Product

HY-TEST MASONS' CEMENT, a finely pulverized, plastic, smooth-working cement made especially for mortar for laying brick, tile, stone and other masonry construction.



MARK ON EVERY BAG

Advantages

Hy-Test Masons' Cement has an important property which is almost entirely lacking in portland cement, that of producing the "fat" mortar demanded by bricklayers.

The advantage of using Hy-Test is that it requires no addition of lime at the mortar box as is the case with portland cement, for it possesses the properties of producing a smooth working mortar when mixed with sand.

Architects will be quick to appreciate the fact that a mill finished cement that is self-contained and requires no addition of lime at the mortar box, will produce a more uniform quality and color of mortar than the uncertain mixtures of portland cement to which lime is added in varying quantities to suit the individual taste of each brickmason.

Strength of Hy-Test Mortar

The manufacturers guarantee that brickwork laid up in mortar under the simple directions of one (1) part Hy-Test mixed with three (3) parts clean sharp sand and clean water and cured under ordinary conditions, will withstand six times greater compression at the early period of 28 days than the highest stress on brickwork permitted by the building codes of all first class cities.

Lower Costs

In addition to these advantages, Hy-Test lowers the cost of brickwork, as it sells for substantially less than either portland cement or hydrated lime.

Composition

Hy-Test Masons' Cement is not a made-up mixture of cement and lime, nor is it a Rosendale cement. It is a true hydraulic cement made from the same raw materials as the highest quality portland cement under a fixed formula and under strict laboratory control, but by burning the raw materials lower than in portland, the desirable quality of smoothness is retained. In all other respects it compares with and accomplishes the required results in masonry construction as does portland cement.

Official Approvals and Tests

Hy-Test has been tested and officially approved by the building departments of New York, Boston, Washington, Philadelphia, and other large cities. Tests made by the Massachusetts Institute of Technology, George Washington University, and by eight other reputable testing laboratories are in evidence as to the uniformity and strength of Hy-Test.

Color

The natural color of Hy-Test is a pleasing buff, which makes it very desirable for face brick work. It can be colored in the same manner as portland cement.

Estimating Data

A barrel of Hy-Test consists of four cloth or paper bags totaling approximately 4½ cu. ft. of cement, and is ample, when mixed with ½ cu. yd. of sand, to lay 1000 brick, ⅜-in. joint.

Specifications

Mortar—Hy-Test Masons' Cement (HY-TEST CEMENT CO., Philadelphia, Pa.) or any other bricklaying cement that has been approved as equal in strength, shall be used for the mortar for laying brick and tile. Proportion the cement and sand loose, mixing one (1) part of Hy-Test with three (3) parts clean sand. The cement shall be delivered in closed bags and three (3) cubic feet of sand shall be added to each bag of cement. No counting by wheelbarrows or shovels will be permitted. In warm weather wet all brick. In cold weather use necessary cold weather precautions recommended by the manufacturer.

Appreciation

We respectfully submit that the best evidence of the merit of Hy-Test Masons' Cement is by the standing of the architects who approve and specify it, and the reputation of the contractors who have used and are using it. A partial list is given.

KOSMOS PORTLAND CEMENT COMPANY

INCORPORATED

SALES OFFICE

Starks Building, LOUISVILLE, KY.

MILL: KOSMOSDALE, KY.

Product

KOSMORTAR and KOSMOS PORTLAND CEMENT.

Kosmortar

A very smooth working cement for masonry of all kinds. Mixed with sand and water only, by hand or machine, it is ready for immediate use. No slaking. No additions. Minimum labor.

MASON'S CEMENT KOSMORTAR EASY TO SPREAD

TRADE-MARK

Characteristics of Kosmortar

Strength—Ample for all masonry. Makes mortar of about the same strength as a 50% mixture of portland cement and lime with much better working qualities.

Appearance—The natural color of Kosmortar is a light gray. It contains nothing that will react unfavorably on mortar colors, or cause efflorescence. Joints cut clean, giving a neat effect, and saving much labor. For practical purposes it is non-staining with Bedford stone.

Durability—Kosmortar passes the same soundness test as portland cement. Every step in its manufacture is under complete control and it may be depended upon for uniformity. Joints made with Kosmortar are water repellant to a high degree.

Set—Kosmortar is made slow setting to permit placing in the wall without retempering, which is never necessary with Kosmortar under proper management.

Package—Kosmortar is packed only in multiwall paper sacks weighing 75 lb. The unit of sale is a barrel of 300 lb., which means four sacks. Directions for use on each sack.

Amount Required—This varies with the sand used and the ideas of the various bricklayers. A good average is 4 or 5 sacks of Kosmortar to 1000 brick.

Kosmortar Tests

Report of Strength Tests—Made by R. W. Hunt & Co. in February, 1928.

Tensile Strength (1 to 3 mortar briquettes):

Age 3 days	78 lb. per sq. in.
Age 7 days	128 lb. per sq. in.
Age 28 days	171 lb. per sq. in.

Compressive Strength (1 to 3 mortar cylinders):

Age 3 days	521 lb. per sq. in.
Age 7 days	624 lb. per sq. in.
Age 28 days	1019 lb. per sq. in.

Kosmortar is guaranteed to meet the Federal Specifications Board Specification, No. 443, United States Government Master Specification for Masonry Cement.

Specifications

(1) Mortar for all masonry shall consist of Kosmortar (KOSMOS PORTLAND CEMENT COMPANY, Kosmosdale, Ky.) and good mason's sand alone in the proportion of 1 sack of Kosmortar to 3 cu. ft. of sand, with only enough clean water added to give a workable consistency. Mixing is to be done by machine wherever practicable. If the mixing is by hand the Kosmortar and sand shall be mixed dry until the whole is of a uniform color and the water then added, and thoroughly incorporated by further mixing. The mortar should be used as soon as possible after addition of the water.

Note: Slaking and soaking are not only not required, but are detrimental.

(2) In cold weather the sand and water shall be heated and the work protected, if necessary, to assure setting of the mortar before the water in it freezes.

(3) Porous brick, tile, and block are to be wet sufficiently to avoid drawing from the mortar joints the water required for hydration of the cement. This is particularly important in hot weather.

(4) When mortar color is used, a volume of sand equal to that of the mortar color shall be omitted from the mix.

LOUISVILLE CEMENT COMPANY

INCORPORATED

Speed Building

LOUISVILLE, KY.

Brixment Mills at Brixment, N. Y., and Speed, Ind.; Portland Cement Mills and Natural Cement Mills at Speed, Ind.; Lime Quarries and Plants at Milltown, Ind.

BRIXMENT for Masonry

Products

BRIXMENT, a mason's cement for brick, tile and stone masonry and for stuccoing buildings.

Also Speed Portland Cement, Louisville Natural Cement, Speed Chemical Lime, Speed Chemical Hydrated Lime and Speed Mason's Hydrated Lime.

For Brixment for stucco, see page B1775.

Brixment for Masonry

Brixment is a mason's cement that combines the characteristics of portland cement and lime, having both strength and plasticity. When mixed with sand and water, it makes perfect mortar for any type of brick, tile or stone masonry.

How Used—The proper mix is 1 part Brixment and 3 parts sand, measured by volume, with water added for proper consistency. Neither portland cement nor lime is necessary. The simple Brixment mix makes strong, smooth-working mortar.

Brixment can be mixed in any quantity either by hand or machine. It is ready to mix and use at once.

How to Estimate—Brixment is packed in cloth or paper sacks. Each sack contains 1 cu. ft. There are 4 sacks to a barrel.

When mixed with 3 parts of sand, a barrel of Brixment will lay between 800 and 1000 bricks, depending on the width of the joint. Therefore, 1000 bricks require 4 to 5 bags.

Uniformity—The use of Brixment is the architect's assurance that all mortar will be uniform in strength and color and that his specifications will be accurately followed. When oversanded, Brixment mortar works short and, since there is no lime in the mix, the necessary plasticity can be secured only by using the proper amount of Brixment.

Strength—The strength of Brixment mortar is greater than that required by the building code of any city for the heaviest load-bearing walls. Its strength increases with age. Its final strength is greater than that of the brick itself.

TEST BY ROBERT W. HUNT & COMPANY

Three specimens of Brixment mortar, mixed 1:3 with sand, were used in ½-in. joint between two common bricks. All were tested at the age of 28 days.

Specimen	No. 1	No. 2	No. 3
Mortar started to crush at about	20,000 lbs.	19,000 lbs.	23,000 lbs.
Brick started to crush at about	25,000 lbs.	24,000 lbs.	25,000 lbs.

TEST BY PITTSBURGH TESTING LABORATORY

Sample from warehouse of H. B. Rosenberger, Doylestown, Pa.

Fineness through 100-mesh sieve, 97.8% Fineness through 200-mesh sieve, 90.2%
Soundness in water, O.K. Soundness in air, O.K.
Initial setting time, 3 hours Final setting time, 6 hours
7-day tensile strength, 1:3 sand, 107 lbs. per sq. in. 28-day tensile strength, 1:3 sand, 232 lbs. per sq. in.

Bond—Brixment makes a stronger, tighter bond between the brick and the mortar. It is ground finer and hardens more slowly than portland, thus permitting deeper penetration and a more thorough keying into the pores of the brick.

Resists Moisture—During the process of manufacture a small amount of mineral oil is intimately mixed with Brixment. For this reason Brixment resists the passage of moisture through the mortar joint.

For Walls Below Grade—Brixment is a true hydraulic cement. This, with its water-resistance and freedom from lime, makes it ideally suited for walls below grade.

Convenient Setting Time—The manufacture of Brixment is controlled to give Brixment mortar a slower, more convenient setting time than portland cement mortar. This keeps the mortar from setting up on the board and enables the mason to strike the joints conveniently before the mortar has hardened.

Clean, Permanent Joints—Because of the slower set and unusually smooth-working quality of Brixment mortar, cleaner, neater joints can be struck. The absence of free lime keeps them from scaling, crumbling or popping.

No Efflorescence—Efflorescence is due to the presence of soluble salts in masonry materials. Brixment itself never causes efflorescence because it contains less than ½ of 1% of such salts. Even when soluble salts are present in the other materials, the water-repellent quality of Brixment resists the passage of the salts in solution and usually prevents them from coming to the surface of the mortar.

Does Not Fade Colors—Colors mixed with Brixment mortar develop and hold their full strength permanently. Brixment contains none of the acids and strong alkalis which are so frequently the cause of fading in portland cement and lime mortars.

Economy—Brixment costs less than the portland cement and lime necessary to make an equal amount of mortar. It saves labor because it requires no soaking or slaking and its plasticity enables the mason to do faster work. There is no waste of time and material because Brixment mortar sticks to the brick.

Specifications

(1) All mortar shall be composed of Brixment, manufactured by the LOUISVILLE CEMENT COMPANY, and sand. (2) The mortar shall be mixed by measure in the proportions of 1 part Brixment to 3 parts clean, sharp sand. (3) The Brixment and sand shall be mixed dry until the color of the mass is uniform. Clean water shall then be added to make mortar of the proper consistency for the work to be done. All mortar shall be mixed by machine (or by hand for small operations where machine mixing would not be practicable). (4) If mortar colors are used, they shall be mixed with the mortar in the proportion and manner specified by the manufacturer of the particular color used. (5) In freezing weather the sand and water shall be heated.

Clinton Mortar Colors
Nature's Permanent Colors—Made Since 1887—at Clinton, N.Y.

Experience

Ever since 1887, the CLINTON METALLIC PAINT COMPANY has served the architectural profession and the building trade. Over 40 years of scientific research and generations of manufacturing experience are reflected in the uniform excellence of Clinton products.

Permanent and Uniform

Clinton Mortar Colors are mineral colors, as permanent as the colors in natural rock. Rigid laboratory tests keep them absolutely uniform from shipment to shipment and from year to year.

Directions for Estimating and Using Clinton Mortar Colors

To get a mortar joint of intense color it is advisable to use approximately 100 lbs. of dry mortar color per

Mortar Colored with Clinton Pompeiian Buff No. 600

Mortar Colored with Clinton Double Strength Olive Green No. 1503

Mortar Colored with Clinton Special Chocolate No. 404

Mortar Colored with Clinton Colonial Buff No. 700

Continued on next page

1000 brick laid in running or common bond, with half-inch mortar joints. If mortar joints are wider or narrower, or if a bond requiring more or less mortar per 1000 brick is used, the amount of mortar color required per 1000 brick should be increased or decreased proportionately.

Following are two formulas for mortar of deep intense color:

Cement Mortar

Clinton Mortar Color (dry)	25 lbs.
Portland cement	1 bag (1 cu. ft.)
Sand	3 cu. ft.
Hydrated lime	1/10 sack

The above is sufficient to lay approximately 250 brick in running or common bond with half-inch mortar joints.

Cement Lime Mortar

Clinton Mortar Color (dry)	30 lbs.
Portland cement	1 bucket (16 qts.)
Hydrated lime	1 bucket (16 qts.)
Sand	6 buckets (96 quarts)

The second formula is sufficient to lay approximately 300 brick in running or common bond with half-inch mortar joints.

As it is not always convenient to weigh the color on the job, we tabulate below the various shades of Clinton Mortar Color, showing in separate columns the number of quarts of dry Clinton Mortar Color (*struck measure*) which are equivalent to 25 lbs. and 30 lbs.

Caution: This table applies only to genuine Clinton Mortar Colors.

	Number of quarts Equivalent to 25 lbs.	Equivalent to 30 lbs.
Clinton Hematite Red No. 10	10	12
Clinton Mortar Brown No. 400	8½	10½
Clinton D. S. Chocolate No. 402	9	11
Clinton Special Chocolate No. 404	9	11
Clinton Colonial Buff No. 700	19	23
Clinton Pompeiian Buff No. 600	19	23
Clinton Dark Buff No. 717	16½	20
Clinton Mortar Black No. 900	18½	22½
Clinton D. S. Black No. 800	19	23
Clinton D. S. Olive Green No. 1503	17½	21

Pearl Gray Mortar may be produced by using one-eighth as much Clinton Double Strength Black No. 800 as is recommended above to produce intense black mortar.

Clinton Mortar Black No. 900 or Single Strength Black, as it is sometimes called, will not give a jet black mortar. For best work use Clinton Double Strength Black No. 800.

For cream colored mortar a cement lime mortar or a cement mortar made with white cement and sand should be used, adding about half as much Clinton Colonial Buff No. 700 or Dark Buff No. 717 as recommended above.

Many contractors get good results with smaller proportions of Clinton Mortar Colors than those above recommended. This is possible if coarse sand is used and all ingredients are mixed, remixed, then mixed again. Experience, however, proves that the amounts of color recommended will give good results under all conditions and we cannot assure satisfaction if less color is used. Money spent for a little extra color more than pays for itself, in power and wages saved at the mixer and in the owner's satisfaction with the finished job.

Clinton Pulp Colors

Many users of Mortar Color desire the colors in Pulp form. Clinton Pulp Colors are of the same high quality as Clinton Dry Colors. Further detailed information with prices will be furnished upon request.

Specification

All coloring material to be manufactured by Clinton Metallic Paint Co., Clinton, N.Y., to be delivered on the job in original packages bearing their labels, and to be used according to directions which they will furnish.

Important Notes on the Preparation and Application of Colored Stucco

1. The Portland Cement Association, 33 West Grand Avenue, Chicago, will furnish any builder, without charge, detailed practical information concerning the preparation and application of colored stucco. Their instructions have been followed in the preparation of stucco panels reproduced below. The stucco was made in accordance with the following formula:

White Portland Cement	5 bags (470 lbs.)
Hydrated Lime	1 bag (50 lbs.)
Marble Dust	16 cu. ft.
Color	A weight equal to percentage of weight of cement indicated in table and under panels.

Any suitable white sand may be used in place of marble dust.

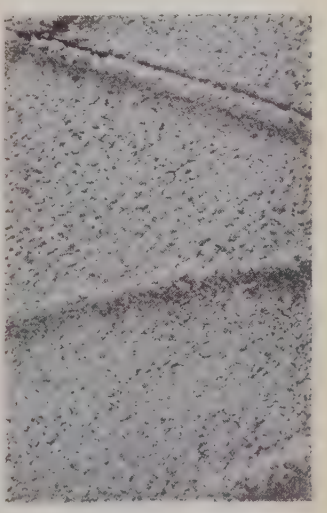
Shade	Clinton Color to be Used	Percentage of Color
Pink	Clinton Hematite Red No. 10	5 %
Pink	Clinton Red No. 82	1 %
Orange Pink	Clinton Red No. 61	1 %
Brown	Clinton Brown No. 1150	1.5 %
Deep Cream	Clinton Dark Buff No. 717	5 %
Cream	Clinton Colonial Buff No. 700	5 %
Light Yellow	Clinton Yellow No. 714	.75%
Light Green	Clinton Green No. 1502	1 %
Light Blue	Clinton Blue No. 1601	1 %

2. Any careful mechanic who will follow directions can prepare and apply colored stucco in a satisfactory manner.

3. Colored stucco appears much deeper in shade when wet than when dry. The change in color due to drying out of the stucco surface during the first few days after application must not be mistaken for fading. If Clinton Colors are used as suggested in our folder the final result should be closely similar to panels shown. Variations of fineness or color of the sand will account for such slight differences in color tone as may be noted. It is well to make up a small experimental batch, apply it, and let it dry out before proceeding with the work, thus proving that the color effect is satisfactory.

4. Write for our folder, "Color in Stucco," showing samples and giving more detailed information.

Background—No. 1502 Green 3%
Foreground—No. 61 Red 1%



No. 1601 Blue 2%

TRADE-MARK
Registered

Pecora Mortar Stains

Uses—A pulp or paste, *not a powder,* made in 11 standard colors. These stains are made to be mixed with lime or cement mortar or with the two combined. The stained mortars are universally appropriate and pleasing, whether used for facing exterior or interior walls and regardless of the type of structure. Stained mortar is also used for mantel facings, fireplaces and hearths, whether of brick, tile, marble, slate, or other material, and for pointing or joining stonework where a color effect is desired. Pleasing color tones may be introduced into exterior "white-wash" through the use of these stains.

Advantages—Pecora Mortar Stains are offered only in the form of a pulp or paste because this company has found after much experimental work that only in the pulp form can the stains be made to combine certain advantages.

They are absolutely fadeproof. Pecora Stains retain their original tones and the appearance of buildings is preserved as originally planned. These stains are exceptionally strong, which reduces the amount necessary for a given job and so cuts down handling. This strength also is responsible for the economy of its use and for the deep richness of tone that is obtained with Pecora Stains. The advantage of permeability in adding a pulp stain instead of hoeing dry materials into a wet mass of mortar is obvious.

The general acceptance of Pecora Mortar Stains as the standard of mortar colors is evidence that the pulp form is superior.

Properties—Pecora Mortar Stains are manufactured from carefully selected, finely ground, rich ores in combination with extenders and fixatives. These materials are dissolved in chemicals to produce a non-acid pulp. This pulp forms a chemical union with the mortar, and serves to strengthen rather than to weaken it. As the mortar sets, the colors become permanent making rich, clean tones, free from streaks and spots. Pecora Mortar Stains do not cause or increase efflorescence on the face of brick walls.

Colors—Shades below are always in stock. Special shades made to order.

Black	Windsor	Colonial drab
Brown	Red	Amber
Dark brown *(chocolate)*	Buff	Terra cotta
	Fern green	French gray

Specifications—The spotting and fading that results from the use of inferior materials, and the necessity for expensive tuck pointing as a result, may be avoided by the use of the following outline form:

All mortar to be colored or stained with Pecora Mortar Stain, manufactured by PECORA PAINT COMPANY, Philadelphia, Pa., using by measure 1 bucket of paste or pulp to 7 buckets of face wall mortar.

Mortar must be cold before mixing in stain. To secure a uniform and smooth shade, "hoe in" stain thoroughly. Keep soft in package by covering with water. Pour this off before using. Do not allow stain to freeze before being mixed with mortar.

Note: Depending upon depth of shade desired, the following proportions per 1000 brick, ordinary stretches, will be found to approximate quantity desired:

Red, Buff, Terra Cotta and Amber—For ⅛-in. joint use 45 to 55 lb.

Brown, Windsor, Colonial Drab, Fern Green, French Gray and Dark Brown—For ⅛-in. joint use 35 to 45 lb.

Black—For ⅛-in. joint use 20 to 30 lb.

Mortar varies and takes more or less stain according to richness of lime and quality of sand. Before laying brick it is suggested that a small portion of the stained mortar should be taken from the mortar bed and dried out thoroughly to determine whether the proper quantity of stain is being used to produce the shade desired.

Literature—Booklet, sent on request, showing actual colors and giving full details and photographs of important buildings, with testimonials from architects and owners.

Pecora Metal Sash Putty

Uses—A specially prepared putty for use in metal sash only.

Advantages—Pecora Metal Sash Putty is the modern plastic product developed by this company to replace white lead, litharge and ordinary putties used in connection with metal.

It is a "special duty" putty, compounded to retain its elasticity and adhesiveness and so to take up the difference in coefficient of expansion between glass and steel.

Properties—It remains soft in the package and is immediately ready for use when removed. It is "long" and therefore does not require manipulation by the workmen. This and its ease of application reduce installation costs.

Colors and Samples—The standard shade is dark gray. Other shades are made to order. Sample on request.

Specifications—The one safe way to specify is by name: Pecora Metal Sash Putty.

ANCHOR BRAND CEMENT COLORS.

Anchor Brand Cement Colors

Anchor Brand Cement Colors are very finely ground and produce clear, bright tones with a minimum of coloring material. They are used in floors, sidewalks, cast stone work, roofing and floor tile, stucco, etc., and should not be confused with mortar colors.

For Cement Floors—Although colored cement floors are comparatively inexpensive, they should never receive the treatment of a cheap floor. Colored cement, if carefully laid, finished and protected, will be found to possess all the decorative qualities of more expensive materials, along with the strength and economy of concrete.

For Stucco—The popularity of colored or tinted stucco surfaces is increasing rapidly. Directions for the use of our stucco colors will be furnished on request.

Available Colors—Our list of colors suitable for cement and stucco work is too long to publish here, but the more important numbers are given below. For special shades or tints, we will be glad to supply samples as requested.

No. 500	Red Oxide	No. 17	Dark Buff
No. 1195-B	Red Oxide	No. 1169	Brown
No. 1241	Red Oxide	No. 805	Brown

No. 1149-M	Yellow Oxide	No. 328	Blue
No. 5	French Yellow	No. 249	Black

Specifications for Coloring Cement Floors

Subfloors under colored cement topping should be specified as usual, although it is better to use a fairly dry mix and tamp thoroughly. Allow 1 in. for top dressing, which should be laid immediately. The following paragraphs should be incorporated in the specifications:

Cement Floor—Cement color, wherever specified, shall be Anchor Brand Cement Color, manufactured by C. K. Williams & Co., Easton, Pa., and delivered to site in original packages.

Top Finish—A top finish not less than 1 in. thick shall be applied to floors in (state part of work), topping to be composed of 1 part cement and 2 parts of sharp clean sand, free from loam, and from 3 to 10% of color, according to results desired.

Mixing—Cement, sand and color shall be thoroughly mixed before water is added. Only enough water shall be added to make a heavy paste. Mixing shall continue till the mass is absolutely free from spots or streaks of color.

Application—While base is still moist, top dressing shall be applied as follows: Trowel down about ½ in. of colored cement at a time, so as to work the air out of the mass. Build to the surface in this manner. Use the stroke board to chop the surface, as the mass will be too tough to stroke in the usual way. Take off any surplus with the trowel. Level the surface and let it lie till it becomes dull. Do not trowel until all water on the surface disappears.

Tile Effect (Optional)—48 hours after application of top finish, floors shall be cut ⅛ in. deep with a three-cornered file sharpened to a diamond point, so as to produce a tile effect in the pattern directed by the architect.

Note: Cutting floors while green will produce a ragged edge.

Protection—As soon as topping is sufficiently set, floors shall be covered with a 2-in. thickness of sawdust, which shall be kept wet for at least 2 weeks.

Cleaning and Waxing (Optional)—When protective coating is removed, the surface shall be washed with linseed oil soap, using a wire brush if necessary, to remove dirt and stains. When clean and dry, the surface shall again be covered with a 2-in. thickness of sawdust.

Just before the floor is to be put into use, it shall be polished with a floor wax approved by the architect and applied in accordance with the manufacturer's directions.

Anchor Brand Mortar Colors

The growing popularity of Mortar Colors during the past decade is largely due to the following reasons:

(1) Mortar to Match Brick—Where particular color effects are desired, such as in brick panels of contrasting or harmonizing color or for interior work, especially hearths, mantels, etc., the effects are greatly increased by coloring the mortar to match the brick. The American Face Brick Association standard specifications provide:

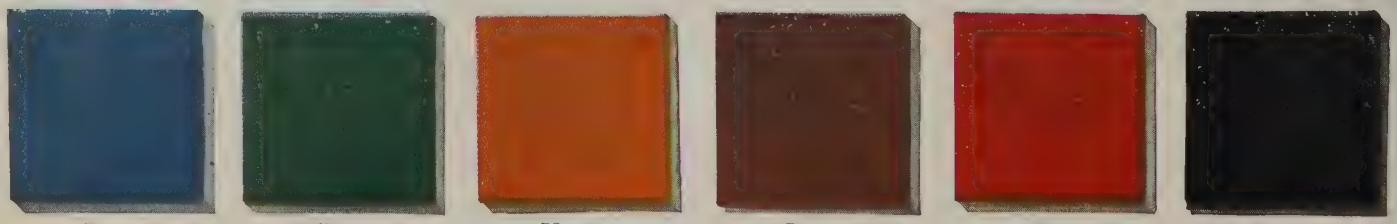
"The hearth shall be of (name) brick laid as per drawings in a 1:3 cement mortar to match the brick."

(2) For Mortar Contrasting with Brick—By laying the brick in mortar of a color and shade which will bring out the full value of brick texture and tone gradation, a beautiful effect is secured. Some combinations which have become very popular are as follows: rough texture variegated red brick with buff or chocolate mortar; red brick with black mortar; and smooth-surface light buff or yellow brick with red mortar.

(3) For "Mellowing" the Mortar—One of the principal charms of old brick buildings is the warm and mellow tone of the mortar. To reproduce the charm of half-century-old mortar, a judicious use of mortar colors will prove most satisfactory.

(4) For Color Control—The color value of sand and cement varies greatly with the source of material. Our standard specifications provide architects with an exact method of color control.

(5) One-fifth of the Brick Wall Surface Is Mortar—Proportions vary, but in the ordinary wall with ½-in. mortar joints, approximately one-fifth of the wall surface is mortar. For this reason architects realize the necessity of selecting the mortar color with the same discriminating care that is used in the choice of the brick.



BLUE GREEN YELLOW BROWN RED BLACK

Cement Floor Tile Colored with Anchor Brand Cement Colors

Continued on next page

Left

Five Range Rough Texture Brick Laid with Anchor Brand No. 19 Buff

188 lbs. Sand (2 cu. ft.)
94 lbs. Cement (1 bag)
9½ lbs. Hydrated Lime
15 lbs. No. 19 Buff

Right

Full Range Rough Texture Brick Laid with Anchor Brand No. 1151 Red

188 lbs. Sand (2 cu. ft.)
94 lbs. Cement (1 bag)
9½ lbs. Hydrated Lime
20½ lbs. No. 1151 Red

Anchor Brand Colors are manufactured in our own mills to meet the three essential requirements: *permanence of color,* so the mortar will not change its shade with age; *uniformity of color,* so that all batches of mortar in which a given color is used will be exactly alike; and *fineness of grinding,* so that the maximum coloring power is developed.

Colors—The following ten colors are standard:

No. 1151	Red	No. 19	Light Buff
No. 115	Red	No. 220	Single Strength Black
No. 1184	Brown	No. 222	Double Strength Black
No. 17	Dark Buff	No. 1174	Double Strength Chocolate
No. 18	Dark Buff	No. 257	Lime Proof Green

For special work we can supply special colors of any shade desired. Also some very good tints can be obtained by mixing the regular colors. Grays are obtained by using black sparingly, etc.

Sold in Dry Form—It is our experience that colors in the dry form are least expensive to the user and show the greatest coloring power per unit of weight.

Specifications for Anchor Brand Mortar Colors

The following paragraphs are to be inserted in the Brick Masonry specifications:

Mortar Color—Mortar color shall be Anchor Brand Mortar Color, manufactured by C. K. Williams & Co., Easton, Pa., and delivered to the site in the original packages.

Cement Mortar—All mortar for face brick work in (state part of work) shall be accurately mixed to the formula: 188 lbs. (2 cu. ft.) sand, 94 lbs. (1 bag) cement, 9½ lbs. hydrated lime, with the proper amount of Anchor Brand Mortar Color.

The exact quantity of color to be used will be decided by the architect after the construction of test panels.

Mixing—Dry color, sand, hydrated lime and cement shall be thoroughly mixed before water is added. After the water is added, mixing shall continue until the mass is absolutely free from spots or streaks of color. Mortar shall be mixed as stiff as is practicable, and batches shall be kept as nearly as possible at the same consistency throughout the job. The same proportions of ingredients shall be accurately maintained in all the batches. The kinds of lime, sand, cement and color shall not be changed after the work has begun. *See Notes (1) and (2).*

Test Panel—Test or sample panels as required by the architect shall be constructed in the same manner and of the same thickness as the finished wall. Face brick for test panel shall be laid in mortar mixed according to the formula and directions given above. After test panels are thoroughly dry, the architect will decide whether the color of the mortar is satisfactory, or whether the amount of mortar color in the formula should be increased or reduced. *See Notes (3) and (4).*

Cleaning and Pointing—When plasterer has left building, all surface brick and mortar shall be thoroughly cleaned down by applying a solution containing not more than 1 part of muriatic acid to 20 parts of water, using a stiff wire brush. Surface shall then be rinsed with clean water. All defective joints shall be pointed up at this time. *See Notes (5) and (6).*

Notes to Specifications

(1) *Lump Lime*—If lump lime is used in place of hydrated lime, it must be thoroughly slaked and allowed to cool at least 24 hours before being brought in contact with mortar colors. *Hot lime bleaches color.*

(2) *Accurate Mixing Necessary*—Lime is a strong pigment; sand and cement also have an important effect on color. It is important to measure accurately and maintain same proportions throughout the work.

(3) *Omission of Test Panel*—For smaller jobs where cost is an important consideration, the test panel may be omitted. In this case, a little of the mixed mortar may be taken from the first batch and pressed into a small cake. When this cake is dry, it can be determined whether the color of the mortar will be satisfactory.

(4) *Pigments Differ in Strength*—For this reason, a specific formula is given for the use of every mortar color.

(5) *Raking Joints*—Defer raking till mortar has begun to set.

(6) *Prevention of Efflorescence*—If mortar is mixed stiff and raking of joints deferred till mortar has begun to set, efflorescence will rarely be found. Efflorescence is in no way caused by Anchor Brand Mortar Color. It is due to the occurrence of soluble salts in cement, sand, lime, water or the brick, and is just as common in plain mortar as in colored mortar, though not so easily visible.

Special Facilities of C. K. Williams & Co.

C. K. Williams & Co. have a highly specialized organization together with mines, raw material deposits, and a plant equipment for the production of an extensive line of both natural and artificial pigments. At Easton alone, our plant buildings and storage space for raw materials cover more than 75 acres. Production of colors of maximum quality and uniformity has been the company's policy for fifty years.

APPALACHIAN MARBLE CO., INC.

Quarriers and Manufacturers of Appalachian Tennessee Marble
Manufacturers of Foreign and Domestic Marble

KNOXVILLE, TENN.

APPALACHIAN TENNESSEE MARBLE, especially for interior use, including Appalachian Golden Vein, Appalachian Champion Pink, Appalachian Roseal, Appalachian Special Silver Gray, Appalachian Dark Chocolate, Bond Pink, Bond Tavernelle and other Appalachian colors.

Foreign and Domestic Marble.

Floor Tile, Ashlar Marble Flagstones, Tennessee Granito.

Quality

Appalachian Marbles are non-absorbing, long wearing, strong and easily workable.

	Average
Co-efficient of absorption	.047
Tensile strength (transverse to bed)	1,554 lbs. per sq. in.
Tensile strength (with bed)	1,551 lbs. per sq. in.
Transverse strength (modulus of rupture)	2,686 lbs. per sq. in.
Compressive strength	18,274 lbs. per sq. in.

These tests made by U. S. Bureau of Standards and reported by T. Nelson Dale, Retired Geologist, U. S. Geological Survey.

Standard Thickness

Appalachian Marble is cut in standard thicknesses. They are (after honing and polishing): 7/8, 1¼, 1½ and 2 inches. Other thicknesses on order.

Floor Tile

Appalachian Tennessee Floor Tile comes in 8x16, 10x20 inches and 12 inches square, standard sizes. It can also be obtained in any special sizes the architect may desire for exactly carrying out his own ideas. It can be had in a wide variety of beautiful colorings.

Appalachian floors are low in initial cost, low in maintenance cost and last the life of the building. They are easy and economical to keep clean, materially reduce the dust nuisance and make for better health. They subdue traffic noise and afford a safe, comfortable walking surface.

8x16 and 10x20-inch tile are always on hand, and shipment can be made on receipt of order.

Ashlar

Appalachian Marble tile for ashlar, either hone or polish finish, can be furnished in our standard tile sizes at prices which make marble ashlar available for the comparatively moderately priced home as well as for more pretentious structures. This is because it is one of our by-products.

Tennessee Granito

Sizes No. 1, 2 and 3 for terrazzo floors. Crushed from Bond Pink Marble, making a dark, bright Pink Tennessee Granito.

Tennessee Marble Flagstones

For sun room, terraces, garden walks and stepping stones. Can be laid in distinctive and exclusive design, in shapes just as taken from our yard.

To meet the increasing demand for such uses of Tennessee flagstones, we have provided large storage facilities and can give immediate delivery.

Price

Because of quantity production Appalachian Marbles, although as beautiful as most fine foreign marble and superior in quality to the best of them, are a great deal cheaper in price than imported marbles, as well as like quality domestic marbles.

Installation

Appalachian Marble has been manufactured exclusively by us for sixteen years. More than $1,000,000.00 of it is sold annually in England, Canada, Latin America and every state of the Union.

Many of the most noted public and office buildings, churches, schools, theaters, hospitals, stores, banks, etc., have interiors, including floors and ashlar work, of Appalachian Marble.

Foreign Marble

Our established connections with the leading foreign quarries enable us to manufacture practically any desired foreign marble at a substantial cost saving.

Prompt Shipments, Low Rates

Huge production facilities and entire absence of labor troubles insure quick deliveries. Freight rates on marble from the Appalachian mill are estimated at commodity rates to all points in the United States and Canada.

Samples

Polished samples, showing the beauty of the Appalachian Marbles, will be sent to any interested architect or contractor, upon request.

Cost Estimates and Co-operative Service

The Service Department of the Appalachian Marble Co., Inc., welcomes the opportunity to co-operate with the architect. This co-operation reaches its highest state of efficiency when architects furnish the Appalachian Service Department with blue prints of the projects upon which they are working. The Service Department is then in a position to carefully estimate on work and offer all possible co-operation.

All Marble from One Source

Though a project may contemplate the use of foreign marble in addition to Appalachian Tennessee and other domestic marble, the complete cost estimate may be obtained from the Appalachian Service Department. Obtaining all marble from one source is not only a convenience but has definite shipping and price advantages.

Marble Working Drawings

Complete marble working drawings are made up by our drafting department to be used in submitting to the architects for approval as to jointing and for the securing of accurate Building Measurements.

Catalogue

A copy of the elaborate Appalachian loose leaf catalogue, illustrated in full colors, will be gladly furnished to architects and others interested in interior marble.

CARTHAGE MARBLE CORPORATION

Producers of Ozark Gray Marble, Veined and Veinless

QUARRIES AND MILLS

CARTHAGE, MO.

Product

OZARK GRAY MARBLE:

Sawed, Planed, Turned and Cut for polished interior and exterior work.

Facilities

The CARTHAGE MARBLE CORPORATION owns eight plants and quarries which include 55 gang saws, 25 polishing machines, 15 rubbing beds, 8 diamond saws, 12 planers, 11 traveling cranes, 30 channelers and 20 derricks.

Ozark Gray Marble can be furnished by marble or stone dealers anywhere in the United States or Canada.

Color and Texture

Veined Interior—A true gray with veins varying in color sufficiently to give life and beauty to the marble.

Veinless Interior—A soft gray, fine grained, monotone marble with a tinge of buff. Uniform in color, but with enough variation to be interesting.

Ozark Marbles, either veined or veinless, can be used economically wherever it is practical to use marble, and their neutral tones blend readily with any color scheme.

Exterior—White with a tinge of gray. Because of its wearing and non-stain qualities, its use is especially recommended for steps, base course, trim or entire building. Fabricated price for the exterior is, we believe, lower than for any other marble, and only slightly higher than for ordinary limestones.

Finish—On exterior work, sand rubbed finish shows up to best advantage on ordinary work, but where a special finish is wanted, rock face, bush-hammer or tooled may be used. It is susceptible to all finishes of any natural stone or marble, but polished finish is recommended for interior finish only.

Veining—Attention is called to the fact that this Company cannot agree to furnish Carthage Marble free from veins, which are characteristic of all marbles.

Analysis

Chemical analysis shows that Ozark Gray Marble contains nothing which can in any way discolor it. It is 99% calcium carbonate and is free from iron.

Non-absorbent

The raitio of absorption of this marble is 45/100 of 1%. Such a quality is of great importance in both exterior and interior work, for stains that cannot penetrate the marble can be easily removed from the face, a feature of great value in sanitary work.

Strength

The strength of Ozark Gray Marble is such that it stands all tests subjected through various kinds of work. Its crushing strength is about 18,000 lb. per sq. in., which is considerably more than is required in any building work.

Short Specifications

Exterior Work—All cut stone to be of properly selected Carthage building stock, as furnished by the CARTHAGE MARBLE CORPORATION, Carthage, Mo. Veining averaging ¼ in. or less, if tight and sound, is permissible anywhere in the face of the marble.

All steps, door and window sills, coping and projecting courses shall be cut to lay on the natural bed. Base, belt courses, ashlar, lintels, etc., shall be set on edge. On marble set on edge, veining shall not intercept the face but clouded faces are permissible.

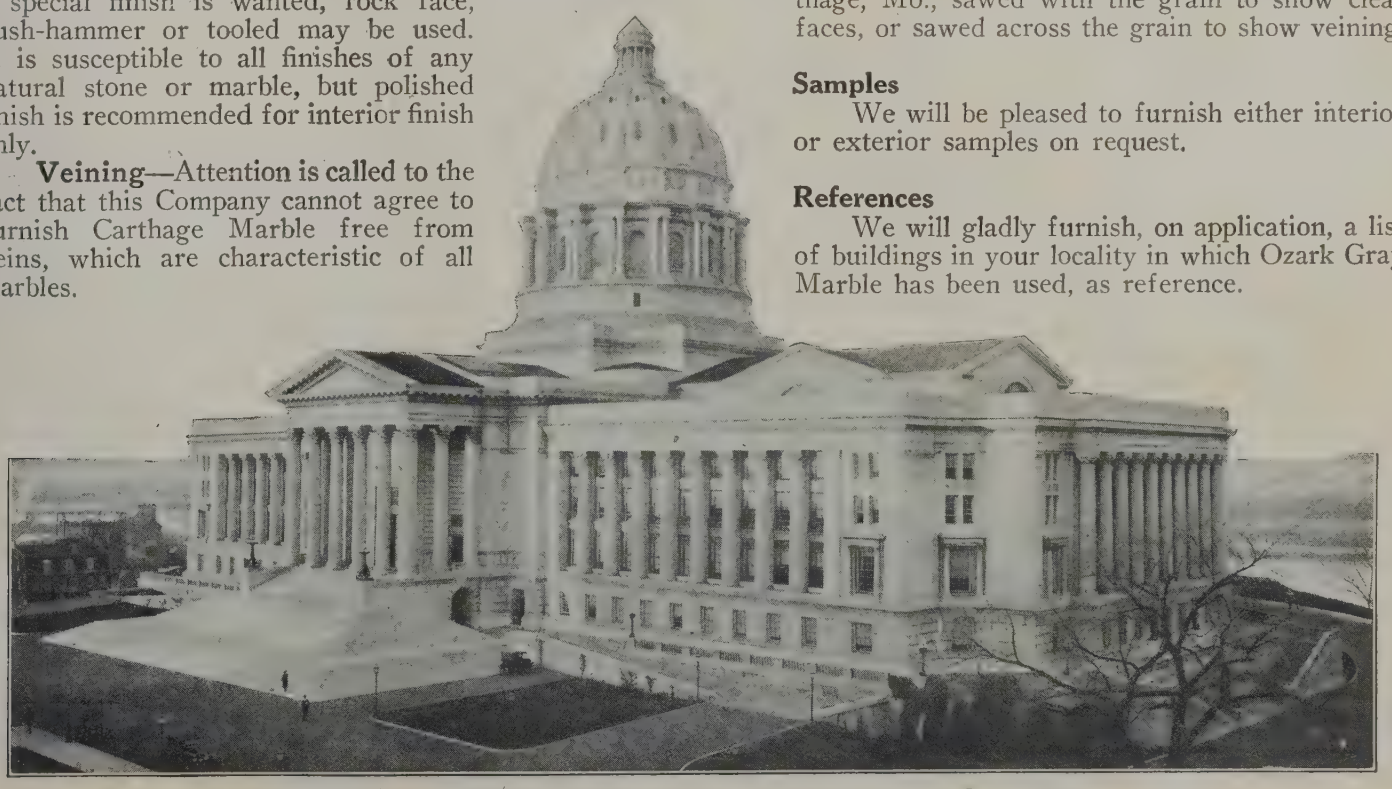
Interior Work—Marble to be Ozark Gray as furnished by the CARTHAGE MARBLE CORPORATION, Carthage, Mo., sawed with the grain to show clear faces, or sawed across the grain to show veining.

Samples

We will be pleased to furnish either interior or exterior samples on request.

References

We will gladly furnish, on application, a list of buildings in your locality in which Ozark Gray Marble has been used, as reference.



Missouri State Capitol—Ozark Gray Exterior and Ozark Gray Interior

THE GEORGIA MARBLE COMPANY

TATE, GA.

BRANCH OFFICES

ATLANTA, GA., 511 Bona Allen Building
CHICAGO, ILL., 456 Monadnock Block
NEW YORK, N. Y., 1328 Broadway—Telephone, Wisconsin 6574

Products

GEORGIA MARBLE for exterior and interior building and monumental work.

Rough quarry blocks, sawed stock or finished work in the following marbles produced by us: "WHITE," "LIGHT CHEROKEE," "SILVER GRAY," "MEZZOTINT," "CREOLE," "VERDE ANTIQUE" and "PINK."

Durability

Georgia marble, owing to its dense, flawless, crystalline formation and non-absorbing qualities, does not disintegrate. It will stand the test of time, as proved by use in many fine buildings and memorials.

Colors

"White"—This company operates four quarries of white marble ranging from almost pure white to white with more or less dark marking, known as "White Georgia" and "Kennesaw."

"Light Cherokee"—A very light gray with clouding and veins running in waves well distributed.

"Silver Gray"—A uniform pearl gray, practically free from marking.

"Mezzotint"—Gray background with rather heavy dark marking occurring in waves, between "Silver Gray" and "Creole."

"Creole"—Heavily veined and having white background with black and bluish black veining and figures.

"Verde Antique"—Ranges from medium green to dark green with light colored veins.

"Pink"—Ranges from a very light salmon to a deep old rose with very warm tints.

Physical Properties of Georgia Marble

Crushing Strength—Tests by the Ordnance Department, United States Army, show crushing strength to be from 11,000 to 16,000 lbs. per sq. in.

Analysis—Georgia marble is by analysis, over 98% pure Carbonate of Calcium.

Statuary

The "White" and "Silver Gray" Georgia marble are unexcelled for sculpture work exposed to the weather. The marble is unaffected by the most severe weather. Large sizes can readily be obtained.

Columns and Monoliths

Special attention is given to the production of long columns in one piece. The company has furnished monoliths 30 ft. long by 4 ft. diameter.

Facilities

Facilities for production and finishing are unexcelled. Eight quarries are operated, which will easily produce 1,000,000 cu. ft. per annum. The equipment of the four plants consists of upwards of 100 gang saws, 22 rubbing beds, planers, lathes, diamond saws, carborundum machines, etc.; and with an unlimited supply of marble any size order can be accurately and promptly filled.

CHARLES J. SIMON & COMPANY

Designers and Workers in Stone
Wood and Stone Carving, Sand Etching, Marble Screens

1910-1930 Brighton Road, N. S.
PITTSBURGH, PA.

Product

INLAID MARBLE MOSAIC.

Brief Description

The modern inlaid Marble Mosaic, developed and patent applied for by CHARLES J. SIMON & COMPANY, presents a new idea in marble decoration for those of discriminating taste. The process of manufacture consists of several steps. The design is first traced on the marble and then cut out to a depth of ¼ inch with special tools. In this cut is placed colored mastic which forms the design and makes an everlasting decoration in the marble.

Possibilities and Uses

The possibilities in connection with the artistic uses of this new development will be apparent at once to every architect. For walls, floors or ceilings any type of design may be carried out in marble. Any number of colors may be used, the range of combinations is almost limitless.

Emblems, panels, portraits, figures and ornaments can now be produced in marble with all the delicate coloring and shading of that beautiful stone.

Wherever the choice of materials is limited, wherever the color of marble offers the best solution of your problems, you can now have your designs executed in stone at a moderate additional cost to the plain marble.

Inlaid Marble Mosaic is especially suitable for use in altars, pulpits, floors, wainscots, banks, memorial halls, hotel lobbies, theaters, bathrooms, showrooms, etc.

Special Work

All work is done especially to order. Architects are invited to send their designs to the company for estimates of cost. The design staff of the company will be glad to co-operate in securing unusual effects.

Your local marble companies may also be consulted.

Facilities

The company has large sawing mills and finishing plants in Vermont; also finishing plants in Philadelphia, Cleveland, Chicago, Dallas, San Francisco and Tacoma. At the last-named plant is the storage yard for the Alaska marble, which can be shipped from there in rough or finished state. Alaska marble can also be supplied from any of the other plants.

Varieties

Exterior—Mountain White Danby, Imperial Danby, Highland Danby, Corona, Eureka and Pearl Gray Vermont.

Interior—*Vermont Marble*—Over 40 varieties, including white, lightly clouded and veined; gray, light green and dark green; red and black.

Alaska Marble—Several different kinds, the predominating color being pearl white veined with gray or black.

Physical Properties of Marble

Tests made by the United States Bureau of Standards show Vermont marble to have an ultimate crushing strength varying from 11,000 to 16,000 lb. per sq. in.

Tests made by the United States Bureau of Standards show that Danby Vermont marble, a variety much used for exterior purposes, absorbs about one-tenth of one per cent by weight when immersed in water.

Suggested Specifications for Exterior Marble

Material—All cut stone work shall be (insert name of variety of marble wanted).

Quality—All marble entering into the construction of the work shall be selected for uniform color. It must be free from cracks, chips, stains, or other defects upon exposed surfaces.

Samples—Before proceeding with the work the contractor shall submit a sample 4x8x2 in. of the marble he proposes to use. One face of this sample shall have (specify what finish is desired).

Joints—All marble shall be cut for $\frac{3}{16}$-in. joints.

Finish—All exposed surfaces of marble work shall have (specify desired finish).

Drawings—Detailed drawings will be furnished by the architect for all work requiring them. The contractor shall make and submit for the architect's approval, shop drawings showing in plan and elevation the dimensions of all stones, position of joints, and the spacing of dentils or other repeated ornament.

Cutting—All cutting must be done in a workmanlike manner and in accordance with the shop drawings referred to. All faces shall be free from winds, so as to present a true and even surface. Joints shall be at right angles to the face. Intersecting profiles shall be accurately cut. Re-entering angles of mouldings shall be cut from the solid, unless otherwise shown by the drawings. The contractor shall, where called for by the architect's drawings, cut the marble work to accommodate steel, flashings, leaders or other structural materials.

Delivery—All marble shall be crated or otherwise protected so as to be delivered at site in good condition.

Storage—All marble stored at the site shall be on cleats, off the ground, and protected where necessary from any stains from above.

Setting—Marble shall be set with a derrick and in full bed of mortar. The mortar-bed shall be kept back at least 1 in. from the face of the stones.

Mortar—Mortar for setting marble shall be composed of 1 part white non-staining portland cement, 3 parts clean, sharp sand and a quantity of hydrated lime equal to 10% of the volume of cement.

Institute of Arts, Detroit, Mich.—Vermont Imperial Danby Marble
Paul P. Cret and Zantzinger, Borie & Medary, Architects

Continued on next page

Protection—During construction, all sills, moulding, or other work liable to injury shall be suitably protected by boards which shall not be removed until the cleaning and pointing is done.

Anchors—Anchors to be of wrought iron, heavily galvanized or painted 2 coats with an approved brand of dampproofing paint and allowed to dry before using. For each stone 2 ft. long one anchor shall be used, and for each stone over 2 ft. long, at least two anchors. Provide suitable clamps at corners and such special anchors as the architect may direct. Balusters shall be doweled top and bottom with brass, copper, zinc or some other non-staining metal.

Pointing and Cleaning—All exposed surfaces of the building shall, on completion, and when directed by the architect, be cleaned with clean water only and fiber brushes. All joints shall be raked out, 1 in. back from the face, and carefully pointed with a mixture of 1 part white non-staining portland cement and 2 parts clean white sand. Joints shall be ruled with a tool of approved shape.

Vermont Interior Marble Service

We contract either for interior marble work installed or to finish and furnish it to local interior marble dealers, following whichever method will give best service to architects, contractors and owners.

Suggested Specifications for Interior Marble

Material—All interior marble shall be as follows: All toilet marble, Vermont Venoso; all corridor marble, Vermont Brocadillo. (Always insert the name of the desired grade, avoiding the too general term "Vermont Marble.")

Quality—All interior marble shall be of good quality, free from stains. Patching will be permitted only where the natural imperfections of a particular stone are subject to correction by the established usage of the industry.

Samples—Before proceeding with the work the contractor shall submit to the architect samples of all the marble specified above, 1 ft. square and 7/8 in. thick.

Finish—All floors and stair treads shall have a fine sand finish. All standing marble shall be highly polished.

Drawings—Detailed drawings will be furnished by the architect for all work requiring them. The contractor shall make and submit for the architect's approval, shop drawings showing proposed jointing.

Measurements—Before proceeding to finish the interior work the contractor shall verify all measurements at the building.

Cutting—The marble contractor shall do such necessary cutting and fitting to accommodate his work to other trades as is sanctioned by common usage in the trade.

Setting—All floor marble shall be set in a cement mortar of 1 part cement and 3 parts sand, adding a quantity of hydrated lime, not exceeding 10% of the volume of cement. The concrete fill must be swept and thoroughly sprinkled before setting is started. All stair treads and all standing marble shall be set in plaster of paris. All wall marble shall be securely anchored with brass, copper or aluminum wire.

When work is completed all marble shall be cleaned and left in good condition.

Classes of Work Supplied

Wainscot and interior decorative treatment generally: floor tile, stair treads, bank screens, counter tops, soda counters, electric switchboards, scale tops, lamp bases, and many other purposes.

Adaptability

Innumerable are the ways in which Vermont marble may be applied to building construction. Nor is it merely a beautiful product. It is thoroughly sanitary as well as fireproof, though it may be readily cleaned. It needs no refinishing. Although initial cost of marble may be slightly in excess of certain other materials, in the end it is no more expensive.

Marble Exhibit in New York City

There is an exhibit of large-sized samples of our marbles at our New York office in the Architects' Building, 101 Park Avenue, to which architects, engineers, contractors and owners are cordially invited.

"The Book of Vermont Marble"

A brief compendium of our products and the best ways to use them; our facilities; a number of drawings and details showing most approved methods of construction in exterior and interior marble work, etc. Contains 65 pages, of standard architect's size. Furnished without charge to any architect upon request.

CLASSIFICATION OF BUILDING GRANITES

Quarried and cut by Association Members

White, Gray, Lavender, Pink, Red, Green, Buff, Brown

Name of granite	Producer and manufacturer	Location of quarry	Grain	Color	Technical classification
Bethel White	Woodbury Granite Co., Inc., Burlington, Vt.	Bethel, Vt.	Coarse inclined to medium	White faintly mottled with gray	Quartz-monzonite
Mount Airy	North Carolina Granite Corp., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray	Biotite
Mount Airy	North State Granite Co., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray	Biotite
Mount Airy	Mt. Airy Granite Cutting Co., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray	Biotite
Mount Airy	J. D. Sargent Granite Co., Mt. Airy, N. C.	Mount Airy, N. C.	Medium	Very light gray	Biotite
Chelmsford White	H. E. Fletcher Co., West Chelmsford, Mass.	West Chelmsford, Mass.	Medium	Very light gray	Muscovite-biotite
North Jay	Maine & New Hampshire Granite Corp., North Jay, Me.	North Jay, Me.	Fine	Very light gray	Biotite-muscovite
Chelmsford Gray	H. E. Fletcher Co., West Chelmsford, Mass.	West Chelmsford, Mass.	Fine	Light gray	Muscovite-biotite
Milford, N. H.	Lovejoy Granite Co., Milford, N. H.	Milford, N. H.	Fine inclined to medium	Light gray	Quartz-monzonite
Concord	John Swenson Granite Co., Concord, N. H.	Concord, N. H.	Fine to medium	Light to medium gray	Muscovite-biotite
Connecticut White	Booth Bros. & Hurricane Isle Granite Co., 208 Broadway, New York, N. Y.	Waterford, Conn.	Fine	Medium buff gray, hammers light	Quartz-monzonite
Westerly Blue-White	New England Granite Works, Inc., Westerly, R. I.	Westerly, R. I.	Fine	Bluish gray	Quartz-monzonite
Barre (Light, Medium and Dark)	Marr & Gordon, Inc., Barre, Vt.	Barre, Vt.	Fine to medium	Light bluish gray, medium bluish gray and dark bluish gray	Biotite
Woodbury Gray	Woodbury Granite Co., Inc., Burlington, Vt.	Woodbury, Vt.	Medium	Medium gray	Biotite
Rockport Gray	Rockport Granite Co., Rockport, Mass.	Rockport, Mass.	Medium to coarse.	Medium gray, slight bluish green tinge	Hornblende
Chelmsford "Bulfinch"	H. E. Fletcher Co., West Chelmsford, Mass.	West Chelmsford, Mass.	Fine to medium	Light grayish buff	Muscovite-biotite
Somes Sound	Booth Bros. & Hurricane Isle Granite Co., 208 Broadway, New York, N. Y.	Mt. Desert, Me.	Coarse inclined to medium	Light grayish buff	Biotite
Goss Pink Deer Isle	John L. Goss Corp., Stonington, Me.	Crotch Island, Stonington, Me.	Coarse	Pinkish, lavender tinted, medium gray	Biotite
Conway Pink	Maine & New Hampshire Granite Corp., North Jay, Me.	Redstone, N. H.	Coarse	Light pink mottled with large gray and small black spots	Biotite
Jonesboro	Booth Bros. & Hurricane Isle Granite Co., 208 Broadway, New York, N. Y.	Jonesboro, Me.	Coarse inclined to medium	Pinkish gray	Biotite
Red Westerly	New England Granite Works, Inc., Westerly, R. I.	Westerly, R. I.	Medium inclined to coarse	Reddish gray, speckled with black	Biotite
Moose-a-bec Red	Rockport Granite Co., Rockport, Mass.	Jonesport, Me.	Coarse	Dark reddish gray with white and pinkish feldspar	Biotite
Ausable Mottled-Green	Marr & Gordon of New York, Barre, Vt.	Ausable Forks, N. Y.	Coarse	Light grayish green, coarsely mottled with black and bluish spottings	Anorthsite
Rockport Sea-Green	Rockport Granite Co., Rockport, Mass.	Rockport, Mass.	Medium to coarse.	Dark olive-green-gray with black spottings	Hornblende
Conway-Green	Maine & New Hampshire Granite Corp., North Jay, Me.	Redstone, N. H.	Coarse	Dark yellowish-greenish-gray with black spottings	Biotite-hornblende
Rockport Seam-Face	Rockport Granite Co., Rockport, Mass.	Rockport, Mass.	Medium	Dark yellow-brown, bright rust-brown, light yellow-brown	Hornblende

Granite and Its Architectural Qualifications

Natural Qualifications

Granite has exceptional strength and durability, is practically non-absorbent, and indefinitely withstands exposure to climate and weather. It is available in a wide range of colors and textures and has inherent beauty and character to be found in few other materials.

Granite may be cut into any form desired and dressed in a great variety of finishes. It takes a high and durable polish which will withstand long exposure to the weather. It may be carved with as much refinement of detail as desired. Granite is pre-eminently suited by Nature for exterior architectural uses, and its natural qualifications are unsurpassed and rarely equalled by any other building stone.

Description

Granite is technically described as a holocrystalline, granular rock of igneous origin. The essential constituents are quartz and a potash feldspar. The principal accessory mineral is usually either mica or hornblende. Other minerals occur in small quantities, but are generally secondary to those mentioned.

The accessory mineral, mica, occurs in two forms—black mica or biotite, and white mica or muscovite. The hornblende in building granite is usually black or a very dark green.

Granites are technically classified by the predominating accessory mineral. The most common varieties of building granites are known as biotite, muscovite, biotite-muscovite, muscovite-biotite, hornblende, biotite-hornblende, and quartz-monzonite granites.

As a general rule the color of granite is determined by that of its feldspars, and the hardness by the quartz and feldspars, varying according to the proportion and hardness of the feldspars.

Colors and Textures—The granites produced by Association members include many shades of gray, lavender, pink, red, green, brown, buff and white.

Natural texture varies according to the distribution and size of crystals of the constituent minerals. Granite is graded, as to grain, by the size of its feldspar crystals, from very fine to very coarse. The size of crystals or coarseness of grain has practically no bearing on the structural qualities, but gives to granite the variety of texture which adds greatly to its architectural possibilities.

Physical and Chemical Tests

The standard building granites produced by Association members so far exceed all ordinary architectural requirements as to physical and chemical properties, that specific data on tests have little or no bearing upon the relative architectural merits of the different granites.

In confirmation of this the following extracts from a statement prepared by George F. Laughlin of the United States Geological Survey are appended:

"Physical tests have supplemented actual experience in the use of granite by showing that it exceeds the requirements for the tallest and most exposed buildings to a great degree. With this fact demonstrated, the actual results of strength and porosity tests are of little significance; far less than an accurate knowledge of the component minerals and their state of preservation as revealed by the microscope."

"Only when monuments of solid masonry and of unusual height are to be erected or when paving stone for extremely heavy traffic is to be laid, do crushing tests of granite need any consideration."

"Transverse breaking strengths of granite are also quite adequate to support any load that they are expected to support in buildings."

"Unweathered granites such as are supplied to the high class building trade are for all practical purposes absolutely impervious, except close to the surface of blocks where minute cracks have been developed during splitting or tooling."

"The time necessary for unweathered and properly fabricated granite to show appreciable effects of weathering in buildings is too long to cause concern except for monumental structures intended to last for thousands of years."

"Chemical analyses of granite, as usually recorded, are of little or no value from the builder's standpoint. For proper interpretation they require microscopic study. Such study supplemented by examination of the granite in the quarry and in the building, will disclose the essential facts regarding weathering qualities and other important questions."

Standards of Quality

It will be noted under "Physical and Chemical Tests" that these standard building granites come well within all possible requirements of architectural use, so that standards of material are unnecessary. The cutting properties of the granites from different quarries vary quite materially and it would be very difficult to define standards of workmanship.

Quality of workmanship has been graded by usage into three classifications, which, while somewhat elastic and difficult to define exactly, are pretty well established and recognized by the manufacturers.

Monumental Building Grade—For permanent buildings designed to perpetuate public pride or civic spirit, where utility and economy are subordinate to architectural merit, such as State house, courthouse, library or public memorial.

Good Commercial Grade—For high class buildings designed both for utility and to express something of the character, dignity and stability of the occupancy, such as banks or insurance buildings, high class office buildings, churches, schools, etc.

Ordinary Commercial Grade—For buildings where architectural appearance is subordinate to utility and governed by economic considerations. Workmanship will meet requirements of structural safety, but not carried beyond the point of a good appearance to the casual observer.

Booklet of Color Plates

The Association has published a 24-page booklet, titled "Architectural Granite," which contains twenty-one color plates of some of the principal building granites produced by Association members.

These color plates serve a two-fold purpose—they give at a glance some idea of the great range in colors and textures available in standard American granites, and they also serve as preliminary samples for making preliminary selections for specific jobs, thereby avoiding the necessity of securing actual samples until final selection is to be made.

When color in granite is under consideration it should be borne in mind that, as a rule, polishing produces a darker tone and brings out the color of each component mineral crystal, while a hammered finish gives a much lighter tone to the granite and softens the colors of the contrasting minerals.

This booklet, "Architectural Granite," is a reprint of our catalogue in the twenty-first edition of SWEET'S ARCHITECTURAL CATALOGUE and will be sent on request to any one desiring a copy for their files.

A Service Fulfilling the Recommendations of the American Institute of Architects

Institute Advocates Knowledge of a Material to Develop Better Design in That Material

For a number of years the various chapters of the American Institute of Architects have advocated closer relations between the architect, designer and craftsman, and a more intimate knowledge of materials and methods of working them, so that better architecture may be produced.

In New York and other cities, parties of architects and their assistants have visited the shops of various trades and obtained first hand knowledge of how various materials are worked, their possibilities and limitations. This is valuable both to manufacturer and architect, and especially helpful to the draftsman.

The Research and Information Bureau of the Association Supplies Information on Granite

Several years ago the National Building Granite Quarries Association, representing a majority of the best known granite quarries, decided that all possible information regarding granite and its economic use should be collected and made available to architects and users. This would involve considerable expense, and to be of maximum benefit should be unbiased, continuous and representative of the best experience and practice available. Such work can be done more efficiently by the Association than by individual members, and the Research and Information Bureau was therefore set up in the Association.

As a result of this co-operative undertaking, a fund of reliable and useful information, which a few years ago was not generally known outside the trade itself, has been made available to architects, designers and specification writers.

Granite Well Known from Earliest Times As a Lasting Material

Years ago, before cost was such an important factor, granite was almost always used in the finest buildings because of its well-known lasting qualities. It could be cut to as fine detail as marble, and would hold the sharpness of cutting and withstand the ravages of time and exposure to the elements indefinitely.

Many of the oldest important buildings in this country are of granite and stand today as monuments to the architects and builders of earlier days, despite their long exposure to our great variation in climate. In countries like Egypt, where the climate is most favorable to exposed materials, granite monuments have endured for thousands of years.

The Sympathy of the Designer for His Material

The greatest asset of the true designer is complete sympathy for the material in which he designs. Granite is a hard, crystalline material, not as easily worked as limestone, marble or sandstone, and not adapted to the same cutting process used on the softer stones. Consequently, while granite can be worked to as fine detail as these softer stones, the cost in labor for such work would naturally be greater.

With this in mind, the Association is seeking to show how equally good effects can be produced in granite as given by the finer details in the softer stones, without excessive or, in some cases, prohibitive cost. Granite should not be detailed in the same manner as softer stone unless cost is of no consideration to the designer, but with due regard to details best suited to its aesthetic qualities and the most economical methods of cutting.

How Economies Can Be Effected in Detailing for Granite

The Natural Possibilities of Granite

Granite lends itself most economically to treatment in broad surfaces, in which the color and grain of the granite itself and the many surface finishes, from rock faced to polished, provide aesthetic values exceeding most other stones.

Treatment and Relative Cost of Flat Surfaces

In order to appreciate why and how various surface treatments vary in cost, it is essential to know how the finishes are produced. For a complete description of the regular granite finishes see page A281. Rock face is the cheapest, requiring practically no work on the face itself. Polished finish, which brings out all the color and beauty of the granite, is the most expensive, but possesses qualities not obtainable in any other stone or material.

Relative Cost of Flat and Moulded Surfaces

There is a fairly definite relation between the cost of flat surfaces and mouldings, a knowledge of which will be found very valuable when preparing moulded granite details. This relation is fully explained and illustrated in Plates "A" and "B" on the two following pages.

The use of the "Member System" for estimating mouldings was known and understood only by the trade itself until the Association undertook to explain it to architects and designers for the purpose of eliminating unnecessary cost in moulded granite details.

Studies in Granite

A series of plates, entitled "Studies in Granite," is being published by the Association for the information and use of architectural designers and draftsmen. This series is divided into three groups. Plates I to XXV inclusive deal with granite projects designed by contemporary architects. Plates XXVI to XXXIV inclusive are based upon old world masterpieces in stone and illustrate modification of original details to economic granite practice. Plate XXVIII, on page A279, is typical of this phase of the series.

Plate XXXV, illustrated on page A289, starts a third phase now being prepared for publication. These are original designs illustrating the exceptional adaptability of granite to the modern trend of building construction.

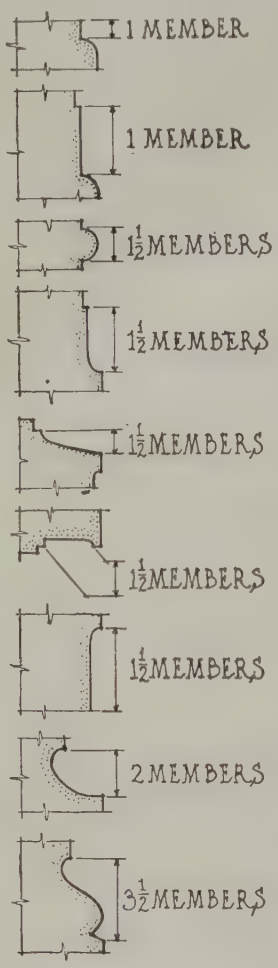
These plates have been rendered by a man well known to the profession, and will make a valuable addition, we believe, to the architect's library. A set of plates I to XXV inclusive will be sent on request to any architect, designer or draftsman, and, if desired, his name will be added to our mailing list for the later plates when ready for distribution.

Continued on next page

DETAILING FOR GRANITE

The use of granite is often restricted because of its cost as compared with freer working stones. The cost of granite need not be so frequently prohibitive if certain facts are considered by the specification writer and the designer.

The cutting of mouldings on granite work involves a greater amount of expensive hand labor than on other classes of work. Mouldings lend themselves to reasonable modification and the cost savings possible are well worth careful consideration when detailing for granite. Some knowledge of the method generally used in estimating cost of cutting granite mouldings will give the designer a good idea as to the relative cost importance of moulded details.



The "Member System" for Estimating Granite Mouldings

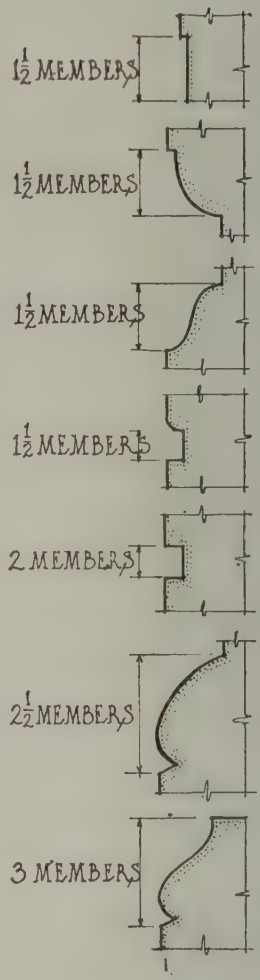
The so-called "Member System" is generally used in estimating cost of cutting granite mouldings.

The profile of a moulded section is first divided into units called "members," a "member" being a more or less arbitrary unit in which the edges, contour, changes in direction and width between edges are taken into consideration.

In counting the number of "members" in any given profile, no hard and fast rules can be laid down, but 4 in. of any contour is the maximum to be counted as a single member. Several basic member counts are illustrated here, and from these practically any ordinary moulded profile may be built up and counted.

To estimate the approximate cost per lineal foot of a moulded profile, multiply number of "members" by the unit of "member" cost per lineal foot and add the cost of plain face displaced by the membered surface at its unit cost per square foot.

The unit cost per lineal foot of "member" varies with grade of granite and finish, as do the unit costs per square foot of plain surface. For approximations, one lineal foot of "member" may be considered equal to a square foot of plain surface for any given granite or finish.

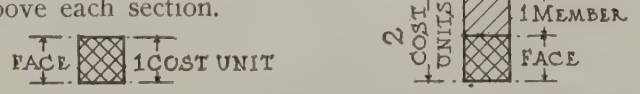


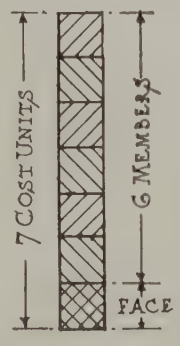
Relative Cost of Plain and Moulded Faces

The cost per lineal foot of a moulded surface, as explained above, is approximately:

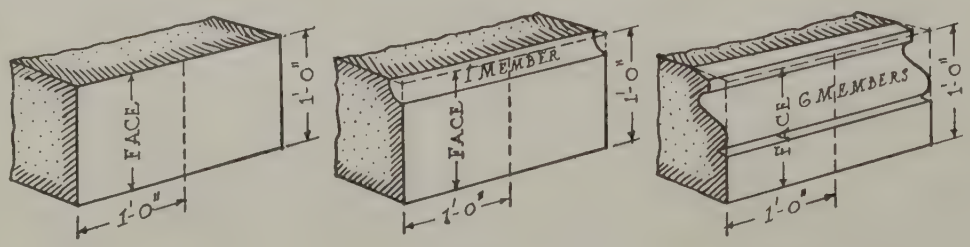
Area of Face @ Face Unit + Number of Members @ Member Unit

The example below visualizes the application of this rule in making relative cost comparisons. Three granite sections are shown of equal face area. "A" has no members; "B" has one member; "C" has six members. The relative cost per lineal foot is illustrated by the squares above each section.





COST PER LINEAL FOOT



(A.) (B.) (C.)

PLAIN AND MOULDED SECTIONS OF EQUAL FACE AREA

Assume cutting cost unit for plain face and for members is $1.50. Applying this unit to these examples, the surface cost per lineal foot of "A" = $1.50; "B" = $3.00; "C" = $10.50. From this example the relative cost effect of superfluous "members" is quite apparent.

The designer, when detailing for granite, can quickly apply this principle to any moulded section under consideration.

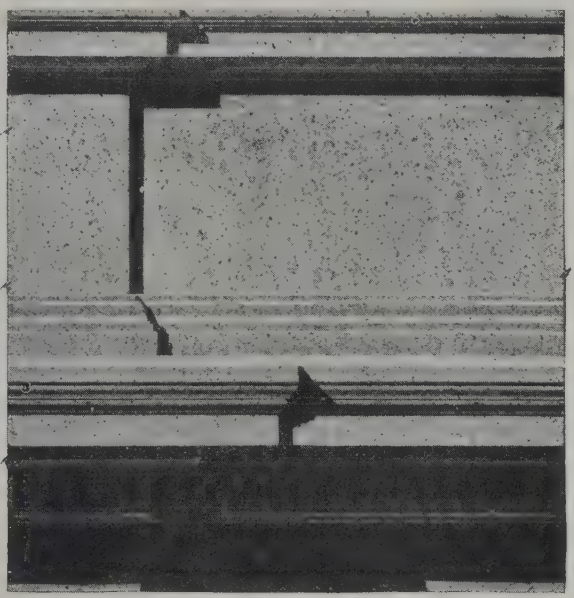
PLATE A

Continued on next page

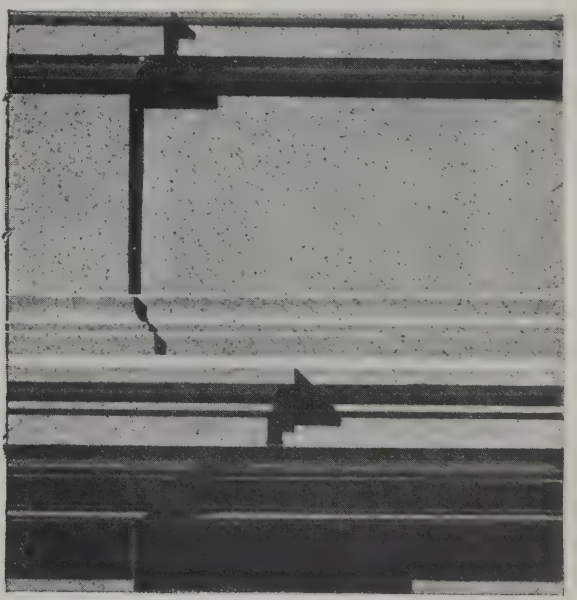
DETAILING FOR GRANITE

Simplification of Moulding—Applied to Specific Detail

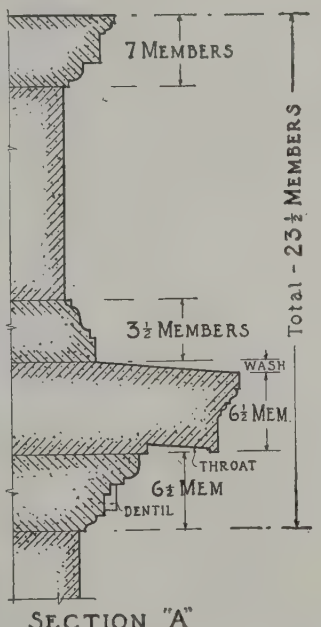
The details below are taken from Plate XXVIII —Studies in Granite, illustrated on second page following. Profile "A" is as originally detailed, while "B" shows suggested modification for economy. The approximate saving is worked out below, showing that intelligent study of granite detail may produce material economies without seriously affecting aesthetic values.



ORIGINAL PROFILE "A"



PROFILE AS MODIFIED "B"



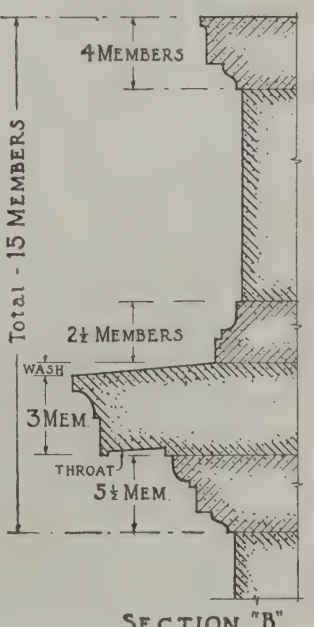
SECTION "A"

Comparison Between Sections Showing Difference in Cost

Profile "A" equals 23½ members + dentils
Profile "B" equals 15 members
Saving: "A" — "B" equals 9 members + dentils

Assume that one member costs $1.50 per lineal foot, and dentils at $3.00 each. The approximate saving then is $12.75 for members and $9.00 for dentils, or a total saving of $21.75 per lineal foot.

Apply this to the perimeter of the building and the total speaks for itself.



SECTION "B"

Other Studies and the Co-operation of Members of the Association

The Association has prepared comparative studies in modification of detail for economy, which are published as part of our series of "Studies in Granite" in the form of Plates, similar to Plate XXVIII, as follows:

Plate XXVI—Main Entrance to Farnese Palace, Rome.

Plate XXVIII—Entrance to Palazzo Sciara di Carbognano, Rome.

Plate XXX—Entrance to Palazzo Negroni, Rome.

Plate XXXII—Entrance to Casino of Papa Giulio's Vineyard, Rome.

Plate XXXIII—Entrance to Habitation Building, Casino of Papa Giulio.

Plate XXXIV—Window, Casino of Villa di Papa Giulio.

The representatives of the Association, or the local representatives of its various member companies, are always glad to give practical advice, from the granite man's viewpoint, as to best and least expensive types of granite construction and detail. For the architect to avail himself of this service may save him considerable time and expense in revising shop drawings after bids are taken and costs found to be excessive.

PLATE B

Information Regarding the Association of Interest to the Architect and Specification Writer

The Association and Its Purpose

The chief aim of this Association is to further the use and sale of granite for building purposes by extending the knowledge of its many qualities and merits, and by establishing means of closer co-operation between the producers of granite and the architects and general building public.

Real Service to Architects

The Association, through its Research and Information Bureau and its field men, offers a convenient and unbiased service to architects and others interested in the use of granite for permanent construction.

This service is freely offered wherever it may assist in the logical and proper use of granite or help to solve the economic and aesthetic problems which may arise when the use of granite is under consideration.

The Research and Information Bureau

This department has been developed to collect and disseminate useful and reliable information concerning granite. This information is being gathered constantly from within and without the industry and the Association has become the clearing house for the best information available.

Study and research is being carried on concerning the different granites available for architectural uses, the chemical and physical properties of granite, problems in economic detailing and production, experience and good practice in actual use.

Architects, and others interested in the use of granite, are invited to make use of the services of this department freely and all requests for information pertaining to granite will receive willing and careful attention.

The Field Service of the Association

Qualified representatives of the Association are in the field calling upon architects for the purpose of making available the facts and information accumulated by the Research and Information Bureau. Timely and unbiased information may be had through the field service. Economic points as to design, detail and specification of granite work may be discussed and quickly settled.

The field men will be glad, when requested, to obtain information which may not be immediately available, and to assist the architect and specification writer in every way possible in connection with the use of granite.

The Association can render most valuable service when a project is in its preliminary or initial stages. The architect need not hesitate to discuss a project with our representative at any time, and if for any reason he wishes to avoid premature publicity he need only so indicate and the matter will be treated as strictly confidential until such time as information concerning the project may be properly reported to our member companies.

Service of Representatives of Member Companies

The member companies of the Association maintain sales offices and representatives in many of the larger cities. These men are experts on granite and well qualified to render definite and valuable services to architects and specification writers in their districts.

Accurate and reliable information may be secured by consulting these representatives when any specific project is under consideration, and they are always willing to furnish samples of their granites or to submit preliminary or final estimates upon specific work.

Permanent Exhibits of Granite and Finishes

The Association maintains permanent exhibits of the various standard building granites, produced by its member companies, at the following convenient addresses:

Architects Samples Corp., 101 Park Avenue, New York
Master Stone Cutters Assn., 220 So. 16th Street, Philadelphia
National Building Granite Quarries Assn., 31 State Street, Boston

Here will be found the various colors and textures from which architects may make selections of granite for any specific project.

Here also are displayed complete sets of samples illustrating the regular building granite finishes, which the Association has adopted as standard. The selection and specification of finish for any specific job by reference to these standards, will assure definite and mutual understanding as to just what is wanted.

A model "Study in Granite" is included in the New York exhibit, illustrating the possibilities of combining various colors and textures, using standard granites.

Architects and the general building public are invited to inspect these exhibits when considering the selection of materials or finish.

Securing Estimates and Samples

The Association does not quote prices, but requests for preliminary or final estimates on granite work will be transmitted to interested members and estimates promptly obtained.

Plans and specifications for specific work may be sent in to the Association office and made available to its members for estimating purposes. Architects and contractors are invited to avail themselves of this service, which has proved its value and frequently produces bids which might not otherwise have been secured.

Requests for samples will be transmitted to members producing the kind and quality of granite desired, and information will be furnished as to where specific colors and qualities of granite may be obtained, whether produced by Association members or non-members.

The Association Code of Ethics

The Association stands for fair practice in bidding and advocates that bids, tendered in good faith in accordance with plans and specifications, should be fairly considered and used, both as a matter of principle and in order that the best interests of all parties concerned may be assured.

Uniform Proposal and Contract Forms

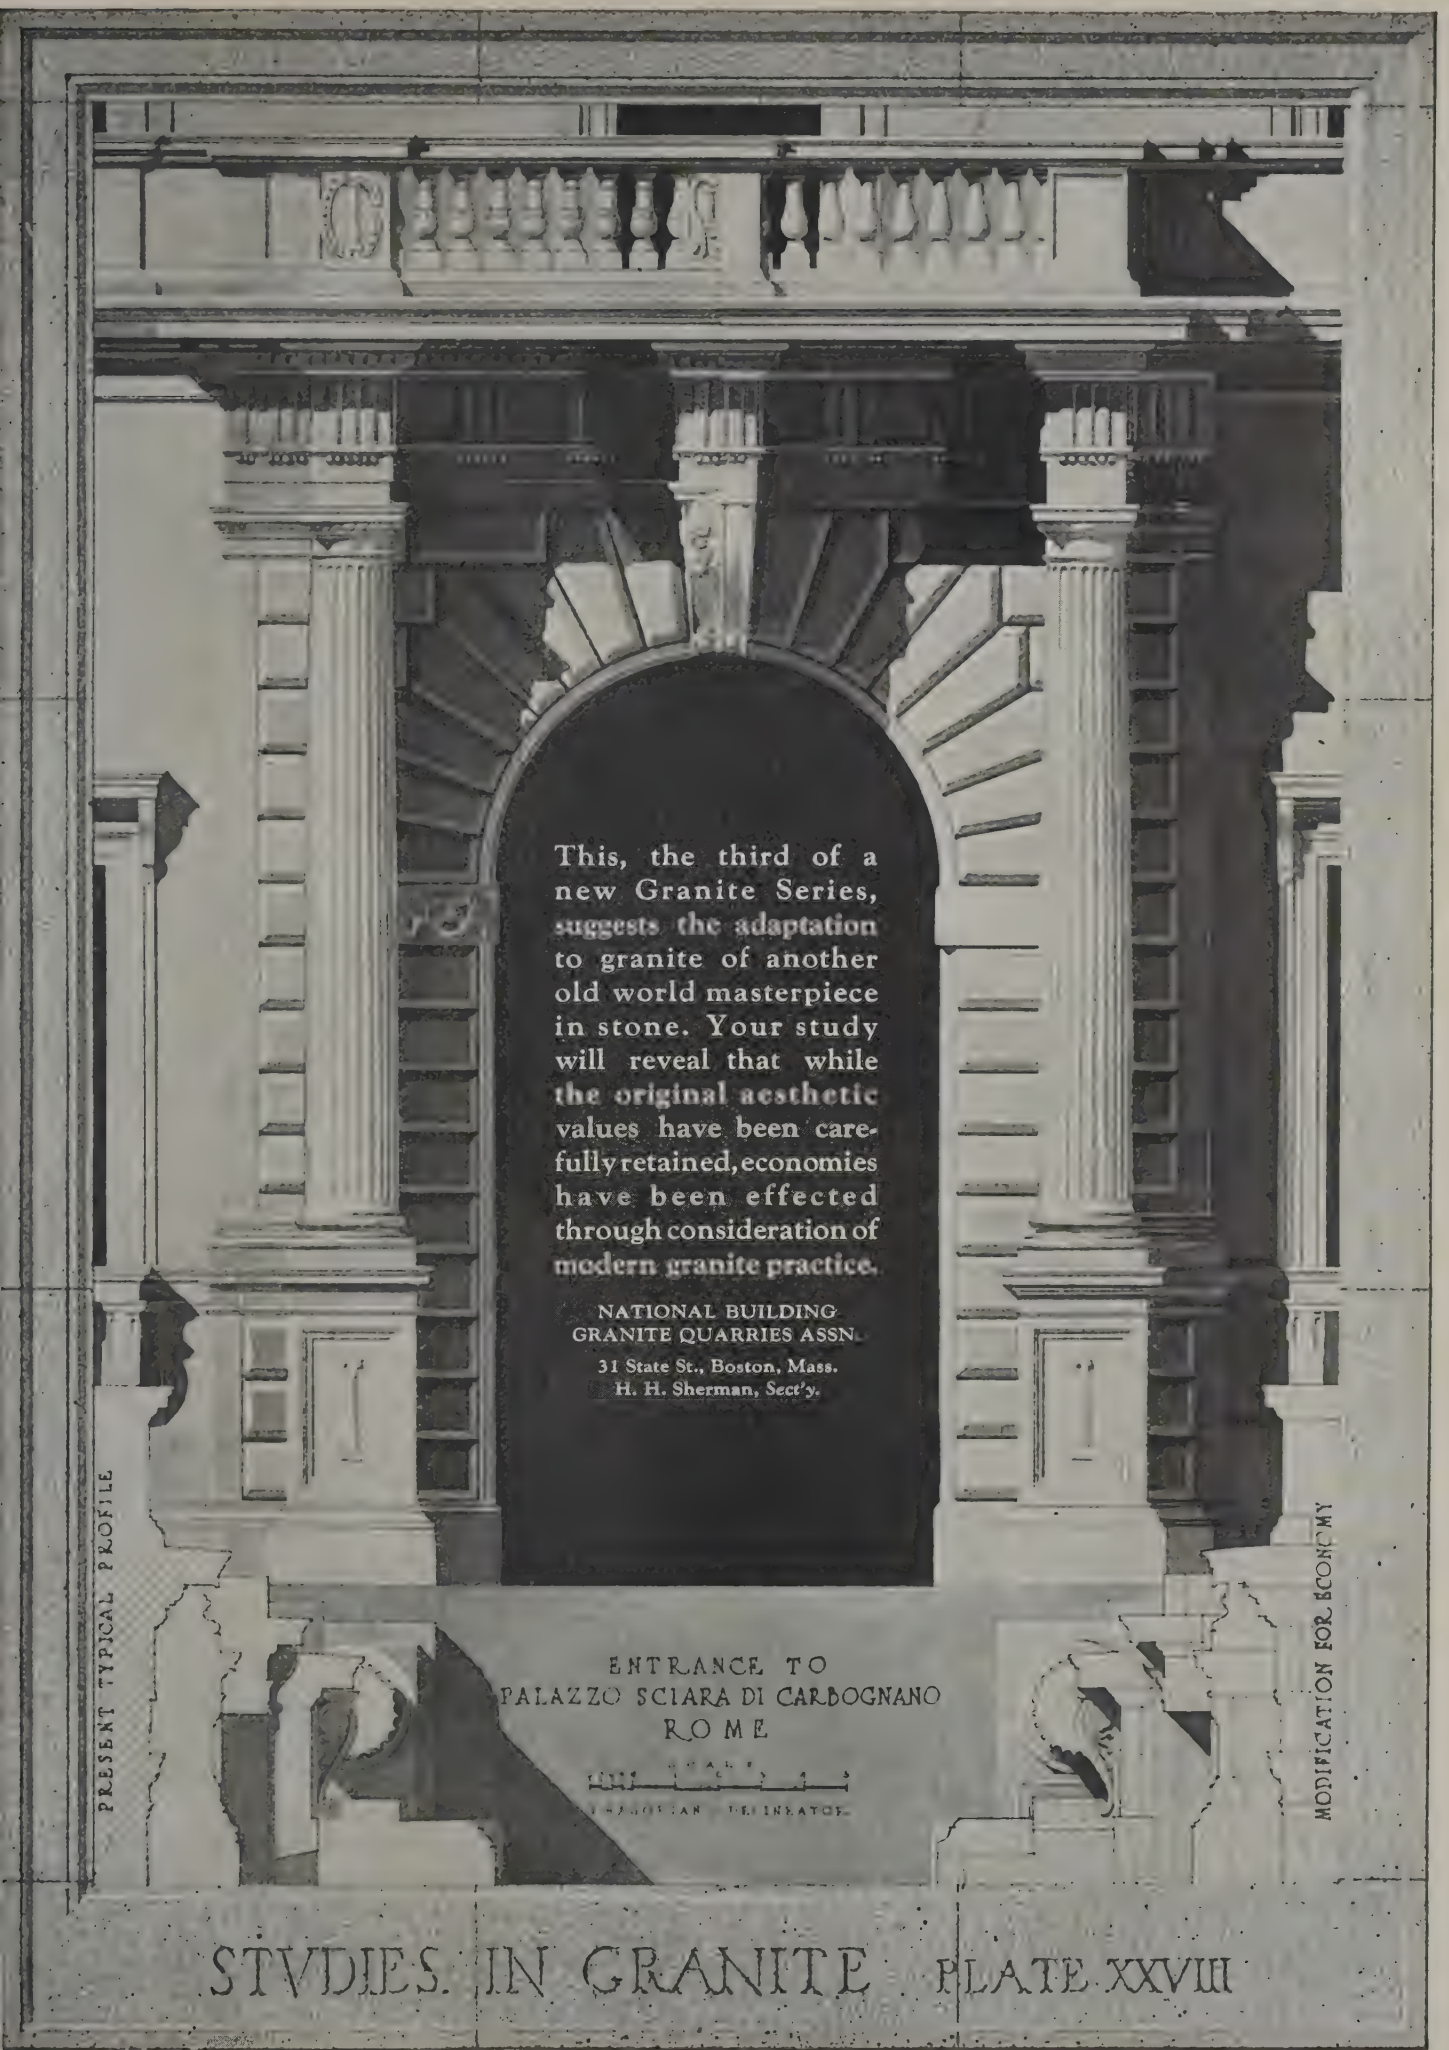
Uniform Proposal and Contract Forms for granite work have been prepared and adopted by the Association. The terms and conditions are fairly standardized and the equity of both parties has been carefully studied and protected.

These printed Association forms have been in use for several years and have met successfully the test of application. Two forms of contract are provided, one for the granite work "Set in Place" and one for the work "f.o.b." These Contract Forms are recommended by the Association for general use on granite work, and copies will be sent for inspection upon request.

Responsible Competitive Estimates

The Association, through its reports to members concerning prospective work and bids desired, stimulates competitive bidding, backed up by responsible concerns operating the best organized and equipped plants in the granite industry.

Continued on next page



Continued on next page

Architects and contractors, who advise the Association concerning bids desired, undoubtedly will secure a larger number of responsible, competitive bids, with a minimum of effort and expense. Requests for bids, with information as to closing dates, are transmitted to the member companies upon receipt, and bids are sent direct to architect or contractor by those bidding.

The Association has no control over or responsibility for prices made or quoted by its members, and has no knowledge as to who are bidding or the amounts bid until after the bids are delivered and opened by the recipient on the date set for closing.

Financial and Production Responsibility of Individual Members of the Association

To meet successfully the demands of modern building construction, the granite producer must fulfill very definite requirements as to financial responsibility, type of organization, and adequacy of quarries and finishing plants.

Association members have been and are the leaders in developing their financial organization and production facilities to meet these exacting requirements. They can furnish unquestionable references as to past performance and responsibility, and are entitled to preferential consideration wherever building granite is under consideration.

In granite, as in other materials, bids are submitted and contracts undertaken by concerns which lack the experience and ability to execute them satisfactorily, and whose quarries and plants are inadequate to meet the requirements. These facts should be carefully considered when awarding the granite contract. Bids tendered by Association members should receive especial consideration on the ground that contracts based upon them will be satisfactorily executed.

Adequate and Dependable Quarries

In selecting granite for building purposes, the ability of the quarry to produce the quantity, sizes and quality of granite desired is the first essential. The quarry must be so equipped that its output may be handled and shipped at a rate to meet the cutting requirements, not only for the work under consideration, but all the work which may be simultaneously under contract.

The Association quarries, without exception, meet the above requirements. They are all quarries of established reputation and have been developed to meet the requirements of quantity production.

Modern Cutting and Finishing Plants

Granite is delivered to the finishing plant from the quarry in rough blocks—some already split to approximate dimension sizes, and others to be drilled and split to dimension, or sawed into slabs.

Modern building granite plants must be well equipped with up-to-date machinery and appliances for handling and manufacturing granite in considerable quantity, efficiently and with first class workmanship.

Included in the essential equipment of a modern granite finishing plant are saws, carborundum machines, polishing machines, pneumatic surfacing machines, turning lathes, sand blast, pneumatic hand and carving tools, and pneumatic drills. The handling equipment must be adequate and speedy, and arranged to serve the producing machinery and hand workers, and to handle the storing and loading, efficiently and safely.

The handling, machinery, sawing and polishing of granite requires power in large quantities. Adequate and dependable power is therefore a most important essential, and adequate blacksmith shops, carpenter shops and repair shops are also necessary accessories to a properly equipped plant.

Handwork is required in finishing the average type of architectural granite work, and a good journeyman granite cutter is one of the most skillful craftsmen in industry today. Modern tools and machinery have relieved this craftsman of a great deal of laborious and time consuming work, but his skill of hand and eye is as indispensable today as when the Egyptians cut their granite temples.

Association plants include the largest and best equipped plants of their kind in the country. They have been established for considerable periods and a "home guard" of skilled workmen has been built up to supply their steady demand for first class men. These are important factors in the superior ability of Association plants to fulfill both the quality and quantity demands for architectural granite work and entitle them to preferential consideration.

Each Member Has An Experienced Organization

Without a properly managed and experienced organization, even an adequate quarry and well equipped finishing plant will not ensure satisfactory execution of contracts.

Association members have built up organizations having the necessary experience and ability to put through whatever they may undertake. Their estimators have the benefit of actual cost figures covering a wide variety of executed work, thereby removing much of the guesswork and chance taking, because of which many a job is skimped and botched. Their draftsmen are the best trained men to be had and their knowledge of practical stereotomy, skill in layout and accuracy in figures may be counted upon to discover, in advance, errors in vital dimensions or impractical points in construction or jointing, thereby avoiding delay and expense to all concerned.

Experienced and practical salesmen constitute a service as well as a sales force, and the co-operation they are able to offer is frequently of no small importance in the securing of reliable preliminary estimates and in consultation as to practical economies possible.

Importance of Proper Planning and Supervision in the Mill

The planning and routing of work through the mill and its consistent and thorough inspection while in process and at completion, due to well trained and experienced plant management, is all reflected in expedited erection at the building and a minimum of interference with the progress of the work of other trades.

Inadequate or inexperienced plant management and supervision usually goes hand in hand with inordinately low bids, and poor workmanship, delayed and muddled deliveries, expensive tie-ups and delays to other trades on the building itself, usually follow as a natural consequence, and more than eat up any supposed savings.

The Association's Relation to Member Companies

The Association is maintained by its member companies as a vital and necessary extension of their individual organizations, to carry on collectively those important services which make for efficiency and economy and are alike beneficial to the users and producers of granite generally.

Information as to Various Granite Finishes

Description of Regular Surface Finishes, Arranged in Order of Relative Cost

The surface finishes most frequently used for granite on building work are:

Rock faced, pointed, pean-hammered, four-cut, six-cut, eight-cut, rubbed, honed and polished. These terms are frequently misunderstood and sometimes misapplied.

The following brief description of finishes most generally used is therefore given:

Rock Face—Generally the least expensive finish, but with decorative as well as utilitarian value.

The relative cost varies with the grade of work required.

The grades vary from ordinary split or quarry face ashlar with split or roughly squared beds and joints, to carefully quarried faces having practically uniform projection, and with joints and arrises as carefully and accurately cut as for hammered work, and sometimes with rusticated or tooled margins.

Pointed Work—Coarse, medium, fine and machine pointed are the four general distinctions for pointed work, with many special types for certain texture effects.

Hand pointing and machine pointing differ slightly in general appearance, machine pointing being generally more uniform. Special pointing is generally more expensive than the standard grades. In general, the point depressions in fine pointing will be approximately $\frac{3}{8}$ in. apart, medium and machine pointing $\frac{5}{8}$ to $\frac{3}{4}$ in., and coarse pointing 1 to $1\frac{1}{4}$ in.

Where special pointing is required, a sample should first be prepared under the architect's supervision. Beds, joints, and arrises will conform to the character of use and grade of pointing.

Pean-hammered—Adapted to rougher work, such as steps, curbings, house or mill sills and thresholds, or to portions of high class work not exposed to the eye. Pean-hammering is coarser and less regular than four-cut and the point marks are not entirely eradicated by the axing.

Four-cut, Six-cut, and Eight-cut—These finishes are produced by bushing with the patent "bush-hammer." This is a hand-hammer with patent head having two opposite jawlike openings about $\frac{7}{8}$ in. wide, into which are firmly bolted sets of four, six or eight cutting blades as the case may be.

Four-cut work is frequently and erroneously specified as four cuts to the inch. Actually the four-cut hammer leaves nearer five cut marks to the inch, as four cutting blades are clamped into a $\frac{7}{8}$-in. jaw; six-cut and eight-cut are likewise incorrectly specified as six cuts to the inch or eight cuts to the inch.

In bush-hammered finish the resultant surface has the appearance of being uniformly corrugated to the fineness determined by the number of cuts used, but while the bushing is kept parallel and in the required direction the bush marks are not necessarily continuous or mechanically precise.

Six-cut and eight-cut finishes are simply continuations of the four-cut process, each finer hammer being used consecutively until the required finish is reached.

Pneumatic surfacing machines are also used for bushing, especially on all larger surfaces, following practically the same routine as required for hand bushing. Sawed surfaces are also bushed under the surfacing machines, in which case much of the preliminary preparation is avoided.

Ten-cut and Twelve-cut—These finishes are also produced, but less frequently used on regular building work, being more applicable to small memorials or special work. Texture and character are emphasized by the coarser finishes.

Rubbed and Honed—Produced by grinding a pointed or sawed surface under the polishing wheel. The grade of rubbing is determined by the extent to which this grinding is carried and the abrasive used; from coarse-rubbed, with small surface scratches, adapted to work requiring fine smooth finish but not close to the eye, to honed finish, which is the last stage just before glossing, with velvet smooth surface, practically free from scratches.

Polished Finish—Produced by glossing, under a heavy, felt coated wheel, a surface previously rubbed and honed. A durable and mirrorlike polish requires that the grinding and glossing processes be carried to their extreme stages, leaving a surface free from scratches, dull spots, or "stun marks" from the tooling.

Under modern methods practically every standard granite may be polished to a satisfactory gloss, suitable and durable for most ordinary requirements. Generally the harder granites and those containing the least mica content take the best and most durable polish.

Hand Polishing—Small surfaces and mouldings generally have to be rubbed, honed or polished by hand at considerable extra expense over machine work or cut work of similar character. On work where cost is the dominant factor portions necessitating hand rubbing or polishing should be avoided wherever possible.

Selecting the Finish

The following general suggestions will indicate methods of selection, which depend on the type and design of building, and color and texture of the granite.

Large scale work: rock face, pointed and the coarser cuts. Small scale work: the finer cuts.

Rock face, pointed, pean-hammered, and four-cut for economy, and rock face and pointed for decorative effect in conjunction with hammered work and other materials.

Six-cut for average work, combining economy with good architectural effect.

Polished for base courses, portions subject to traffic stain, lower stories where exposed to smoky atmosphere, and for decorative effect.

Rubbed or honed where fine finish is required and for softened tone and texture effects.

Polished finish is practically impervious to stain or weather. Fine finishes will keep clean longer than coarser finishes, particularly where subject to atmospheric dirt and dust.

The possibilities of combining different grades of finish are almost unlimited, and combinations of different granites are used extensively with splendid architectural results.

Standard Grades of Surface Finishes

The half-tone reproductions on the next two pages illustrate the standard grades of surface finishes most commonly used on exterior building granite work. The reproductions are full size and have been prepared from a standard light gray granite but are much darker than the actual granite to bring out more clearly the different finishes.

The relative cost of the different finishes runs approximately in the same order as the reproductions are numbered, with rock face as the less expensive and polished as the most expensive.

Practical Notes on Granite Specification and Design

The use of granite is often restricted because of excessive cost over other stones. The cost need not ordinarily be prohibitive if certain fundamental facts are taken into consideration by the specification writer and designer.

In Regard to Specifying Finishes and Color

The cost of granite work will be materially reduced if reasonable variations in tone and texture, characteristic of most quarries, are permitted, eliminating only the too sharply defined and obvious deviations, such as unsightly knots and clearly defined stripes.

The finer cuts are often specified where coarser finish would be fully as appropriate and considerably less expensive. Rock face and the pointed finishes may frequently be used with good effect and at reduced cost. Sawed finish, or sawed and lightly steeled or sanded, is effective and economical for plain surfaces.

Treads of steps and platforms, as a safety measure as well as economy, should not be finer than four-cut. Machine pointed is even more practical and less expensive. For inexpensive steps sawed treads and split risers are effective and practical.

Beds and Joints Deserve Attention

A surprising percentage of the total cost of granite work is in the cutting of beds and joints. Elimination of unnecessary requirements here will produce material savings. Bush-hammered edges and unnecessary fullness of beds and joints add unnecessary expense.

We recommend ¼ in. as the minimum allowance for beds and joints on monumental building work. On work of coarser finish and texture, ⅜-in. and even ½-in. joints are adequate and effective. For more massive masonry even larger joint allowances are both good practice and more economical.

Granite Carving and Models

Granite can be carved with the same delicacy of treatment and detail as much softer and less durable stones. The pneumatic carving tool, in the hands of a skilled granite carver, has made it possible and practical to carve granite to almost any extent desired.

In the preparation of details and models for granite carving, three points should be considered: the color and texture of the granite; location in the building as to distance from the eye; and location as to sunlight.

Color and *texture* regulate to a material extent the decorative value of the detail produced. Delicate detail would generally be wasted on a coarse grained granite having strongly contrasting mineral constituents. In a fine grained, light colored granite, or a granite of light, uniform tone regardless of grain, delicate details would appear more nearly in their true values.

Distance from the eye should obviously regulate the character of detail and treatment, both from the aesthetic and economic viewpoints.

Location as to sunlight is generally the least considered point of all. The relative light and shade values of different exposures should regulate to some extent the character of detail and mass.

Granite Versus Less Durable Material

Before ruling out a superior material like granite because of supposedly prohibitive cost, greater latitude should be permitted in stock, finish, jointing and detailing than in any less durable material which might otherwise be substituted. Unsightly discoloration and disintegration of the less durable material will soon efface what little extra detail may be retained by the substitution, and its ultimate good appearance and architectural value be entirely destroyed. The crudest of granite work maintains its superior qualities indefinitely, and good granite work remains a joy forever.

A Few Cost Saving Pointers

The cost of granite work may be materially reduced by a study of the countless minor details from the viewpoint of economical production. A few pointers are given below as typical examples, and a study of the various granite plates illustrated in this catalogue will suggest others.

Projections—Avoid projections on courses which might otherwise be sawed or machine surfaced.

Jointing to Save Stock and Hand Cutting—Cornices and similar courses can often be jointed to permit sawing or machining of the flat surfaces and to save stock. Internal angles, cut in the solid, should be avoided by jointing-up.

Avoid Raised Seats and Lugs—Raised seats and lugs on balustrade base, platforms, sills and thresholds are expensive. Keep to flat surfaces where possible, using depressed lugs if necessary.

Rustications, Rabbets, Checks and Drips—Detail to be carbo-sawed rather than for hand cutting.

Steps and Platforms—Avoid unnecessary bedding to exact height by allowing at least 2 in. between top of concrete and bottom of stone. Four-cut or machine point treads.

Area Coping—Four-cut or machine pointed top and split face is economical and usually adequate. Omit rabbets for grilles, substituting iron brackets. Eliminate lock joints and substitute dowels.

Balusters—Substitute round for square plinths on turned balusters. Bed to slope of base to avoid raised seats.

Simplification of Moulding—By eliminating unnecessary members and unimportant minor details will reduce cost materially. A study of the section on Detailing on page A275 and Plates "A" and "B" on pages A276 and A277 will be helpful in this connection.

Eliminate Guesswork in Estimating—Make plans, details and specifications as complete and clear as possible and ensure closer and more intelligent estimates.

Detail for Granite—Detailing for stone, regardless of whether it is to be of granite, marble or limestone, is responsible for much of the extra cost of granite. Best results will be secured if details are made specifically for granite. The Association can render real service here if consulted while details and specifications are under way.

The New Sand Blast Method of Carving and Surface Treatment

The attention of architects and designers is directed to a recently developed method of producing ornament and treating surfaces on granite by use of the sand blast. This process has been used considerably in the memorial granite industry, but has not, as yet, been extensively applied to architectural building work.

We believe, once its possibilities are recognized and understood, that progressive architects and designers will quickly appreciate its aesthetic and economic value, and that through their creative ability a distinct new type of ornamentation may be developed and especially adapted to modern American structures.

The description of the process and sketches illustrating a few very simple forms of application to granite work on the following page are offered merely as an aid to visualizing the basic principles of the process as already developed in the memorial field. The experienced designer will quickly grasp its scope and limitations from this presentation.

Continued on next page

THE SAND BLAST PROCESS AND ITS APPLICATION TO GRANITE CARVING AND SURFACE TREATMENT

The Sand Blast Process Described

This process has well been termed a "harnessing of the sand storm," for the sand blast is controlled at will to the etching of unique and beautiful ornaments. The cutting medium is white silica sand, or similar abrasive, driven through a controlled nozzle at very high velocity by compressed air, under absolute control of the operator.

The face of the stone to be "blown" is covered by a rubberlike composition about ⅛ in. thick, termed "dope" or "glue" in the trade. This "dope" is then cut away from the parts to be etched, forming, in effect, a stencil of the outline or ornament.

The sand blast etches away the granite thus exposed to the depth required in a remarkably short time. After the stenciled design is "blown," the blanket of "dope" is removed from the stone, revealing a remarkably clean cut intaglio possessing a unique texture and beauty impossible to duplicate by any other means.

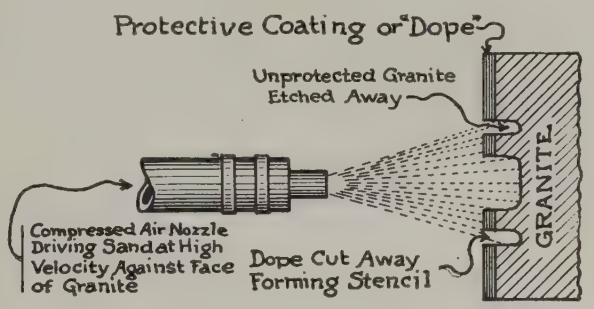

Diagram Showing Principle of Sand Blasting Process

Surfaces may also be etched in a similar manner to a moderate depth to produce sinkages and unique texture effects having almost limitless possibilities.

This, in brief, is the process. There are many variations in technique, and combinations of blowing, re-doping and re-blowing, by means of which a skillful operator may produce effects in shading, variable depths and texture which have unrealized possibilities of application and development.

Simple Forms of Application

The sketches below illustrate a few typical forms of application, from which the basic principles of sand blast ornament, as developed in the memorial granite industry, may be visualized. Applications of these simple principles to architectural ornament may be developed to any extent desired.

While the sinkage produced by the etching is relatively slight as compared to regulation carving, the sharpness of its cuts and the unique tone and texture of its surfaces in contrast with hammered or polished surfaces, produce effects which cannot be duplicated by any other method.

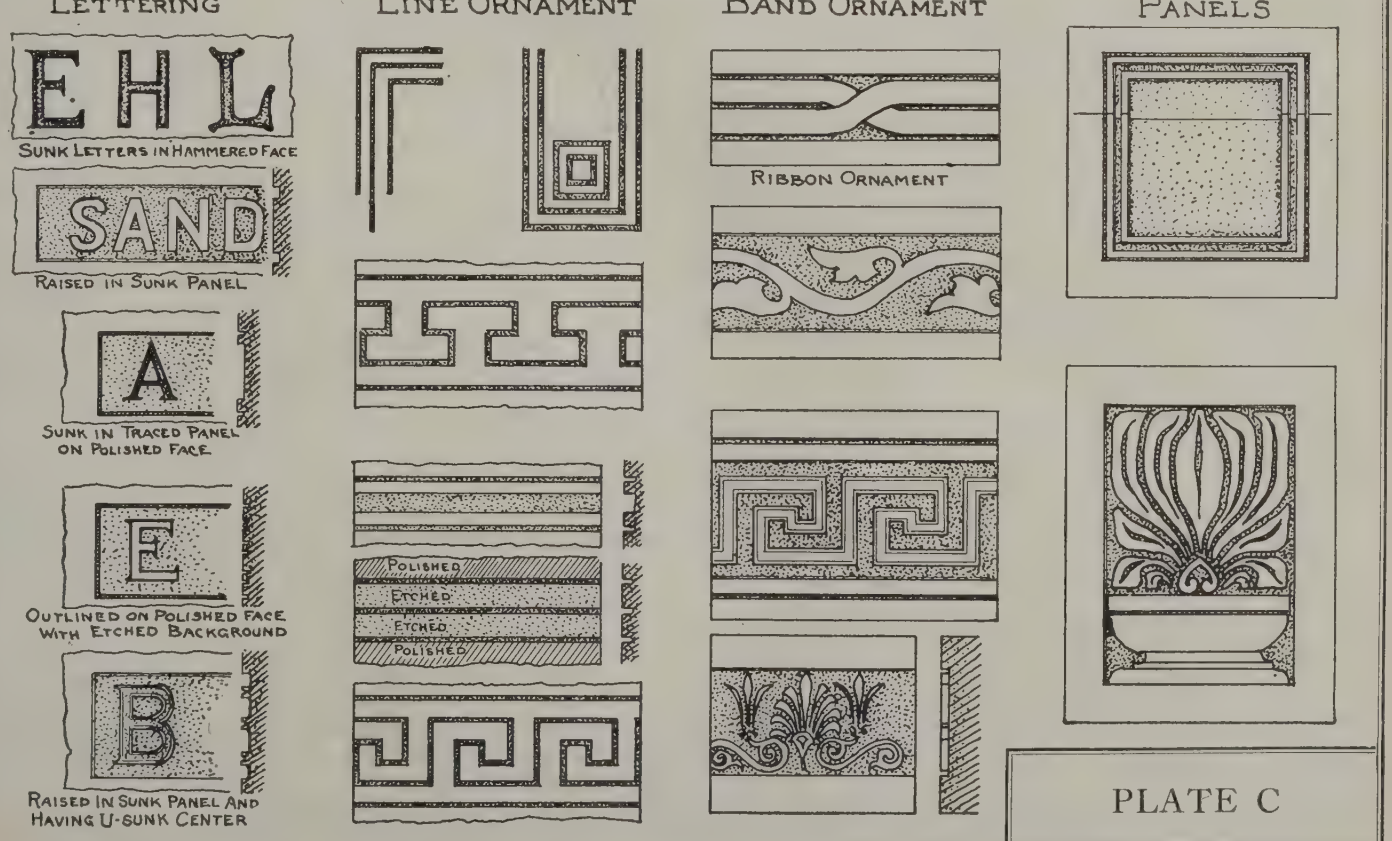

PLATE C

Granite Specifications (Complete Form)

Section 1. General Conditions—All work included under the specifications for granite is to be subject to the general conditions hereinbefore written for the entire work.

Section 2. Material—All granite shall be of compact structure, hard and practically non-absorbent, and equal in durability and strength to the best granite of the kind required. Granite shall be (mention color, tone and grain) and of the kind designated as (mention name) granite from quarries at (mention location).

Granites designated as (mention names and quarries), will also be considered.

In submitting estimates, the contractor shall state the name of granite, and quarry, upon which his proposal is based.

Section 3. Quarry and Plant—Granite must be obtained from approved, well-known quarries having capacity and facilities for furnishing the quantity, sizes, and quality of granite required, and the cutting and finishing must be done by firms properly equipped to produce the finished material without causing delay in the progress of the work.

Evidence to this effect must be submitted if required by the architect.

Section 4. Quality—All the granite shall be selected to meet the requirements of these specifications and shall be absolutely sound and free from seams or other defects which would impair its strength.

Exposed surfaces shall be free from spots, stain, discoloration, knot formations, spalls, chips or other defects, which would impair the appearance of the work, except that in inconspicuous places a reasonable number of knot spots or texture variations inherent to the particular granite proposed may be permissible if the samples showing the maximum of such characteristics be submitted to, and approved by, the architect.

In quarrying the granite the blocks shall be so selected that any variations in color permitted by the architect will be uniformly distributed throughout the exposed surfaces of the walls and other portions of the work.

If granites from different quarries are used such granites shall be similar in texture and shall satisfactorily match in color and tone throughout the work.

Section 5. Work Included—The work to be done by the contractor under the heading of Granite shall include the furnishing, delivery and setting in place and completion of all granite work as required by the drawings and herein specified.

The work generally shall include (state portions of work to be of granite).

Note: State any portions or special features which are not to be of granite or not to be included in this contract.

Section 6. Shop Drawings—The granite contractor shall prepare all necessary shop drawings, showing the bedding, bonding, and jointing of all the granite work and typical and special anchoring of same. The dimensions and setting number of each granite stone shall be indicated upon the drawing which shall be submitted and approved by the architect as required under general conditions. No cutting shall be done or work completed except from shop drawings which have been approved by the architect.

Section 7. Corner Stone*—The granite contractor shall furnish and set where indicated on the drawing (or as directed) a corner stone of the required dimensions, having an inscription cut thereon in accordance with the drawings and recessed to receive the copper box to be furnished by the (general contractor).

Section 8. Samples—After the award of the contract two samples of each kind of granite required 8x8x2 in., showing the extreme variation in quality, color and texture that will occur in any granite which will be used, shall be submitted to the architect.

Upon approval of these samples, one of each shall be returned to the granite contractor for use at the quarry or plant and the other retained by the architect for comparison with work at the building.

Samples shall be dressed on the face and one edge to show finish required by the specification; opposite face may be split or dressed to the approximate size called for or may be dressed to another of the specified finishes called for.

Section 9. Finishes—The exposed surfaces of the granite shall be dressed as indicated on the drawings or specified herein.

In general, surface finishes shall be as follows: From 2 in. below grade to level (state level or course) shall be dressed with best (state finish—as polished, six-cut, eight-cut) work; from level (state level) to level (state level) shall be dressed with best (state finish) work; and from level (state level) to top of parapet shall be dressed with best (state finish) work.

Note: State here any exceptions to the above such as "treads of steps or platforms shall be ..... finish"; "back of parapet and coping courses shall be ..... finish," etc.

The cut marks of all bush-hammer work shall be vertical except as noted.

Soffits shall be bushed at right angles to the face.

Faces of key blocks and voussoirs shall be bushed (state whether vertical or radial).

Top surfaces of window and door sills, steps, copings, washes and projecting courses shall be bushed at right angles to the nosing.

Moulded surfaces shall be bushed parallel to the direction of the mouldings.

Note: Mention other specific instructions on direction of bushing.

Section 10. Cutting—All exposed surfaces must be out-of-wind, free from waves, projections or depressions, and faces of granite in the same plane must be absolutely flush at joints. Arrises must be cut sharp and true to square or pattern and continuous with adjoining arrises.

Slight inequalities which may occur in setting shall be trimmed to the proper surfaces and refinished equal to the original finish.

Section 11. Beds and Joints—Beds shall be horizontal and shall be cut full and square for a distance of at least 2 in. back from the face, from which point they may fall off not to exceed 1 in. in 12 in.; and shall be reasonably free from large depression and cuppings, which might impair the stability of the work.

Joints shall be dressed at right angles to the face for at least 1½ in. back from which point they may fall away, not to exceed 1½ in. in 12 in.

Backs of granite stones shall be scabbled or split to approximate vertical surfaces which shall not vary more than 1 in. in 12 in. from the true vertical, nor vary more than 1 in. either way from the thickness called for on the drawing.

Section 12. Jointing—The jointing of the granite work shall be as shown on the drawings and no additional joints will be permitted except upon written consent of the architect. The joints shall be uniformly ¼ in. in thickness.

Section 13. Bonding—The bonding of various portions of the work shall be as shown on drawings. Alternate courses of granite shall bond at least 4 in. with the backing except where otherwise shown. No granite stone shall have less than 4-in. bed; projecting courses shall have beds equal to the projections unless otherwise shown. Where brick backing is required the granite shall not go closer than 4½ in. to the inside of the brick wall. Where granite facing occurs at grades it shall extend nowhere less than 4 in. below grade unless otherwise shown.

Section 14. Reveals and Returns—Reveals of all openings, unless otherwise shown shall be cut solid without vertical joints.

Returns shall be not less than indicated on the drawings.

Mitering of granite stones at corners will not be permitted.

Section 15. Mouldings—Granite stones forming continuous moulded courses shall be of uniform profile on the face with continuous unbroken lines absolutely flush at the joints and with the surfaces free from projections or depressions and out-of-wind.

Section 16. Washes and Drips—All exterior projecting granite stones and all exterior sills, steps, platforms, coping and other stones with exposed top surfaces, shall be cut with a wash on top. Where other work is built upon such granite stones, they shall be cut with raised seats and lugs to form level beds for work built upon them.

All projecting granite stone, such as sills, cornices, copings, etc., shall have a groove drip cut on the underside unless otherwise detailed.

All exterior door sills shall be cut with raised thresholds unless otherwise shown.

Section 17. Miscellaneous—Mouldings and projections must not be subjected to pressure; and granite stones having projecting members which have weight of any kind bearing upon the upper surface shall have seats cut to bear such weights; and in all cases the edges of mouldings or projections must be kept free from pressure.

*If required.

Specifications (Continued)

Reglets shall be cut for flashing and counterflashings as required.

Section 18. Models—Full size plaster models of all ornamental and carved work, shall be furnished to the granite contractor as hereinbefore specified.

Where necessary for the proper execution of the work, models will be delivered at the plant of the granite contractor free of expense to him, to be used by him for the purpose of roughing and such carving as may be done at the plant, the granite contractor to carefully preserve these models for re-shipment to the building if required. The expense of handling and re-crating for shipment at the plant to be borne by the granite contractor.

Section 19. Roughing for Carving—No roughing for carved work is to be done from drawings but from approved models only. Sufficient stock in all cases shall be left for the carving and the granite shall be roughed to suitable form and condition for the carver. The cutter and carver shall co-operate in the method of securing the proper roughing for ornamental work.

Section 20. Carving*—Carving may be done at the site either before or after the granite is set or the work may be delivered at the site already carved.

In case the carving is done at the plant or at the site before being set in place, this contractor shall do all necessary refinishing or retouching to make the carving conform to the models and to the satisfaction of the architect. All carved ornament shall be executed by hand by skilled carvers in a spirited and artistic manner and in strict accordance with the approved models.

Where carving is done after the work is set all necessary staging and protection shall be furnished by the general contractor, and if required the models shall be hoisted into position and properly secured to the scaffolding for the convenient use of the carvers by the general contractor.

Inscriptions, lettering or numerals if required shall be clean cut and in accordance with the models, if provided, or otherwise with the full sized details of same. The incised surfaces of lettering shall be cut smooth and accurately to the full depth and section shown on the models or drawings.

Section 21. Crating and Shipping—This contractor shall properly crate the finished granite for shipment, the crating being so constructed as to properly protect the edges and surfaces of the exposed portions of the work during shipment and handling prior to setting same. Due precaution shall be taken to use crating material which will not stain or discolor the exposed surfaces of granite; and especial care shall be used to protect and suitably note any delicate portion where extra care should be observed in handling.

The finished granite properly crated shall be carefully loaded for shipment by this contractor who shall exercise all necessary precautions in loading to withstand the usual hazards in transit.

Section 22. Precaution Against Stain—Special precautions shall be taken in the setting to guard against possible seepage through the joints of moisture from the mortar or material used in backing up the granite work, which will cause discoloration around the face joints or surface of the granite.

At least 12 hours before the granite is set, all surfaces not exposed shall be thoroughly coated with an approved dampproof compound to within 1 in. of the exposed face. After the granite is set, and before backing up, another coat of the same dampproofing compound shall be applied to the back for the special purpose of covering the backs of the mortar joints.

The painting of the granite may be omitted with the approval of the architect when it is definitely known that the setting mortar will not stain the granite, but the backs of the mortar joints should be dampproofed in any event to guard against seepage.

If the first coat of dampproofing is applied at the mill, the setting numbers must be painted conspicuously over the dampproofing.

The granite shall at all times be protected from stain and upon delivery at the site shall be kept stacked on timber or platforms at least 4 in. above the ground, until set in place in the wall.

Under no circumstances shall salt be used for thawing out lewis-holes or otherwise in connection with the granite work.

*Note: If carving is to be done by others than the granite contractor same should be noted here—and this specification modified to suit conditions.

Section 23. Setting—Each granite stone shall be brushed clean and drenched immediately before being set. Each piece shall be carefully bedded in a full bed of non-staining mortar and tapped home with a wooden mallet to a full and solid bearing.

The face of the granite work shall be kept free from mortar at all times.

Granite facing shall not in any case be built up more than two courses ahead of the backing and no stone having a greater width of bed than the one below it shall be set until the lower course is backed up.

All surplus mortar shall be immediately raked out to a depth of at least 1 in. and every precaution taken to prevent stones bearing upon the edges.

Sills, etc., subject to pressure, shall be bedded only at the ends.

The cement in the mortar used for setting all granite work where the joint is exposed to the weather shall be made waterproof with a satisfactory waterproofing compound, mixed with the mortar.

The sand used in all setting mortar shall be such as to cause no stain or chemical action with the cement.

Section 24. Anchors, Dowels, etc.—All bolts, expansion bolts, anchors, ties, etc., required in the setting of the granite work, will be furnished to the granite contractor.

All ashlar shall be anchored to the backing with heavily galvanized wrought iron anchors ¼x1¼ in. turned down into the granite 1¼ in. and extending into the backing 8 in. if the thickness of wall permits; the end to be turned up 1½ in. into the backing. There shall be at least two anchors to every stone whose length exceeds its height and in general there shall be not less than two anchors to each superficial square yard of ashlar.

Note: Special anchoring for heavy cornices and overhanging courses, cramps, dowels, etc., for parapets, balustrades, pilasters, and columns, etc., should be suitably described or shown according to the requirements of the work.

Section 25. Boxing and Protection—All granite work must be protected from damage during the progress of the work and until the completion of the building.

The general contractor shall provide the necessary protection, covering all projections, top surfaces, angles, etc., protective boxing to be securely fastened in position and securely nailed throughout with galvanized iron nails. No lumber or material to be used which would in any way stain or deface the granite work.

All necessary forms, centers, scaffolding, etc., required by the setter or carver to be furnished by the general contractor.

Section 26. Pointing and Cleaning—After the completion of the granite work or at such time thereafter as all liability from stain of other operations on the building is passed, and when there is no danger therefrom, the whole of the granite work shall be carefully cleaned down, removing all dirt, mortar, stains, and other defacements.

The use of wire brushes, acids or solutions which might cause discoloration will not be permitted.

All face joints shall be raked out to a depth of not less than 1 in., brushed clean, thoroughly wetted, and filled with pointing mortar and then carefully jointed. The pointing mortar must be packed solidly into all joints, completely filling the same; and the form of joint shall be as directed by the architect.

Vertical joints in the top courses of uncovered cornices having a projection of 8 in. or more shall be filled with mortar by grouting to within 3 in. of the top of the granite, then calked with picked oakum and filled with molten lead, calked against the edges and slightly convex at the top—taking care that the oakum is kept at least 2 in. away from the face and top of granite.

Joints in the upper surfaces of projecting stones which are not so protected and in all platforms, steps and coping, shall be raked out at least 2 in. deep and thoroughly grouted flush with the surface of the granite.

Pointing and cleaning shall start at the top and be continued until such work is completed.

Section 27. Defective Work—No patching or hiding of defects will be permitted. Defective granite stones shall be replaced with perfect ones, except in extreme cases where a stone has been damaged through no fault of the granite contractor, and where it is possible and practicable to remedy the defect without in any way impairing the appearance, strength or durability of the work—and then only with the approval and under the supervision of the architect—and where a satisfactory allowance has been agreed upon which shall be deducted from the contract price.

Specifications—Short Form

The following short form of Granite Specifications has been prepared by the Association for use where a comparatively small amount of granite is required, but where the standards of workmanship and other essentials should conform to the same requirements set forth in detail in the complete form printed on two preceding pages.

(1) **Work Included**—The work to be done shall include the furnishing, delivery, and setting of all granite work required by the drawings and specified herein. (State portions of work to be of granite and note any exceptions about which there might be any question.)

(2) **Material**—The granite shall be sound and of good quality, free from defects which would impair the strength, durability, or appearance of the work, and equal to the approved sample. In estimating, the contractor shall state the name of granite and quarry, upon which his proposal is based. The following granites will be considered: (mention color, tone and grain) granite from (mention locality).

(3) **Samples**—Submit in duplicate, for the architect's approval, samples of the granite showing the extreme variation in quality, color and texture to be used under the contract, and showing the specified finishes.
(State size of sample required.)

(4) **Shop Drawings**—The granite contractor shall prepare all necessary shop drawings, showing in detail the jointing, bonding, and construction of the granite work, and special anchoring. These shall be submitted to and approved by the architect before any cutting is done.

(5) **Finishes**—The exposed surfaces of the granite shall be finished as indicated on the drawings or specified herein.
Note: State finishes desired.

(6) **Cutting**—All exposed surfaces shall be out-of-wind, free from waves, projections, or depressions, and flush at the joints. Arrises shall be cut sharp and true to square or pattern, and continuous with adjoining arrises.

(7) **Bed and Joints**—Beds shall be cut full and square for at least 2 in. from face, and may fall off not to exceed 1 in. in 12 in., reasonably free from large depressions. Joints to be full and square at least 1½ in. from face, falling off not to exceed 1½ in. in 12.

(8) Backs of granite shall be scabbled or split to approximately vertical surfaces.

(9) Jointing shall be as shown on approved drawings, and ¼ in. in thickness.

(10) **Bonding**—Shall be as shown on approved drawings, with no bed less than 4 in. Projecting course shall have beds at least equal to projection, unless otherwise shown.

(11) **Mouldings**—Shall be cut with uniform profile throughout their lengths, in conformity with full size details, with lines true and straight, and flush at joints.

(12) **Washes and Drips**—Washes shall be cut on stones whose top surfaces are exposed, unless otherwise shown. Projecting stone shall have groove drip cut on underside.

(13) Raised seats or lugs shall be cut where stone work rests on projections or washes, and raised thresholds shall be cut on exterior door sills.

(14) Reglets shall be cut for flashing where shown or required.

(15) **Models**—Full size plaster models of all ornamental and carved work shall be furnished to the granite contractor, who shall preserve these models for re-shipment to the building, if required.

(16) **Roughing for Carving**—This shall be done from approved models only, leaving the stone in suitable form and condition for the carving.

(17) **Carving**—All carved ornament shall be executed by skilled carvers, in a spirited and artistic manner, and in strict conformity with the approved models.

(18) **Crating and Shipping**—The finished granite shall be properly crated for shipment, to protect the surfaces and edges of all exposed work.

(19) **Precaution Against Stain**—Precaution shall be taken at all times to protect the granite from stain.

(20) Under no circumstances shall salt be used for thawing out lewis-holes, or otherwise in connection with the granite work.

(21) (If dampproof painting is required, specify requirements here.) After setting, the backs of all mortar joints shall be suitably dampproofed to prevent moisture from the backing seeping through the joints.

(22) **Setting**—The setting of the granite work shall be done by competent, experienced stone setters, and in strict accordance with the approved drawings and specifications.

(23) Each granite stone shall be brushed clean and thoroughly drenched immediately before setting and carefully bedded in a full bed of non-staining mortar. The granite facing shall not be built up more than two courses ahead of the backing, and the faces shall be kept free of mortar at all times.

(24) All surplus mortar shall be immediately raked out to a depth of at least 1 in. Sills, etc., subject to pressure shall be bedded only at the ends.

(25) Where a joint is exposed to the weather, it shall be made waterproof by mixing a satisfactory waterproofing compound with the mortar.

(26) The sand used in all setting mortar shall be such as will cause no stain, or chemical action with the cement.

(27) **Anchoring**—The granite shall be anchored to the backing with galvanized iron anchors, ¼x1¼ in., turned down into the granite 1¼ in., extending 8 in. into the backing if possible, and turned up into the backing 1½ in. There shall be two anchors to each stone whose length exceeds its height and, in general, not less than two anchors to every superficial yard of ashlar. All anchors, bolts, ties, etc., shall be furnished to the granite contractor.
Note: Special anchoring for heavy cornices, and overhanging courses, cramps, dowels, etc., for parapets, balustrades, pilasters, columns, etc., should be suitably described or shown according to the requirements of the work.

(28) **Boxing and Protection**—All the granite work shall be protected by the general contractor during the progress of the work and until the completion of the building. No lumber or material shall be used which will in any way stain or deface the granite work.

(29) **Centers and Scaffolding**—All necessary forms, centers, scaffolding, etc., required by the setter or carver, will be furnished by the general contractor.

(30) **Pointing and Cleaning**—After all liability from stain or damage from other operations on the building is passed, the granite work shall be carefully cleaned, removing all dirt, mortar stains and other defacements. The use of wire brushes, acids, and solutions which might cause discoloration, will not be permitted.

(31) All face joints shall be brushed out, thoroughly wet with clean water, and carefully pointed as directed by the architect.
Note: See Long Form for special treatment of vertical joints in uncovered cornices, and joints in upper surfaces of projecting stones.

(32) **Defective Work**—No patching or hiding of defects will be permitted.
Defective stones shall be replaced with perfect ones, unless otherwise directed by the architect.

ESTABLISHED 1889 INCORPORATED 1924

DEACON BROTHERS, INC.

JOHN R. DEACON, MANAGER

Manufacturers, Cutters and Finishers of Building and Monumental Granite

307-323 Centre Street
QUINCY, MASS.

Materials

We use in manufacturing, the various Quincy Granites from the quarries situated in our home city and granites from other New England quarries.

We make a specialty of carrying a supply of slabs of Goss Pink Deer Isle Granite sawed, polished, and ready to be cut into store fronts and base courses.

Facilities

Our plant is the largest in the city, occupying a whole city block and consists of a modern cutting plant, polishing mill, and saw house.

We are situated so that we can easily ship by rail or water (from Boston) to any point in the United States, and locally by our own motor transportation within 150 miles.

Organization

We are known as the "Quality Manufacturers" on account of the quality of work we produce.

The polish on granite produced at our plant is of the highest gloss obtainable. This quality is *maintained at all times.*

The firm was founded in 1889 by the late William H. Deacon and has been operated continuously by the same family to this day.

Estimates

Estimates on granite work and samples on request.

1944	1945.5	1945.5	1945.5	1.5	.07

The weight is the same after a week as it is after an hour. Gain in weight appears to be due to surface moisture only; no moisture being absorbed.

Uses

Building construction of every kind. Facings, doorways, steps, window trim, stairways, sills, floor tile, columns, mantels, fountains, and all other structural and memorial purposes.

Quarries

Located within convenient proximity to the cutting plant in Cold Spring, Minnesota. Are fully developed and completely equipped with the best and most modern quarry machinery available. The drilling and broaching system of quarrying is used exclusively, instead of blasting, which eliminates all possibility of shattering. The size of blocks obtainable is limited only by the restrictions of railroad transportation. Our derricks have lifting capacity of more than 100 tons. The granite is not affected by weather conditions and quarries and finishing plant operate throughout the year.

Finishing Plant

Our cutting plant is one of the largest and best mechanically equipped in America. Capable of handling promptly and efficiently contracts of any size. Have capacity for handling single pieces of more than 75 tons. Modern gang saws, circular carborundum saws, planers, and various kinds of up-to-date machines are employed in the production of cut granite in this plant and many different finishes are produced entirely by machinery, thereby effecting substantial savings over the old and expensive hand methods. A large stock of blocks, also sawed and polished slabs, from one inch in thickness up, is maintained at all times, assuring prompt delivery of finished work.

Service

The COLD SPRING GRANITE COMPANY, INC., having in its production, estimating, sales, drafting, traffic and other departments, men experienced and trained in their respective lines and with a sincere desire to co-operate in the fullest measure with architects and contractors, offers a complete and efficient service in the use of Granite.

Preliminary estimates, information, and samples will be gladly furnished without obligation.

An illustrated catalogue containing detailed and technical information will be mailed upon request.

Cold Spring Rainbow Granite

Is variegated in color, of a warm general tone ranging from deep black to dark red, but containing, as its name implies, all the colors of the rainbow in beautiful and varying combinations. It is of fine texture and one of the hardest granites produced. Takes a high and permanent polish, is suitably adapted to fine carving and ornamentation. It is truly distinctive and outstanding among all granites. It is especially desirable for columns and interior as well as exterior work.

Cold Spring Pearl Pink Granite

Of medium texture, rich and pleasing color tones consisting of a combination of pink, buff, pearl, white and black which blends into almost any architectural setting. It is exceedingly hard, takes a high and permanent polish, and is impervious to stains or discolorations. Hammered finishes produce a warm gray tone. Lends itself readily to fine carving and other forms of ornamentation.

THE DOLBEN QUARRIES

Weymouth Seam Face Granite

DOLBEN & COMPANY

7 Water Street

BOSTON, MASS.

QUARRIES AT WEYMOUTH, MASS.

Address All Correspondence to Boston Office

Products

SEAM FACE GRANITE ASHLAR.

SPLIT FACE GRANITE ASHLAR.

Seam Face Flagging and Stepping Stones; Special Arches, Lintels and Sills, cut according to drawings; Jambs, Quoins, Steps, Copings, etc., of special sizes for trimming walls faced with ashlar.

Facilities

The facilities of this company are adequate to handle operations of any kind.

Nature of Stone

A true granite of great strength, found in nearly upright sheets of various thicknesses. Seams between these sheets provide faces for the blocks into which the stone is cut. Permanent in texture and color.

Split face granite is produced by splitting blocks after quarrying. Surface is generally a little rougher than seam face. Splits evenly and requires no dressing or pointing.

Colors of Stone

The range of colors is wide, and includes grays, buffs, tans, browns, greens, and purple.

Color of seam face ranges from light gray to dark brown and purples. Color of split face granite is warm gray. Color group is optional.

Sizes

The blocks are produced in varying sizes.

The faces range from 4 to 14½ inches in height, thickness from 4 to 8 inches, and lengths are random.

Uses and Cost

The natural stone for churches, country residences and public buildings, it can be obtained in the texture and color desired at moderate prices.

Method of Laying

This granite is especially adapted to three and four-head ashlar work, and equally well to coursed ashlar.

The quarry cost per square foot is the same for either method of laying, but laying cost is lowest for coursed ashlar and highest for three-head.

Estimates and Samples

Estimates and samples are supplied promptly to architects, owners and contractors.

Flagging

For paving of courts, terraces and garden walks or other landscape features there is no stone equal to seam face granite. It is generally used in irregular shapes but can be cut to rectangular. Thickness is under 4 inches and surfaces have the full range of seam face colors.

JOHN L. GOSS CORPORATION

Producers of "Goss Pink Deer Isle Granite"

QUARRIES AND HOME OFFICE
STONINGTON, MAINE
SALES OFFICE, 77 Summer Street, BOSTON, MASS.
SALES AGENTS
NEW YORK, N. Y., A. Le Poidevin & Co., Inc., 286 Fifth Avenue PHILADELPHIA, PA., Frank Williamson, 2302 Spruce Street
MIDDLE WESTERN TERRITORY, Wm. H. Mitchell, 30 Church Street, NEW YORK, N. Y.

Product

Goss Pink Deer Isle Granite, for buildings, memorials and general construction, polished, hammered, pointed or rock-faced.

Trade-name

Deer Isle granite has been used for many years under a variety of names, such as Greens Landing, Stonington Pink, Maine Pink, Crotch Island, Deer Island, and others, and has been produced by a number of quarries operating in the Deer Isle district from time to time.

The Crotch Island quarry of John L. Goss Corporation was opened in 1870, and has been operated continuously to this day. Thorough development insures the same high quality of stock for years to come. To distinguish the product of this one quarry from that of all others, and to identify it as a standard of quality, the name "Goss Pink Deer Isle" was adopted.

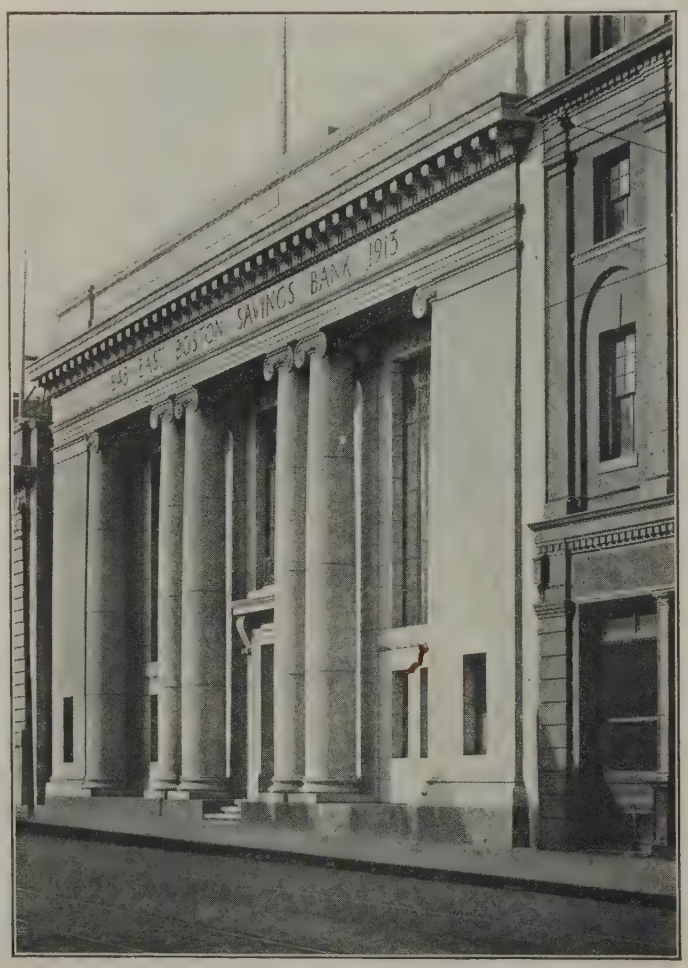
Service Available

Any responsible manufacturer or dealer can supply this material. The rough granite is shipped to finishing plants all over the country, which are equipped to furnish all classes of work. A large number of plants carry stocks on hand, and the quarry always stands ready to supplement these with prompt shipments of any sizes, shapes or quantities. We will be pleased to assist you in getting in touch with subcontractors in position to handle your particular project to best advantage, or to give preliminary estimates.

Facilities for Production

The natural advantages of the quarry site—a free working formation, so located that the product travels the short distance to our tidewater dock by gravity—are supplemented by the best of modern equipment: derricks, compressors, air tools, etc., which are constantly being improved, replaced and kept up-to-date.

This makes it possible to give prompt deliveries on large or small orders, and to furnish monoliths of any size that may be desired. We ship by water directly from our quarry dock to seaport cities, or deliver to the railroads at Rockland, Me.; Portland, Me.; Boston, Mass.; Philadelphia, Pa., and Wilmington, Del.



East Boston Savings Bank, East Boston, Mass.
Thomas M. James, Architect
Granite by John Harrington

Color and Texture

The natural scale color plates on the following page show polished and hammered surfaces. Rock-faced work has a tone between the two but with a very rugged character. For base courses, especially where subjected to accumulation of dirt or stain, we recommend a polished surface. A rubbed or honed finish gives some of the same advantages but is without the high gloss. For most general purposes, and especially in connection with moulded members or carved details, a hammered finish is advised. A pointed surface is an interesting but inexpensive finish with strong texture.

Compressive Strength

Tests by the United States Ordnance Department give a compressive strength of 23,620 pounds per square inch. This is well above all structural or code requirements.

Advantages

Goss Pink Deer Isle granite is readily available in any quantities at all times. It can be specified by name without losing the advantages of competition since it is so generally distributed. The rough material is a small part of the cost of the finished work, and any number of competing bids can be obtained on each project.

It is especially desirable in combination with other materials. The warm delicate shade harmonizes well with limestone, bronze, brick and other granites. It lends itself well to bold rock-faced work, tooled or carved details, or to polishing.

It is a peculiar characteristic of this granite that it retains its freshness for a long period and does not readily become soiled or discolored. This is a most useful quality in and around cities where there is an excess of soot and smoke.

Specifications

We suggest that you use the form recommended by the National Building Granite Quarries Association on another page of this book, inserting the finish desired, and in place of Section 2—"All granite shall be Goss Pink Deer Isle Granite from the quarry of John L. Goss Corporation at Stonington, Maine.

H. E. FLETCHER COMPANY

Producers of Granite

WEST CHELMSFORD, MASS.

Products

CHELMSFORD WHITE GRANITE.
CHELMSFORD GRAY GRANITE.
CHELMSFORD "BULFINCH" GRANITE.
MILFORD (N. H.) GRANITE.

DIMENSION, CUT, RUBBLE and CRUSHED GRANITE for buildings, bridges, roadways, sea-walls, docks and dams.

DIMENSION GRANITE, in carloads for mausoleum and monumental work.

PAVING BLOCKS, CURBING, SEWER INLETS and CRUSHED GRANITE for municipal work and for "FLETCHERMIGHT" pavement.

Chelmsford White Granite

A grayish-white granite which weathers well and is widely used for building and bridge work.

Chelmsford Gray Granite

A well-known standard light gray granite for building and memorial work.

Weathers equally as well and is finer grained than Chelmsford White.

Both granites, when bush-hammered, are almost unequalled in retaining their light, almost white color even after years of exposure.

Chelmsford "Bulfinch" Granite

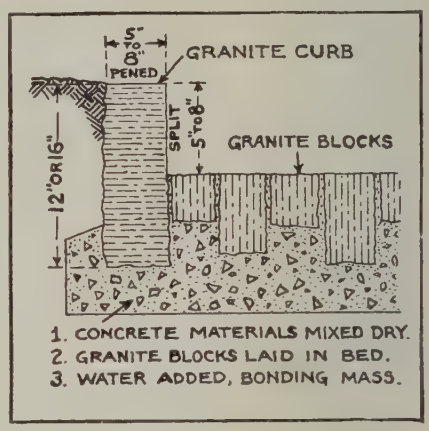
A varied light grayish-buff colored granite used for many years in Colonial structures. A notable example is University Hall, of the Harvard University group at Cambridge, Mass., designed by Bulfinch and built in 1813. This famous building stands today, an example of the splendid weathering qualities of Chelmsford Granite. Chelmsford "Bulfinch" Granite has been used in recent additions to this group.

Paving Blocks and Curbing

We are one of the principal producers of paving blocks and curbing, and make a specialty of delivering curbing on the street in correct position for setting and in the shortest possible time.

"Fletchermight" Pavement

We are presenting to the attention of the public a new pavement, called "Fletchermight" after a vote by the road builders of America. This is designed for heavy motor traffic on main trunk highways, and is protected by patent No. 1,573,923, Feb. 23, 1926. The sketch at right shows the general construction and use of granite curbing with this pavement.



Facilities

Nearly fifty years of expert quarry development has produced free quarry faces containing millions of feet of clear granite, all available for immediate quarrying under numerous derricks. With unexcelled railway facilities, and adequate cutting plant, this means that the largest contracts can be easily and promptly handled. We do no polishing work at this plant, but are in a position to furnish saw blocks to polishing plants for quick delivery.

Organization and Service

Our organization has been built up of men having long experience in granite production and includes business, traffic and technical experts who have made intensive study of the requirements for giving satisfaction and service to purchasers of our products.

Recent Contracts

Camden Anchorage and Plaza, Philadelphia and Camden Bridge
Soldiers and Sailors Memorial Bridge, Harrisburg, Pa.

The H. E. Fletcher Quarry at West Chelmsford

ESTABLISHED 1826

GRANITE RAILWAY COMPANY

Quarriers of Granite Railway Syenite

1535 Hancock Street, QUINCY, MASS.

The Company

In 1826 the GRANITE RAILWAY COMPANY was organized and chartered by the Commonwealth of Massachusetts, for the dual purpose of quarrying stone and transporting it by railway to the Neponset River, whence it was taken by vessels to all parts of the Atlantic coast from Maine to Louisiana. The railway which was built in 1826 was *"The First Railway in America."* For a half century the Company operated both its quarries and railway, then it gave up its railway and devoted its entire energies to the quarrying side of the business.

Bunker Hill Monument
Construction started 1826

Syenite

Railway granite is really a syenite composed of quartz, feldspar and hornblende and takes its name from Syene in upper Egypt where the similar stone so extensively used by the ancient Egyptians was quarried. The hornblende makes it very hard and durable. Even after a hundred years of such a variable climate as is found in New England, Railway Syenite fails to show the slightest trace of disintegration. Two good examples of this are Bunker Hill Monument and Minot's Ledge Light.

The syenite from the quarries of the GRANITE RAILWAY COMPANY is taken from strata far below the surface of the ground. Every block is closely examined, and any that is not perfect in color and texture is discarded. Two standard shades of color, dark and extra dark, give the architect a choice permitting considerable flexibility in chromatic design.

The Quincy syenite first used in buildings was selected for its hardness and its permanence. While stone polishing is one of the oldest arts, the methods were at first rough and crude, making the cost of polishing too great to permit of the use of large polished surfaces in building construction. It was early recognized, however, that Quincy syenite when polished presents a uniquely beautiful surface, unusually dark in color, yet with far more lively a sparkle than is ordinarily associated with so dark a material. The beauty of this polished surface, together with the contrasting gray of the hammer-finished stone, led gradually to a larger and larger part of the output of the Quincy syenite being used by monument manufacturers.

In recent years changing conditions once more offer an opportunity to the architect to obtain new distinction of design by the use of this same Granite Railway stone which was so widely used for structural purposes two, three or four generations ago. Not only does the modern steel-framed building permit the use of much thinner veneers than was feasible in the days when masonry walls were all bearing walls, but also the methods and machinery for polishing stone have so improved that it is now possible to polish large surfaces of granite at greatly reduced cost. At the same time saws have been devised which enable the granite manufacturers to cut the solid block into veneers of almost any thickness desired. Owing to its hardness and strength, and the ease with which it can be cleaned by simple washing, polished Granite Railway syenite is especially adapted for use as a facing on the lower stories of buildings that are subject to the dirt of the streets and likely to be chipped by the wear and tear of passing traffic.

The beautiful dark color of its polished surface contrasts well with lighter stone in upper stories. As the setting for windows and doorways, for bronze and iron grill work, for marble carving or panels, polished Granite Railway syenite provides a background which brings out the contrasting detail subordinating its own intrinsic beauty.

Service to Architects

THE GRANITE RAILWAY COMPANY desires to place its skill and knowledge of the possibilities of syenite granite at the service of the architect and contractor. It welcomes, therefore, inquiries about the use of granite in any way. The knowledge of the various applications of syenite possessed by this company enables it to suggest economical and efficient new ways of using its granite both in the ashlar and in the massive block. In fact, new uses for the employment of syenite granite are constantly being developed. Let us solve your problems.

Recent Buildings

Some of the most recent examples of the use of Granite Railway syenite in modern building construction may be seen in the Parker House, Boston, Mass.; Palmer House, Chicago, Ill.; National Mt. Wollaston Bank, Quincy, Mass., and the McCrory Five and Ten Cent Stores, Dayton and Youngstown, Ohio.

MOUNT AIRY GRANITE CUTTING COMPANY
Mount Airy, N. C.

Products

DIMENSION GRANITE for Buildings, Mausoleums, Monuments, Bridges, Dry Docks, etc.

POLISHED and TURNED GRANITE.

GRANITE PAVING BLOCKS, STREET CURBING, CROSSWALK, RUBBLE, CRUSHED GRANITE and RIP RAP.

The Association and Its Object

The aim of this Association is to jointly promote the use of Mount Airy granite for all purposes where granite is adapted. The individual members will cooperate with architects, engineers, contractors or owners in matters relating to the use of granite, samples, specifications, estimates, etc.

Quarry Production

The quarries were first opened in 1889, the first shipment being made in July, 1890; the output for that year being 135 carloads and has increased rapidly to a maximum output of 3500 carloads in one year.

Cutting plants and offices are located at the base of the Mount Airy quarries and are equipped with the latest improved machinery for the manufacture of granite, including electric traveling cranes, polishing machinery and turning lathes with individual motors, sand blast and carborundum machines, also compressed air for the pneumatic surfacing machines and hand cutting tools. These plants, taken together with the unlimited supply of rough granite available, enable large contracts to be executed in quick time.

Geographical Location

The Mount Airy quarries are well situated in reference to shipping, being about an equal distance from New York City, New Orleans and Chicago; which fact guarantees a reasonable transportation cost on their material to points throughout the East, South and Middle West. These quarries are served by the Southern Railway and have a nearby connection with the Norfolk & Western Railway.

Patterson Memorial, Dayton, Ohio

Owing to natural advantages peculiar to Mount Airy quarries, Dimension Stone of unusual size is easily obtained, only limit being that of railway transportation.

Facilities

The Mount Airy quarries are located one miie east of the Town of Mount Airy, N. C., and have 70 acres in exposed granite area.

Moulding and Carving

Owing to the composition of Mount Airy granite, it is especially adapted for fine moulding, carving and sculpture work, attested by reference to the following:

Pennsylvania State Monument, Gettysburg, Pa.

Column Capitals of the North Western Life Insurance Building, Milwaukee, Wis.

Column Capitals and Panels of the Municipal Building, New York, N. Y.

Colors and Texture of Mount Airy Granite

Mount Airy granite, *"The Granite of Individuality,"* is a very light gray, almost white, biotite granite of medium texture. Feldspar, quartz and mica characterize the granite megascopically.

The feldspar is nearly white, while the quartz is a blue gray and the mica black and very evenly distributed, giving an appearance of decided strong character when hammer dressed.

The composition of Mount Airy granite is indicated by the following Chemical Analysis:

SiO_2	70.70
Al_2O_3	16.50
Fe_2O_3	2.34
MgO	0.29
CaO	2.96
Na_2O	4.56
K_2O	2.45
FeS_2	0.09
Total	99.89

Weight per cu. ft..... 165 lbs.
Water absorbed per cu. ft..... 0.33 lb.
Crushing strength....23,068 lbs. per sq. in.

From Bulletin No. 2, page 155, North Carolina Geological Survey, "The building and ornamental stones of North Carolina." Joseph Hyde Pratt, State Geologist.

Estimates and Samples

A complete organization is maintained by each member of this Association for furnishing estimates, setting plans, details, etc., on short time.

Preliminary estimates cheerfully furnished on request of architect or contractor.

Samples of Mount Airy granite will be furnished on request, and advice as to grade or style of finish desired.

MEMORIALS of all kinds in GRANITE, MARBLE and BRONZE, ranging from monumental pieces of public interest to the simplest of private tributes.

Mortuary Art

Individual tastes are as diversified as the art itself but, whether the desired effect is dignified elegance or impressive simplicity, we are truly prepared to serve the best interests of our clients in an efficient and able manner.

Design and Architectural Departments

Wide experience in our field has fitted us to offer design suggestions, sketch studies, etc., and we are glad to co-operate with the architect by placing the facilities of these departments at his disposal.

Construction and Erection Facilities

Eighty years of "knowing how," careful personal supervision, and our complete and extensive cutting facilities enable us to set and maintain a high standard of workmanship and design.

The Harrison plant is electrically equipped and contains all the modern tools and appliances necessary to the production of well-finished, artistic monuments.

Our erection facilities are of the best and this work is entrusted only to those who have demonstrated their ability to grasp and execute the lofty concept of the architect who designed the monument they are to build.

Producers of "Shastone" Special Granites

97-115 Harrison Place and 96-114 Ingraham Street

BROOKLYN, N. Y.

Products and Services

"SHASTONE" GRANITES for building exterior work, memorials, mausoleums and monuments.

FOREIGN GRANITES from Norway, Sweden, Finland and Labrador.

GRANITE CUTTING and SHAPING.

POLISHING, a specialty.

"Shastone"

The world's selected granites, foreign or domestic, noted for their beautiful colors, flawlessness, durability and all other fine qualities which make their use adaptable for highest grades of monumental and architectural purposes.

The illustration is a reproduction of the famous American Radiator Building, situated in the heart of New York. The use of "Shastone Black" at the base and first three stories, added so much to the external beauty of this modern cathedral of commerce.

"Shastone" polished granites have demonstrated their ability to resist the action of the elements in any climatical condition, are non-absorptive and non-staining. They are therefore specially commendable for all exterior decorative work and memorials, which are subject to dust and dirt.

The trade-mark shown above is a guarantee for quality and genuineness. Every stone that leaves the firm's yards bears the "Shastone" trade-mark.

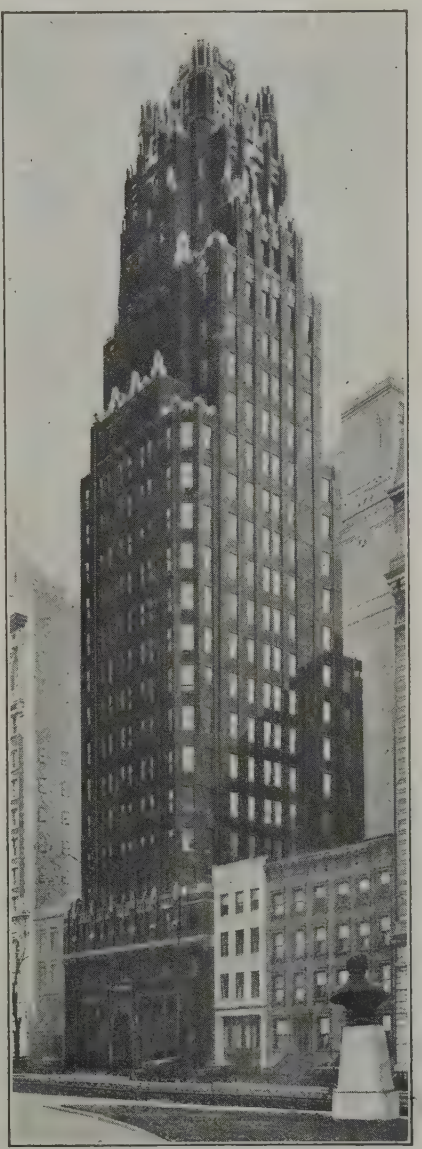
Polishing

"Polish Expresses the Beauty of Granite."

It is the genuine polished surface of granite that is the effective means of preservation and preventive of surface deterioration against the action of the elements and staining from dust and dirt.

Shastone Polishing Plant—Our polishing plant is one of the largest in the world. It is equipped with every imaginable device for the production of a high class polish. Our polishing machines, singularly devised by our engineering department, cannot be surpassed by any other polishing machines in the world and have made it possible for us to bring down the cost of polishing equal to that of ordinary hammering.

The cost of polished granites for exterior decorative purposes which hitherto has been almost preventive has now been decidedly moderated and has therefore popularized their use.



American Radiator Building
RAYMOND M. HOOD, Architect
The exterior work at the base and first three stories of this modern cathedral of commerce is "Shastone" Black Swedish Granite as specified by the architect. It harmonizes and is an integral part of this example of modern structural design

Colored Granites

We carry in stock both foreign and domestic granites of a large variety of colors (white, black, gray, red, green, etc.).

We are prepared to furnish all details, descriptions, prices and recommendations on the special requirements of any architect or contractor.

Location and Shipments

Conveniently located in Brooklyn, we are able to make prompt deliveries in any quantities, as required. We are also prepared to make shipments to any part of the country. We furnished the granite for numerous buildings all over the United States and Canada.

Architect's Service

We are at all times prepared to co-operate with the architect in his problems and will cheerfully furnish estimates on work contemplated or in construction.

Westerly Granite

Westerly Granite is available in several colors; blue, gray, pink and red. All are capable of hammered or polished finish and are desirable where carved ornament or letters are used. It is especially recommended where excellence of workmanship and permanence are desired.

Other Granites

Concord Granite, light gray, and Deer Isle Granite, pinkish gray, are available in large sizes and quantities.

Quincy Granite, dark gray, is available for polished work for near-black effect.

NORTH STAR GRANITE CORPORATION

Quarriers and Fabricators of Granite for Building Purposes

MAIN OFFICE, DRAFTING ROOMS, PLANTS AND QUARRIES

ST. CLOUD, MINN.

CHICAGO OFFICE: 105 S. Dearborn Street

Granites Obtained from Our Quarries

"Original Minnesota Pink"—Coarse grained. Used extensively on building work. Reasonable in price. Crushing strength over 20,000 lb.

"Pioneer Dark Gray"—A very good dark granite.

"Indian Red" or "North Star Red"—Very good where color is wanted.

Modern Machinery for Fabrication

Our plant is equipped with the latest type circular saws, carborundum machines and other fabricating machinery. Excellent service is rendered to contractors on building granite.

Prices, samples, suggestions gladly given gratis to architects.

Fisher Building, Detroit, Mich.

ALBERT KAHN, Architect

There are four stories of polished "Original Minnesota Pink" Granite in this structure. Granite was quarried in three and a half months and manufactured in three plants in record time. The contract was awarded on Nov. 1st, 1927, and the last car of granite shipped before the end of May, 1928. This is only the first unit—there will be another one the same as this, then the center portion with a tower of fifty-six stories

PLYMOUTH QUARRIES INCORPORATED

Specialists in Ashlar

755 Boylston Street
BOSTON, MASS.
SHIPPING POINT: EAST WEYMOUTH, MASS.

Products

ASHLAR, in Seam Face and Split Face Granite.

FLAGGING and STEPPING STONES, in Seam Face Granite.

Seam Face Ashlar

The geological formation of our material is unique in that the rock mass has been sheared and tipped, so that it now stands in vertical sheets. The seepage of vegetable and mineral solutions through the seams between sheets has produced a wide range of coloring on the faces of the seams ranging from the natural gray through buffs, tans, yellows, greens and browns to a very dark brown and dusty purple.

By using the face of the seams as the exposed face of the stone in the building, a very interesting texture and coloring is obtained, and since these are the result of natural causes, a permanent and natural effect of age is immediately obtained on new construction together with the feeling of strength characteristic of granite.

The seams in the quarry have in no way affected the strength of the granite, which together with the fact that our granite is practically non-absorptive, make it an ideal building material.

Split Face Ashlar

Our Split Face Ashlar is obtained by splitting the blocks and using the split face as the exposed surface. The texture is somewhat rougher than Seam Face, but is not a rock face in any sense.

Although the variation in color is not as wide as in Seam Face, the Split Face colorings, ranging from the grays through the light tans and buffs to the light browns, give life and warmth to this material.

Where Seam Face and Split Face Granite Can Be Used

Plymouth Quarries products, both Seam Face and Split Face, can be used for all purposes for which ashlar is suitable: walls, both exterior and interior; jambs; lintels (if not too large); slip sills; steps, etc.

Flagging and Stepping Stones

Flagging and stepping stones can be obtained only in Seam Face. The surface is sufficiently smooth to be very suitable for both interior flooring and for garden walks, etc., and has all the variety of color of the ashlar.

Allow at least 5 in. for bed and flagging.

Thickness and Height of Ashlar

The thickness of the ashlar varies from 4 to 8 in. thick.

In height it is generally used from 5½ in. to 1 ft. 1 in. rises, though higher rises can be obtained, if desired, in limited quantities.

Cost of Ashlar

The natural seams in this formation together with our organization and equipment enable us to produce a granite ashlar at a minimum cost, so that we can compete with local stone over a very extended area.

Specifications

The following specifications are our standard and are intended to so describe the material that it will meet the requirements of ashlar work in general, either artistically, structurally or economically.

Changes in our standard sizes, limitations in color and changes in the manner of cutting can of course be made within reasonable limitations.

Ashlar—Squared up as to rise and length ready to set with beds, builds and joints formed with pitching tool.

Rises—5½ to 11½ in. with smaller stones for jinks if required.

Lengths—One and one-half times the rise or more.

Thickness—Random from 4 to 8 in., averaging 6 in.

Heads or Corners—Split or rough pointed with returns of 4½ to 8½ in. or more.

Reveals of Jambs, Lintels and Arches—Split or rough pointed and cut ½ in. less than actual reveal leaving joint for plumbing frame, etc.

Sills—Slip sills without lugs seam face wash split face rise.

Color and Texture—Seam face: color, quarry run or restricted; texture smooth, average or rough.

Split face: color gray, sappy and mixed; texture, projections up to 1 in.

Cutting

We seldom cut to a setting plan as we have found from experience that although pleasing effects as to distribution of sizes may be obtained, it is difficult to interpret color and a more pleasing result as to both sizes and color is obtained by having the setters at the job interpret the architect's ideas.

Setting

We have a construction department with a thoroughly competent organization for setting our material and the cut stone trim, and we will either quote on setting or give any help we can to contractors bidding on the setting.

Handling Material

Ours is a very tough close grained granite and is not easily chipped or broken. We have found that the stone may be dumped from a dump truck with little if any breakage and at a considerable saving in hauling cost. Special stones such as sills, lintels, arches, etc., or any stone cut to plan should not be dumped. Nearly all of the stones are one-man stones and the largest can easily be lifted by two men.

Mortar

We have found the following to be a good setting mortar with our stone. One part cement to 3½ or 4 parts sand with lime equal to 15% to 20% of the volume of cement added. This mortar should be well mixed and wet enough to be plastic but not as wet as soft stone mortar, as the granite is practically non-absorptive. Joints should be well raked out and pointed with mortar of 1 cement to 2½ to 3 of sand and 5% to 10% lime. Non-staining cement is not necessary with our stone.

Joints

Our material is not a cut stone and is usually used as ashlar where a comparatively informal effect is desired. The joints should not be less than ½ in. and in general should be about ¾ in. with slight variations allowed.

Anchors

The variation in thickness of our material gives a good masonry bond if the setters are at all careful. In nearly every city our ashlar is considered as part of the bearing wall in general, anchors are not necessary.

Tests

Compression tests on our material made at the U. S. Arsenal, Watertown, Mass., Sept. 5, 1910 show 35,000 to 40,000 lb. per cu. in. for our gray granite and 26,000 to 27,000 lb. per cu. in. for colored granite.

The following extracts are from a report on the Plymouth Quarries made by Prof. W. O. Crosby and Dr. G. F. Loughlin, of the Department of Geology of the Massachusetts Institute of Technology.

Quality—The feldspar is nearly as hard as steel, and is free from soft kaolin spots, such as would cause pitting on exposure to the weather. It is a very important fact that the jointing of the granite does not tend in any slightest degree to make it shaly or impair its strength.

Fire Resistance—Flame tests demonstrate that this granite, and especially the seam face variety, is, to a good degree, proof against the scaling and cracking to which granites in general are so subject on exposure to fire.

Absorption—While the absorption is remarkably low for the seam face granite, the fresh, or white granite is virtually non-absorptive. The low absorption ratio makes freezing tests wholly unnecessary; and this conclusion is fully confirmed by an examination of the natural ledges, which are singularly free from distintegration or scaling due to frost action.

QUARRIES: ROCKPORT, BAY VIEW AND PIGEON COVE, MASS.; JONESPORT, ME.

Products

Rockport Gray (Light, Medium and Dark), Rockport Sea Green and Moose-A-Bec Red Granites for the better class of buildings and memorials.

Seam Face Granite for residences and churches.

Also Granite for bridges and sea-walls; Granite Paving Blocks and Crushed Stone.

Rockport Granite

Rockport Granite—"The Granite of Character"—is a true hornblende granite, resembling in composition the Egyptian granite of which the ancient obelisks and sarcophagi were built. It is strong beyond all possible requirements, and is decidedly hard and tough. It is remarkably free from impurities, is practically impervious to moisture or stain, and will withstand indefinitely the action of frost and weather.

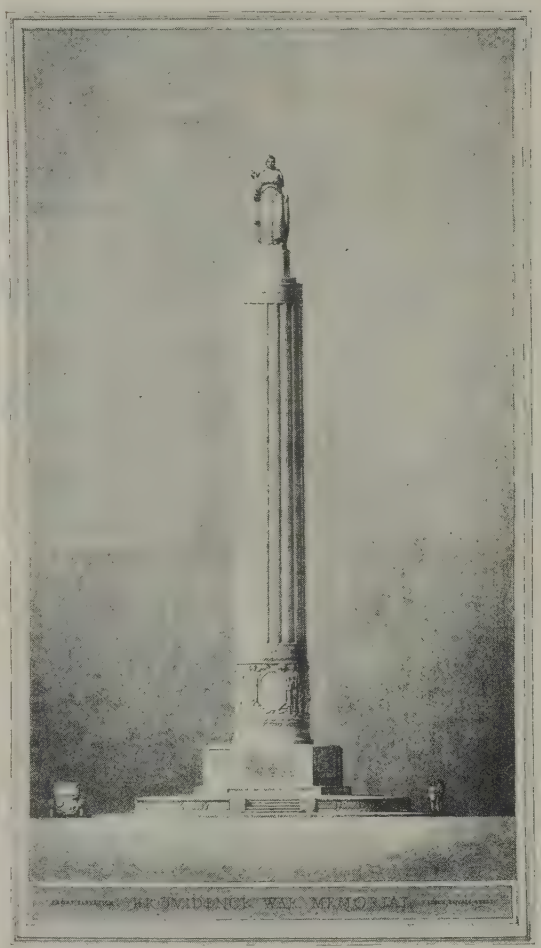
One of the outstanding qualities of Rockport Gray and Rockport Sea Green Granites is the exceptionally high and durable polish which they take, due largely to the hornblende in their mineral composition.

Rockport Gray Granite—Is available in light, medium and dark gray shades, with a medium to coarse and even grained texture.

Rockport Sea Green Granite—Has practically the same physical properties as the gray. In color it is dark olive green, spotted with black. It is especially beautiful in polished finish, although used extensively for hammered work as well.

Moose-A-Bec Red Granite—Is a beautiful dark reddish gray, biotite granite, with a mixture of white and pinkish feldspars. It has a coarse, even grained texture, and takes a beautiful polish. While slightly more expensive than the gray or green, its coloring makes it very desirable where a richly colored granite is wanted.

Rockport Seam Face Granite—Is available in a mixture of light to very dark reddish, rusty browns, and makes wonderfully attractive ashlar work for residences, churches, etc. Unlike most seam face granites, the color runs deep into the stone and it can therefore be used for headers, sills, steps, etc., as well as for ashlar surfaces.



Providence War Memorial, Providence, R. I.
Paul P. Cret, Architect C. P. Jennewein, Sculptor
Entire Memorial of Rockport Moose-A-Bec Red Granite

Facilities

The plants and quarries, comprising more than 800 acres, are located at Rockport, Bay View and Pigeon Cove, Mass., and Jonesport, Me. The company also owns its own docks, and a fleet of vessels, including sloops, schooners, barges, towboats, and lighters. With facilities for both rail and water shipment, the company is in an exceptional position to render first class service, both to seacoast and inland points.

In the several quarries are located forty large power derricks, many of which are of 75-ton capacity and over. Drilling is done with modern appliances using compressed air or steam. The quarries and plants at Rockport, Bay View, and Pigeon Cove are interconnected by rail and heavy capacity motor trucks.

The cutting plants are well equipped with modern tools and appliances, pneumatic tools and drills, pneumatic surfacing machines, lathes, etc. The large modern polishing plant is completely equipped with polishing wheels, polishing lathes and pendulum polishers.

In normal operation, from 600 to 800 men are employed by the Company.

Color Reproductions, Samples and Estimates

The color reproductions of our granites, on the following page, are submitted for preliminary selections. They are full size as to texture, and approximate as to color. Samples will be furnished to architects on request. Opportunity is solicited to submit prompt and reliable estimates from plans and specifications.
